REPORT
OF THE
INDUSTRIAL COMMISSION
ON THE RELATIONS AND CONDITIONS OF
CAPITAL AND LABOR
EMPLOYED IN
MANUFACTURES AND GENERAL BUSINESS
(SECOND VOLUME ON THIS SUBJECT),
INCLUDING
TESTIMONY TAKEN AFTER NOVEMBER 1, 1900, WITH REVIEW
AND DIGEST THEREOF, AND A SPECIAL REPORT
ON DOMESTIC SERVICE.

VOLUME XIV
OF THE COMMISSION'S REPORTS.

WASHINGTON:
GOVERNMENT PRINTING OFFICE.
1901.

MEMBERS OF THE INDUSTRIAL COMMISSION.

Mr. ALBERT CLARKE, *Chairman.*

Senator BOIES PENROSE.	Mr. ANDREW L. HARRIS.
Senator STEPHEN R. MALLORY.	Mr. JOHN M. FARQUHAR.
Senator JOHN W. DANIEL.	Mr. EUGENE D. CONGER.
Senator THOMAS R. BARD.	Mr. THOMAS W. PHILLIPS.
Representative JOHN J. GARDNER.	Mr. CHARLES J. HARRIS.
Representative L. F. LIVINGSTON.	Mr. JOHN L. KENNEDY.
Representative JOHN C. BELL.	Mr. CHARLES H. LITCHMAN.
Representative THEOBALD OTJEN.	Mr. D. A. TOMPKINS.
Mr. WILLIAM LORIMER.	

E. DANA DURAND, *Secretary.*

[Extract from act of Congress of June 18, 1898, defining the duties of the Industrial Commission and showing the scope of its inquiries.]

Sac. 2. That it shall be the duty of this commission to investigate questions pertaining to immigration, to labor, to agriculture, to manufacturing, and to business, and to report to Congress and to suggest such legislation as it may deem best upon these subjects.

Sac. 3. That it shall furnish such information and suggest such laws as may be made a basis for uniform legislation by the various States of the Union, in order to harmonise conflicting interests and to be equitable to the laborer, the employer, the producer, and the consumer.

INDUSTRIAL COMMISSION,
December 5, 1901.

To the Fifty-seventh Congress:

I have the honor to transmit herewith, on behalf of the Industrial Commission, a report on the subject of the Relations and Conditions of Capital and Labor Employed in Manufactures and General Business, prepared in conformity with an act of Congress of June 18, 1898.

This is the second report of the Commission on this subject, the first constituting Volume VII of its reports. The present volume includes the testimony taken before the Commission from November 1, 1900, to the end of its term of office, together with a review and digest of the testimony, and a special report on the subject of Domestic Service.

The conclusions and recommendations of the Commission regarding this subject will be presented in its final report to Congress.

Respectfully,

ALBERT CLARKE, *Chairman.*

REVIEW OF EVIDENCE

OF

VOLUMES VII AND XIV.

The following review covers the evidence taken by the Commission on the conditions of capital and labor in manufactures and general business, which is contained in Volume VII of the Commission's reports, as well as that contained in the present volume. A considerable amount of evidence relating to these topics is included in volumes primarily devoted to other subjects. Volumes I and XIII, on industrial combinations in particular, touch largely on the more general topics to which Volume VII and the present volume are devoted.

GENERAL CONDITIONS OF BUSINESS.

All the testimony taken by the Commission goes to show that business is in a much more prosperous condition at the present time than was the case in the years immediately following the depression of 1893. So far as is evidenced by the testimony, there is not a single industry which has not shared to some extent in the business revival, and the general prosperity has been reflected in retail trade.¹ Not only is this true, but with very few exceptions the different industries are reported to be enjoying a very large measure of prosperity at the present time. The principal exceptions to the rule are the cotton and woolen trades, in both of which there seems to have been a greater volume of production than could be readily consumed. Severe competition in the boot and shoe trade and in the silk industry are reported to have so affected prices as to make close figuring necessary in order to realize a profit,² and the conditions are not wholly satisfactory to the manufacturers, though in both cases trade appears to be brisk.

The uncertainty of statistics of production, due to duplications, is pointed out by Mr. Carroll D. Wright,³ but as similar conditions have always existed it is possible to make fairly accurate comparisons between different periods.

The revival of business has been accompanied by a rise of prices in most instances, according to the general rule which is held to prevail,⁴ but this has not been invariably the case.

TRUSTS AND INDUSTRIAL COMBINATIONS.

Special attention has been given elsewhere to matters pertaining to trusts and industrial combinations.⁵ Some little testimony relating to this subject has, however, been given by witnesses, speaking in reference to general business conditions, and is therefore included in the present volume.

Advantages and disadvantages—Effect on prices.—There appears to be a wide difference of opinion on the part of both employers and employees as to the effect of industrial combinations on industrial life. On the one hand, it is contended that industrial combination is a natural evolution of business and is conducive to the prosperity of the country; that the formation of industrial combinations tends to cheapen the cost of production, and that in the end the consumer will profit from this through the

⁵Reports Industrial Commission, Vols. I, XIII.

VIII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

lowering of prices.¹ On the other hand, it is held with equal positiveness that trusts are injurious to the best interests of the country, and that higher prices are the inevitable result of their formation.²

Other witnesses are of the opinion that it is beyond the power of industrial combinations to exercise absolute control over prices, and that the matter will regulate itself.³ The opinion is expressed that the majority of merchants and manufacturers are controlled by the belief that reasonable prices, fair dealing, and fair profits are the best basis for continued prosperity.⁴ One witness, while expressing his belief that the tendency of industrial combinations is to lower prices, says that the making of lower prices is a matter of less importance than the making of uniform prices, and states that one of the greatest benefits to be derived from the formation of industrial combinations is to be found in the fact that all buyers are put on an equality and that prices are stable.⁵

It is believed by one witness that our foreign trade will be extended by means of industrial combinations, and the statement is made that people abroad are already attributing the growth of our foreign trade to the formation of vast combinations in this country.⁶

Political effects.—The greatest evil growing out of the formation of industrial combinations is believed by one witness to be the corrupting influence of such combinations on the politics of the country, and the assertion is made that trusts exercise an unwarrantable influence over political affairs, municipal, State, and National; that they have unwarrantably interfered with the free exercise of the suffrage by workmen and have improperly influenced the action of legislative, executive, and judicial bodies.⁷

Tendency to socialism.—The belief is expressed by two witnesses that the formation of industrial combinations is likely to lead to socialism. This result would be welcomed by one of the witnesses on the ground that competition has been a curse to the working classes,⁸ while the other witness would consider such a result a great evil, in that it would destroy the ambition, initiative, and individuality which have made this country.⁹

Effect on labor.—The difference of opinion in respect to the effect on labor of the formation of industrial combinations is quite as great as is that in regard to the effect on prices and on other industrial conditions. It is believed by some witnesses that the large combinations usually pay higher wages and give steadier work than do the smaller concerns;¹⁰ that while some employees may be thrown out of work temporarily, yet they will find other positions, and that in the long run the formation of industrial combinations will be found to be advantageous to labor. It is stated that there was a greater demand for labor after the formation of the iron, steel, and tin combinations than was the case before the consolidations were effected.¹¹ Other witnesses take exactly opposite views, and it is stated that the effect of the formation of industrial combinations is to diminish employment and throw thousands of persons out of work.¹² One witness contends that if more men are employed and at better wages than formerly it is due to the fact that there is an improvement in general

industrial conditions and not to the formation of industrial combinations.¹ One labor leader sees a possibility of the accruing of benefits to labor through industrial combinations, but believes that in order to secure such possible benefits labor must be organized. He states that in cases where the workmen have been strongly organized the trusts have usually met them fairly, and that some concessions have been secured which would not have been obtained if the trusts had not been formed.² Mr. Gompers thinks that there are not yet sufficient facts available to justify a judgment in respect to the effects on labor of the formation of industrial combinations.³ One labor leader expresses a preference for dealing with large combinations and says that it has been found possible to reach agreements concerning wages more readily when dealing with large combinations and to obtain terms which were more satisfactory to the men.⁴ In contradistinction to this statement, the assertion is made by another witness that corporations are, as a rule, more unwilling to recognize labor unions or to deal with committees representing the men than are other employers.⁵

Regulation.—Various suggestions are made by witnesses for the regulation of industrial combinations, one or two advocating national control, and one favoring a constitutional amendment empowering Congress to act if there is any doubt about its present power;⁶ while another would have the Federal and State governments act in conjunction with each other in the enactment of legislation.⁷ Other suggestions are that concerns be prohibited from refusing to sell their products to dealers who handle similar goods manufactured by other concerns;⁸ that prices be regulated so that they shall be uniform throughout the country and shall not be extortionate;⁹ that capitalization be restricted, and that publicity be given to the affairs and accounts of great corporations.¹⁰ One witness distrusts legislative attempts to deal with combinations, and looks to the increase of education and organization on the part of the working people for the remedy of the evils which he believes exist.¹¹ Another witness thinks that the only way to prevent the further growth of combinations is to deprive them of tariff protection.¹²

FOREIGN TRADE.

Growth.—The great increase in recent years in the volume of our foreign trade is referred to by witnesses, the importance of such increase as a relief to the home market is commented on, and the desirability of further development is emphasized.¹³ Chief among the difficulties which lie in the way of further development is believed to be the failure on the part of American manufacturers to recognize the value of the foreign markets and their lack of such understanding of conditions as will enable them to enter those markets most effectively.¹⁴ Another difficulty in the way of the extension of foreign trade is the necessity for giving long credits.¹⁵ Defective shipping and banking facilities also tend to hamper export trade.¹⁶ One witness believes that our present tariff policy interferes with trade development.¹⁷

X. INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

Methods of developing foreign trade.—The necessity of consideration of and adaptation to the tastes and prejudices of the people of other countries in order to build up foreign trade is pointed out and dwelt upon by witnesses,¹ and the importance of supplying reliable goods of high quality is touched upon.² In the cases of certain countries where there are special superstitions the adoption of special trade marks is found to be an aid in the development of trade.³

Philadelphia Commercial Museum.—The work of the Philadelphia Commercial Museum and the effect of its work on the development of foreign trade is set forth at some length. It is the object of the museum to supply American manufacturers with such specific, detailed, and accurate information as will enable them to build up an extensive trade with other countries, and to bring foreign buyers and American sellers into touch with each other. To this end the museum has gathered together an extensive collection of raw products, having a commercial value, from nearly every country in the world. It keeps in touch with trade conditions in foreign countries, receives numerous publications from foreign governments, and is able to supply information in regard to foreign firms and the commercial laws of different foreign countries. Exhibitions are held by the museum in different cities throughout the country for the purpose of disseminating information and of acquainting merchants and manufacturers with the resources and work of the museum. Many merchants, both in this country and in foreign countries, have availed themselves of the services of the museum, and the work done by the museum is stated to have been an important factor in the extension of foreign trade.⁴

Consular service.—It is the opinion of witnesses that the upbuilding of our foreign trade could be materially assisted by intelligent effort on the part of American consuls.⁵ That our present consular service is not up to the grade of merit which ought to characterize it is the judgment of those witnesses expressing an opinion on this subject,⁶ one witness going so far as to say, "It is the exception to meet a consul that understands anything about the nature or the duties of his office."⁷ Special training for the consular service, long tenure of office, and advancement on a basis of merit only are advocated as means whereby the character of the service may be improved.⁸

Export prices.—It is stated by witnesses to be the general custom in all countries for lower prices to be made on goods sold for export than on goods sold for home consumption;⁹ and this custom is said to prevail regardless of the tariff policy of the different countries.¹⁰ The reason given for the custom is that it is found to be profitable to manufacture more goods than are necessary for home consumption in order to keep mills running to their full capacity and to dispose of the surplus over the amount necessary for home consumption at the best price possible under conditions existing in foreign markets.¹¹ In spite of the existence of this general custom, however, the majority of the manufacturers testifying on this point are not in the habit of making prices for export lower than domestic prices.¹² Others report that they make a lower price on goods sold abroad in order to compete with local products than the price for which they can afford to sell the goods in this country.¹³

THE TARIFF.

Witnesses are almost unanimous in expressing opposition to any changes in our present tariff policy or in existing tariff schedules.¹ Not one advocates a general tariff revision, and although a number of witnesses point out specific inequalities or would be glad to have specific changes made in certain designated schedules, only one expressing an opinion on the subject is willing, for the sake of having such changes made, to have the matter of tariff revision taken up.² There would have to be a very "serious and troublesome state of affairs," in the opinion of one witness, to justify the undertaking of a general tariff revision.³ One manufacturer, although announcing himself to be a free trader by conviction, declares that the adoption of free trade in this country would unsettle everything and wants the tariff left untouched.⁴ One witness speaks in favor of the extension of the policy of reciprocity.⁵ The business depression of 1893 and following years is attributed by several witnesses to tariff changes,⁶ and the development of a number of specific industries is attributed by other witnesses directly to tariff protection.⁷ The testimony presented along this line, together with the effects of the tariff generally on these industries, will be referred to more in detail in speaking specifically of the industries affected.

It is the opinion of the two witnesses who touched upon the subject that the removal of the tariff from trust products would injure the domestic competitors of the trust more than it would injure the trusts themselves.⁸ One witness speaks in favor of the creation of a permanent tariff commission, and believes that if the members of the commission were selected because of special fitness and without regard to their party affiliations, the appointment of such a commission would result in a better adjustment of tariff schedules than is otherwise possible.⁹

COMMERCIAL EXCHANGES.

The history and value of commercial exchanges are discussed by one witness, and the statement is made that these institutions are as indispensable to our present material development as are the railroad and the telegraph, and that they practically regulate the commercial and financial transactions of the civilized world. Their objects are to establish, protect, and build up the market in the particular line of trade which they concern, and thus increase the commercial importance of the cities in which they are established; to provide just and equitable rules for the transaction of business, and to insure the operation of commercial machinery with the least possible friction. Attacks upon the exchanges on the ground that they are monopolies are held not to be well based, the courts having decided that there is lacking every ingredient of monopoly. The rules of the exchanges are said to constitute a codification of the usages and customs which have been established in particular markets, and are designed to secure a free and open market where dealing shall be matter of record and of public knowledge.¹⁰

¹⁰ Vol. VII: McCoy, 991-999.

XII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

PATENTS.

One witness speaks of the ease with which it is possible to obtain patents for alleged inventions, which are in fact not inventions, and of the trouble to which this leads and the annoyance and expense which it causes. The suggestion is made that greater care be exercised in the issuing of patents so as to avoid the granting of patents to persons not entitled to them.¹ The expense of patent litigation and the delay in obtaining a decision are referred to by another witness, and a desire for some legislative remedy is expressed.²

DEPARTMENT STORES.

History.—The department store in this country dates from the early seventies, when changed industrial conditions led to changes in business methods. The fall in prices after the civil war and the close figuring necessary in order to secure a margin of profit are given as reasons for the springing up of department stores.³

Effects generally—Advantages and disadvantages.—The opinions of the representatives of department stores and the opinions of small dealers as to the effects of department stores on the interests of consumers, and the part which they play in industrial life differ widely. The department store representatives are unanimous in saying that the department store is an advantage to the consumer. Its existence, it is held, is due to the irresistible tendency on the part of the producer to meet the consumer as directly as possible, and to the tendency of merchandise to find distribution along the lines of least resistance. It is stated that by the consolidation of retail business in great stores the risk of loss and the cost of selling are both reduced and economies made possible;⁴ that fewer clerks are required for the same amount of business; that there is saving in rent, in the cost of superintendence, and in the expense of book-keeping.⁵ The department store, by buying in large quantities, can buy at lower prices than can the small dealer, it is claimed,⁶ and, furthermore, by buying directly from the manufacturer the expense of commissions, as well as that of reshipment of goods, is avoided. In addition to these advantages, the department store, by being able to pay cash, often gets a considerable discount which is not available to the small dealer. The rapidity with which stocks of goods are disposed of brings the manufacturer and the consumer into closer touch with each other, and, as a result, goods are manufactured more closely in conformity with demand and more nearly to the time of distribution.⁷ As a result of the economies made possible by the consolidation of retail business, customers, it is said, are better served and prices are lower. The reduction in retail prices in recent years is referred to in confirmation of this statement, and the further statement is made that the margin of profit to the retailer has been reduced one-half during the last twenty years. In the opinion of one witness, the right of the department store to exist must be measured by the extent of its benefits to the community, and its success will depend on its ability to effect economies and on the character of the service which it renders to society.⁸ The greater convenience to customers, especially to those coming from a distance, in finding everything called for under one roof, is referred to as another advantage accruing to the public from the existence of the department stores.⁹

¹ Vol. XIV: Gibson, 286-289.

² Vol. XIV: Howe, 499.

³ Vol. VII: Woodward, 733, 734, 736.

⁴ Vol. VII: Wanamaker, 451, 452.

⁵ Vol. VII: Chalfoux, 339-343; Young, 696, 697.

⁶ Vol. VII: Woodward, 735, 736.

⁷ Vol. VII: Chalfoux, 339, 343; Wanamaker, 455, 456, 460.

⁸ Vol. VII: Wanamaker, 451, 452.

⁹ Vol. VII: Wanamaker, 455, 456, 460.

These statements are not indorsed by the small dealers, one of whom asserts that the expenses of the department stores are greater, comparatively, than are the expenses of the small dealers, and who states that he has found that it costs a retail grocer about 12 to 12½ per cent to do business, while it costs the department store about 18 to 18½ per cent to do business in that line.¹ It is said also that the small dealers sell as cheaply as do the department stores,² though it is admitted that, in some cases, customers received better value for their money at the large stores.³ One witness bases his opposition to the department store on the ground that it is an instrument for economizing, and that by economizing it restricts the people's opportunities for making a living. According to this witness, the department store economizes on space and thereby causes depression in the value of real estate; it economizes in service, as fewer clerks are required for the same amount of sales; it economizes in salaries by employing children instead of men and women, and it economizes in the purchase of goods by buying goods in large quantities. It is claimed that by buying at low prices it forces the manufacturer to sell at the closest margin of profit and thereby restricts his ability to pay living wages, so that often the lower prices secured are obtained at the expense of the manufacturer's employees.⁴

Methods of business.—One of the greatest objections to department stores, in the opinion of the small dealers, is the fraudulent methods which, it is claimed, are followed by them and the fraudulent advertising of which they are guilty;⁵ and the enactment of national legislation providing for the punishment of fraudulent advertising is advocated.⁶ The department store dealers, while admitting that there are department stores which practice deception upon the public, say that the better class of department stores do not deceive as to the quality of their goods, do not handle bankrupt stocks, and, as a rule, do not cut prices below cost on certain goods in order to attract trade.⁷ The one-price system which has been adopted by department stores is referred to with approval.⁸

Elimination of middlemen.—Department store dealers and small retailers agree that the middleman is being eliminated, and that commission houses and jobbers will soon be things of the past.⁹

Effects on small dealers.—That the department stores are crowding out the small one-line stores is asserted by the small dealers¹⁰ and is not denied by the department-store representatives, though some of the latter think that there will continue to be a sphere of usefulness for the small store because of its local convenience or because of a preference for direct personal service.¹¹ It is declared by one witness, however, that the interests of the small storekeepers are not the primary consideration in judging the department store system, but that the interest of the public is the first consideration; that the public is served by economical distribution of goods, and that the ability of the department store to take trade away from the smaller stores depends entirely upon its giving better service and selling goods at lower prices. It is not just, it is claimed, to the public to establish a store for one exclusive class of goods for which the chief demand occurs during a small part of the year, and to saddle upon the consumer the expense of maintaining the property and the organization of the business during the entire year. Department stores, it is said, have no monopoly characteristics, but that, on the contrary, there is keen rivalry between

XIV INDUSTRIAL COMMISSION: MANUFACTURES AND BUSINESS.

the different stores. The vast variety of merchandise which is carried by each one makes a combination of them practically impossible, according to the opinion of one witness, and it is stated that no tendency toward combination has been manifested. It is contended that there is no injustice to local dealers in the establishment of mail-order departments, as the people in the small towns would not buy from the department stores in the large cities if they could get the goods they wanted at home.¹ The taxation of department stores seems to be favored by certain small dealers.² One of the department store representatives expresses the belief that such taxes would ultimately be borne by the consumers.³

Effect on labor.—It is stated by department store dealers that more labor is employed because of the establishment of department stores. The reduced prices, it is held, stimulate consumption, and therefore increase employment both in the manufacture of goods and in their distribution, and it is stated that more than the total number of competent persons thrown out of employment in small stores by the competition of department stores are given employment in the department stores themselves.⁴ It is said, furthermore, that the department stores afford increased opportunities for the employment of women, while they do not curtail the employment of men.⁵ It is asserted also by the representatives of department stores that wages are universally higher and hours of labor are shorter in the department stores than in the small stores.⁶ On the other hand, it is maintained by small dealers that the department stores have deprived many people of employment, and that men have been replaced by women, who receive only a fractional part of the wages which were paid to the men.⁷

It is claimed by witnesses that the department store does not tend to destroy the individuality of the employees; that an employee may easily hold a more important position in a department store than he would hold if working for himself; that many employees receive larger salaries than they could possibly earn independently, and that the employees in the large store take pride in the establishment.⁸

CONDITIONS OF BUSINESS IN THE SOUTH.

Advantages of the South as a manufacturing section.—The outlook for the development of manufacturing interests in the South is believed to be very bright. Manufacturing enterprises are growing in number and are enjoying constantly increasing prosperity.⁹ The people of the South are alive to their opportunities and are making strenuous efforts to further industrial progress,¹⁰ and it was for the purpose of promoting industrial interests in the South that the Southern Industrial Convention was formed.¹¹ Southern legislatures apparently are ready to offer inducements to manufacturing enterprises by granting exemption from taxation and by enacting other legislation believed to be favorable. Alabama has even gone so far as to abolish the age limitation for children employed in the cotton mills.¹² The need of Northern capital for developing the resources of the South is touched upon by one witness.¹³

There are numerous advantages possessed by the South for manufacturing, especially for manufacturing cotton and iron products. The climate is mild, raw materials and fuel are close at hand, and there is said to be a plentiful supply of labor, both skilled and unskilled.¹⁴ Another advantage, in the opinion of one witness, is that labor organizations exercise little control over industrial conditions.¹⁵ It is

stated, however, that attempts made by certain cotton mills to manufacture the same style of goods as are made in Fall River were not successful because the labor cost was much greater than that of the Fall River mills.¹

The development of cotton manufacturing in particular in the South and its effect upon cotton manufacturing in New England will be referred to more specifically in discussing conditions of business in the cotton trade.

Conditions of transportation.—There seems to be little doubt that the South is at a disadvantage as compared with the North in respect to transportation facilities and freight rates on manufactured goods. One witness testifies that the freight rate on cotton goods from Atlanta to New York is about 80 cents, while from Lowell to New York it is about 15 cents. This witness has shipped goods to California via the Southern Railway and has been obliged to deduct the freight to New York from the price, as the goods were sold deliverable at New York.² It is claimed also that the fisheries of Florida, especially those in the neighborhood of Jacksonville, are greatly hampered by the excessive charges of the Southern Express Company, which is the only express company reaching that region. Shipments to Western cities can be made more cheaply by being sent by the roundabout way of New York than by the direct routes.³

BUILDING AND LOAN ASSOCIATIONS.

The building and loan association had its origin in Philadelphia, and appears to have grown out of the custom of home ownership which had sprung up in that city, and which had been developed under the influence of the system by which a man could purchase land through the payment of ground rent. The first building and loan association was formed in 1837 in Frankford, now a part of the city of Philadelphia. There are at present, in addition to national associations, some 1,200 building and loan associations in Pennsylvania with assets of \$113,000,000, and more than 5,000 such societies in the United States with nearly a million and a half members and with assets amounting in round numbers to \$575,000,000. As the building and loan associations have increased in numbers two distinct kinds of organization have developed: The associations operating under what is known as the Philadelphia plan are of a more or less fraternal character, do not maintain permanent offices, hold only occasional meetings, and have officers who serve either without pay or for nominal salaries. Associations operating under what is known as the Dayton plan are conducted on a purely business basis without any of the fraternal element. At the beginning, the building and loan associations loaned money below the market rate, and their money therefore was at a premium. For a number of years past, however, there have been no premiums paid in the case of the Philadelphia societies. The object of the building and loan association was primarily to enable members to build their own homes. The custom is very general now, however, for members to buy houses already built, and practically the building and loan associations are to-day purely loan associations with mortgage securities, and the members are investors rather than borrowers. It is believed that building and loan associations have had a very conservative influence on industrial life. They have led to home ownership, and have therefore made men more unwilling to engage in strikes except on great provocation. It is said also that the members have received a certain business training from their connection with such associations.⁴

XVI INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

POTTERY TRADES.

History and development.—The pottery industry in this country dates from 1765, when the establishment of a pottery in South Carolina caused uneasiness to English manufacturers. The industry did not become of any commercial importance, however, until a century later, and it was not until after the Centennial Exposition that decorated goods were manufactured to any great extent. To-day American potteries are turning out all lines of clay products, from the coarsest and least expensive goods to pottery of the utmost delicacy and of the highest degree of artistic development.¹ It is the opinion of both manufacturers and workmen that in almost all lines, American goods are fully equal to any produced abroad, and that in the case of some products American wares are superior.² The only respect in which American wares are thought to be not fully equal to the best foreign products is in the finish and decoration of the highest grades of French china,³ though even this is questioned, and the statement is made that American manufacturers are producing at the present time table china which is able to hold its own with the best produced in France.⁴

The manufacture of sanitary ware was first undertaken in 1872. Previous to that time all sanitary ware was imported. Such advance, however, has been made that at the present time practically no sanitary ware of foreign manufacture is sold in this country; American goods are far superior to those produced elsewhere; and American manufacturers are exporting their goods in increasing quantities to all parts of the world. The first solid porcelain bath tubs were made in 1893, and to-day American manufacturers not only supply the American market, but are exporting these goods to European countries.⁵

The manufacture of tiles was begun a little later than that of sanitary ware, and the tile business is the youngest of any of the clay industries. Up to 1880 the American market was controlled by English manufacturers. In that year, however, at an exposition held in England, an American tile manufacturer was awarded the gold medal over the English and Continental manufacturers, and this incident gave an impetus to the tile business in this country. American manufacturers were at first handicapped by the action of English manufacturers in reducing prices. In addition to this, an error in classification allowed the importation of tiles through the port of New York under a duty of only 20 per cent. This error was remedied and a duty of 45 per cent exacted. From that time on the business grew rapidly, and to-day American manufacturers are stated to be supplying 90 per cent of all the tiles sold in the United States and to have built up a fair and increasing export trade. In the opinion of the tile manufacturers American tiles are superior to those of foreign production. Complaint is made, however, that the Government does not use tiles in its public buildings, but uses marble almost exclusively, while England, on the other hand, tiles all of her government buildings. White marble, it is stated, is not as desirable for sanitary purposes as is a fine vitrified tile, because marble is absorbent, while tile is absolutely nonabsorbent.⁶

The growth of the pottery industry is said to have been due in large measure to the natural resources of the country, and to the wise development of those resources. In the opinion of manufacturers the protection afforded by the tariff has been a very important element in the upbuilding of the industry,⁷ while the lack of skilled labor

and of men of artistic education and taste, in addition to the lack of technical schools for the training of such workmen, has served somewhat to retard its growth.¹ A serious handicap under which American manufacturers suffer is the great advantage given to foreign manufacturers in the matter of freight rates. When the rate from Liverpool, England, to St. Louis was 27 cents a hundred the rate from Trenton to St. Louis was 41 cents a hundred.² Goods can be sent from Liverpool to San Antonio, Tex., for 40 cents a hundred, while the rate from Trenton to San Antonio is 98 cents a hundred;³ and goods are landed at Philadelphia from Liverpool, England, at only 5 cents a hundred more for freight than similar goods can be landed in Philadelphia from Trenton, which is only 30 miles away. In one instance English manufacturers were landing their goods at San Francisco for \$2.50 a ton, while the rate from Trenton to San Francisco was \$27 a ton. It is stated that the tariff is not sufficient to overcome the difference in freights, and that therefore the western trade of eastern potteries is not of much consequence.⁴ Domestic freight rates on tiles are also complained of, the rate from Trenton, N. J., to Sydney, Australia, being 50 cents a hundred, while the rate from the same point to Omaha is 57 cents and to Galveston 43 cents a hundred.⁵ One of the greatest obstacles, however, to the development of the industry has been the prejudice on the part of the American people against goods of American manufacture. This prejudice is being overcome,⁶ but it has not entirely died out, and because of its existence some American manufacturers stamp their goods as foreign made and sell them as imported products.⁷ The fact that American manufacturers are obliged at present to import certain clays is mentioned by one witness as an additional disadvantage under which American pottery manufacturers labor, and the suggestion is made that the Government appoint men to make investigations for the purpose of discovering, if possible, clays in this country which may be substituted for foreign clays.⁸

Dependence on the tariff.—In the opinion of one manufacturer the development of the pottery industry was delayed in the past by the lack of adequate Government protection. Wages in the pottery industry, he says, are much higher in this country than in Europe, and the rate of duty imposed upon foreign goods has never been commensurate with the difference in wages.⁹ Even in the present tariff law, it is alleged, there are certain defects, in that under the ad valorem duty undervaluation is possible and is frequently resorted to.¹⁰ More rigid examination of imported goods and severer penalties for undervaluation are advocated.¹¹ Manufacturers and workmen unite in saying that the pottery industry could not exist under present conditions without the protective tariff, and that if the tariff were reduced the industry could be continued only by the reduction of wages.¹² This, however, does not apply to the manufacture of sanitary wares.¹³ The Wilson tariff law, according to several of these witnesses, had the effect of paralyzing the pottery industry.¹⁴ The industry has recovered, however, from the depression which characterized it in 1893 and in immediately succeeding years, and is now in a flourishing condition.¹⁵

GLASS TRADES.

Flint glass—*The National Glass Company*.—There are four main branches of glass manufacture: Flint glass, including prescription glass, pressed ware, table ware, etc.; window glass; plate glass; and green glass.¹ There are two combinations of flint-glass manufacturers: The National Glass Company, which is a consolidation of 19 concerns, and the United States Glass Company, which is a consolidation of some 11 plants.² The plants controlled by the National Glass Company represent about 75 per cent of the capacity of the flintglass plants of the country. This company is incorporated under the laws of Pennsylvania and has a capital of \$4,000,000. It became the actual purchaser of the concerns entering it, paying for the plants purchased either in cash or securities. Most of the previous owners, however, took payment in securities. The individual plants were taken over at a valuation made under oath by a committee of competent men, and capitalization, it is stated, was based on actual appraised value. The excessive and ruinous competition which, it is said, existed in the glass trade led to the formation of the combination. According to the testimony of the president of the company, the discovery of natural gas led to the establishment of a great number of glass works, and the works which had natural gas did not take account of fuel cost in their expenses, while the cost of fuel was one of the chief items of expense to other concerns. In many cases, also, it is claimed, no account was taken of the wear and tear of machinery. As a result of these methods of figuring, it is stated, prices were in most cases reduced below the actual cost of production, and many of the concerns were not making any profit, while many others were actually losing money. The combination was formed both for the purpose of raising prices to a profit paying point and for the purpose of effecting economies. It was hoped that by the formation of the combination a large number of traveling men could be dispensed with. This, however, has not been found practicable, and the number of traveling men, as well as the number of office employees, has been increased rather than decreased since the company was formed. The principal reduction in selling expenses has been made through dispensing with the services of local agents.

In addition to the benefits derived from having been able to effect this economy through combination, an additional advantage has been secured in that the best skill and knowledge possessed by any persons connected with any one of the establishments can be made use of in the management of all the other plants. Prices have been somewhat raised since the formation of the combination. This, however, it is held, has been necessary because of the fact that previous to the combination prices had been such that the business was unprofitable. It is declared that, although the company controls 75 per cent of the flint-glass plants of the country, and is therefore able to exercise a powerful influence on prices, it nevertheless is not able arbitrarily to fix high prices, and that if it should attempt to do this a reduction in demand would follow. Whether or not there is any agreement as to prices between the company and the outside concerns the secretary of the company refused to state. Prices are, however, it is admitted, essentially uniform. The company has a considerable export trade. The prices on export goods average quite a little lower than the prices on similar goods for domestic consumption, but it is claimed that it is necessary to make lower prices in order to compete in foreign markets with the Belgium manufacturers. The fixed charges of manufacturing, it is stated, are the same whether the product is greater or less. Foreign sales permit an increase of output and thus enable the fixed charges to be distributed over a larger amount of production. Because of this the manufacturer can afford to sell his surplus product abroad at lower prices than

¹ Vol. XIV: Thompson, 828.² Vol. XIV: Fry, 808.

those placed upon the goods sold in the domestic market.¹ It is asserted that the flint-glass industry could not have reached its present development if the protective tariff had not secured to it the home market.² Some flint glass goods are still imported; in general, the goods that are imported being those for the production of which a great deal of labor is required and not much use of machinery made.³

Window glass.—The American Window Glass Company claims to control about 1,700 pots, while the plants outside the combination are said to have probably about 1,000 or 1,100 pots. It is stated that the combination has not been able to operate its full number of pots because of the lack of competent workmen, and that sometimes from 25 to 30 per cent of the pots have been idle. It is estimated that 75 per cent, possibly more, of the cost of window glass is labor cost, and it is stated that the industry could not exist without the protection of the tariff.⁴

Prosperity of the trade.—One witness states that the profits in glass manufacture are greater now than they were twenty years ago, in spite of the fall of prices. Improved methods of manufacture have enabled workmen to double their output, and plants have increased greatly in size and have an enormous productive capacity.⁵

RATTAN TRADE.

A manufacturer of rattan goods complains that the tariff on these goods is not sufficiently protective; also that the rattan industry is handicapped by high freight rates, both domestic and export. It is stated that the rates on rattan goods coming from Europe to the United States are very much lower than are the rates on similar goods going from this country abroad.⁶ This latter statement is, however, contradicted by other witnesses, and the statement is made also that a higher tariff rate on rattan goods is not called for.⁷

COTTON TRADE.

Development of cotton manufacture.—There has been considerable advancement made in recent years in the development of artistic features in the manufacture of cotton goods, the first impetus to artistic development having been given by the Centennial Exposition. According to one witness there was high development along this line in the early nineties, but advancement was checked by the business depression which prevailed from 1894 to 1897, the demand during those years being chiefly for cheap goods.⁸ The improvement made in the printing of cottons is especially referred to by one witness. Thirty years ago the machinery in the mills of this witness was adapted to producing patterns of one color only, while to-day more than half of the machinery in these mills will produce from 8 to 14 colors with one revolution of the rollers over the cylinders. There has been great improvement also in the quality of the dyes, aniline and aniline dyes having superseded logwood. These dyes are found to work equally well in the machines and to make more satisfactory goods, and to-day American printed cottons are equal it is stated, so far as having fast colors is concerned, to any goods which are produced anywhere. About 50 per cent of the materials used in the dyes are produced in this country and about 50 per cent are imported. Many of the designs used are staple designs which go on from

XX INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

year to year, but a large percentage of the finest patterns are changed yearly. The usual custom is to make original patterns, following suggestions obtained from foreign prints. The gray cottons manufactured in New England are found to be as satisfactory for printing as any which are produced in the world. It is stated that the protective tariff has developed very active competition in the manufacture of printed cottons and that all grades of printed fabrics, from the lowest quality to the finest goods, are now produced in this country. As a result of competition improvements have been made in machinery, output has been increased, the quality of goods has been improved, and prices have been reduced so that goods are being sold now for one-third of what was charged for them 30 years ago. About 30 per cent of the labor employed in the production of these goods is skilled labor.¹

In general, American cottons are said to be fully equal, if not superior, to those of foreign manufacture. They are said to be made of better material, to be absolutely free from filling, and to be superior in wearing quality to English cottons.² In the opinion of one witness, American goods are equal in texture, style, and finish to any that are produced in Europe, and the exhibit of American cottons at the Paris Exposition is stated to have been equal to that of any country.³

A comparatively recent development in cotton manufacture is the manufacture of lace curtains, this industry having been established within the past 6 or 8 years, and having been especially developed in the last 5 years. Nottingham lace exclusively, it is stated, is manufactured, and the goods produced are equal, grade for grade, to those produced in England. The manufacture of lace curtains is centered in Philadelphia, and that city also has a leading position in the manufacture of Turkish towels and similar pile fabrics.⁴

Cotton manufacturing in New England.—The finer grades of cotton goods are manufactured in New Bedford, manufacture being confined to spinning and weaving, no finishing being done.⁵ In Fall River the leading cotton product is what is known as print cloths, though a considerable variety of cotton goods are manufactured.⁶ New Bedford is said to have a certain advantage for cotton manufacture in the humidity of its atmosphere,⁷ while the advantage of Fall River is found in its nearness to markets and in its water communication.⁸

Cotton manufacturing in the South.—More cotton machinery is at the present time being sold in the South than in the North, and cotton manufacture seems to be increasing more rapidly in that section.⁹ In addition to the natural advantages possessed in the South in respect to climate and in nearness to raw materials and to fuel, it possesses a further advantage in respect to labor conditions, and the rapid development of cotton manufacture, in the opinion of some witnesses, is due largely to this fact.¹⁰

According to one witness wages are 30 per cent lower in the South than in the North, and a week's work in Georgia is 8 hours longer than in Massachusetts.¹¹ The South possesses a further advantage also, in the opinion of several witnesses, in the equipment of its mills, the mills being said to be fitted out with the newest and most improved machinery.¹² One witness, however, thinks that the Southern mills are not generally so well equipped as are the Northern mills. It is thought also by this witness that the natural advantages which the South possesses are offset by the advantage which New England mills possess in being able to secure money at low rates of interest.¹³ Referring to the fact that the Southern mills have to pay higher freight rates on manufactured goods than do the Northern mills, one witness says

¹⁰ Vol. XIV: Lovering, 529, 530.

¹¹ Vol. VII: Thompson, 771. Vol. XIV: Draper, 465, 466.

¹² Vol. VII: Bullock, 522, 523.

that this disadvantage is offset by the lower freight rates on raw materials,¹ while another witness thinks that the disadvantage is not so neutralised.² As yet the Southern mills have confined themselves largely to the manufacture of the coarser fabrics. It is stated, however, that each new Southern mill makes a finer grade of goods than its predecessor.³ The competition of the South, it is claimed, has put a stop to the manufacture of many lines of low and medium grade cotton goods in the vicinity of Philadelphia, goods of a higher grade now being manufactured in that city.⁴

Import trade.—Over \$40,000,000 worth of cotton goods were imported into the country in 1900, the foreign cottons it is stated being chiefly those of finer grade, in which the labor cost is high.⁵ The competition from China and Japan does not amount to much as yet. It may, however, in the opinion of one witness, become serious if China and Japan continue to manufacture cotton goods, as the labor cost in those goods is so much lower than in the United States.⁶ In the production of small quantities of specialties to satisfy a small market, European manufacturers are said to be ahead of us, it being the tendency of American manufacturers, according to one witness, to produce large quantities of a common style and to produce at a correspondingly less cost per unit.⁷ The use of Egyptian cotton is referred to by witnesses,⁸ and it is stated that the staple of Egyptian cotton is more than 1½ inches long, while the Mississippi valley cotton averages but 1¼ inches, and Georgia cotton is usually only from three-fourths to seven-eighths of an inch long. In the opinion of one witness, if there were a tariff protecting long staple cotton it could be produced to a large extent in the South.⁹

Export trade.—There is a considerable export trade in cotton manufactures,¹⁰ the exports for 1900 having amounted to considerably more than \$20,000,000. The principal markets for these goods are China (though trade has been interfered with somewhat by the recent troubles in that country),¹¹ South America, and Africa. Printed cottons, however, are sold in Great Britain, Australia, Canada, and to some extent in Continental Europe, these goods being sold at the same prices abroad as those at which similar goods are sold in this country.¹² There does not appear to be any export trade in crude print cottons.¹³

England is the chief competitor met with in foreign markets.¹⁴ Although the Chinese are manufacturing cotton goods to some extent, it is stated that their goods have never interfered with the sale of well-made American goods, the Chinese goods having been sold in parts of China where the people were willing to use an inferior article.¹⁵ Some of the Southern mills send their entire product to China, and it is the opinion of one witness that only a small proportion of the product of Southern cotton mills is consumed in this country.¹⁶ One Southern manufacturer, however, believes that nine-tenths of the product of his mill, which was sold through New York commission houses, was consumed in this country.¹⁷

Sales methods.—The bulk of the unfinished print cloths manufactured in Fall River are usually sold through brokers to the converters in the various parts of the country, while cloths in the finished state for domestic consumption are, as a rule, sold through commission houses.¹⁸ The bulk of the cottons manufactured in New Bedford, however, it is stated, are sold direct to purchasers.¹⁹ Goods for export are sold to local houses in New York which do business in foreign markets.²⁰

XXII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

Combination.—A year or two ago, it is stated, an attempt was made to form a consolidation of the mills engaged in the manufacture of print cloths in Fall River, but the attempt failed.¹ The mills making cotton yarns, however, have united to form the New England Cotton Yarn Company. Since the consolidation of these mills an effort has been made to run the separate mills each on a class of work by itself, and in this way economy in production has been effected. The cost of administration has been reduced also and the new company has experienced an additional advantage from the fact that it is able to buy supplies to better advantage than they could be bought by the individual mills. Since the formation of the combination wages have been increased 10 per cent and the mills have been run on fuller time. It is estimated that the earnings of the workers have averaged 15 per cent more since the consolidation of the mills than formerly. There has been an increase in the prices of products since the formation of the combination, but it is claimed that this is due to the rise in the price of cotton and not to the consolidation of interests. A change in sales methods has been inaugurated by the combination. Whereas the individual concerns marketed their products for the most part through commission houses, the combination sells its entire output directly to the customers through its own salesmen.²

The tariff.—Because of the fact that the labor cost in the production of finer fabrics is very much greater than the labor cost in the production of coarse and heavy fabrics a higher rate of duty is imposed on the finer grades of cotton than on the coarser goods, and the statement is made that, so far as the fine grades of cotton goods are concerned, the cotton industry is dependent on the tariff. While the tariff on coarse fabrics is held not to be so necessary as the tariff on fine cottons, yet a moderate duty is advocated as a precautionary measure.³ It is feared that if the tariff on the coarse goods were removed, European manufacturers would ship their surplus goods to this country whenever they had an overproduction, and would sell them at prices which would be ruinous to the American manufacturers.⁴ In the opinion of several witnesses, if the tariff on cottons should be repealed or reduced, depression in the cotton industry would immediately result, and manufacturers would be obliged to reduce wages in order to meet foreign competition.⁵ One witness, however, thinks that the cotton manufacturers can get along without any tariff on cottons, inasmuch as they can now beat England in many markets. This witness does not fear that in case of the removal of the tariff foreign manufacturers would dump their surplus stocks in this country. He admits that the reduction of the tariff would cause a reduction of wages, but claims that labor could buy more for the same amount of money than it is able to buy now.⁶ The active competition which it is stated has been developed in the manufacture of printed cottons as a result of the protective tariff has forced manufacturers to look for foreign markets. The fact that the home market is reserved to them has led them to turn out a very large product, and this has resulted in lowering the cost of production and has put the manufacturers in shape to compete in foreign markets. So long as the home market is secured to them, they claim they can turn their attention to extending their foreign trade; but if consumption in this country should be so reduced as to cause a reduction in output, the cost of production would go up, and they would be at a disadvantage in seeking foreign markets. The removal of the tariff on these goods, it is claimed, would not result in any lowering of prices to American consumers, as the English manufacturer would have such an increase of business that he would raise his prices in this country immediately. Printed cottons are now sold at as low prices in this country, it is stated, as goods of the same character are sold in foreign markets, and the American goods are of superior durability, workmanship, and style. It is only exclusive styles which are

⁶ Vol. XIV: Lovering, 533, 534.

imported. Formerly, when duties were lower, the gray cottons used for printing purposes were imported, but at the present time gray cottons of home production are largely used.¹

Earnings of cotton mills.—Several witnesses testify that the earnings of the New England cotton mills are not excessive. It is stated that many of the mills are undercapitalized, and that although the dividends are in many cases large if computed on the nominal capital, they are only moderate if computed on the actual capital invested.² Several witnesses testify that the dividends paid by their mills have ordinarily been 6 per cent.³ One witness, however, declares that although as a general thing the mills pay a dividend of about 6 per cent, in some cases special dividends are declared, and that one mill inside of 10 years declared dividends of over 100 per cent. He says, however, that it is fair to state that the owners in this case claimed that the capital stock did not nearly represent the actual value of the mill. According to this witness, when cotton mills are well managed they always make money.⁴

The profits of Southern cotton mills appear so far to have been phenomenally large, one witness testifying that to his knowledge the Dalton mills in 1898 paid a dividend of 45 per cent, and that he is informed by the newspapers that in 1899 they paid a dividend of 93 per cent,⁵ while another witness refers to a mill which made a profit of 62 per cent in 1899.⁶

Present trade conditions.—While the cotton industry has been in a much more prosperous condition during the last 3 years than in the 3 years previous,⁷ conditions existing at the time the testimony of witnesses was taken (February, 1901) were far from satisfactory.⁸ The existing depression in the industry was attributed by some witnesses to the high price of cotton, the high price of cotton being said to be due to increased demand,⁹ by other witnesses it was attributed to the fact that the output of goods was ahead of the market.¹⁰ One witness contended, however, that there was money in cotton manufacturing with the prices of cotton and cloth which ruled at the time of his testimony.¹¹

Cotton machinery.—Very great improvements in cotton machinery have been made in the last 30 years. The improvements made in spindles alone since 1870 have made it possible to double the production of cotton yarn with the same machinery, the same labor, and substantially the same power. In fact, the spindle of the present day is capable of unlimited speed, and the speed of the spindle is now limited only by what the other parts of the machinery will stand. Equally great improvements have been made in looms, and the Northrup loom, but recently put on the market, is said to contain such improvements that a weaver can run from 16 to 20 looms, whereas with the best looms made previous to the introduction of these latest improvements he could run only from 6 to 8 looms; and it is said, furthermore, that he can produce as much cloth per loom, and cloth of as good quality, as he could produce running the smaller number of looms of the old pattern. It is stated, moreover, that it is easier for a weaver to run 16 Northrup looms than to run 8 of the other kind. In Italy a weaver runs only from 1 to 2 looms and in England only from 2 to 4. The Northrup looms are naturally in great demand, and the manufacturers have turned out 2,000 per month during the last year. Foreign manufacturers, as well as those in this country, can procure looms of this pattern, and, in

XXIV INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

fact, the shops in France, Switzerland, and Austria are beginning to build these looms. Some 800 or 1,000 looms of this type have also been shipped to Japan. As a rule American cotton machinery is not exported, as, because of the high wages paid to labor in this country, the cost of production is much greater than in other countries. Substantially 40 per cent of the cost of the machinery, so it is said, is represented by the amount paid to the labor actually engaged in the manufacture of the machinery, without taking into account any other labor cost.¹

There are a large number of concerns in this country manufacturing cotton machinery. In respect to some of the machinery manufactured, these concerns are competitive; in other cases patents give protection from competition. An effort was made a year or two ago, it is said, to form a combination of the manufacturers of cotton machinery, but the effort failed. One reason for the failure is believed to have been that the individual manufacturers, who take a certain amount of pride in their establishments, feared lest their shops might be closed if a combination were effected. Another reason given is that there was a general fear on the part of the manufacturers that the business, being one which requires a great deal of detailed knowledge in its management, would not be so well conducted if interests were combined.² It is claimed, however, by one witness testifying that manufacturers of cotton machinery have an understanding with each other to maintain uniform prices.³ The prices of cotton machinery are somewhat higher now than in recent years, but this is attributed to the fact that there has been more demand for it and to the additional fact that the cost of raw materials is greater.⁴

More or less English cotton machinery is imported, though it is stated that American machines are in every way as good as English machines, and, as a rule, better, and that American manufacturers would prefer American built machinery to English machinery if they could get it for the same price. The great improvements made in cotton machinery during the last 25 years have been all made in this country.⁵ The use of American machinery seems to be constantly growing, however,⁶ and one witness states that, although his mills are equipped with English machinery, because at the time of their establishment English machinery was considered better than American machinery, yet, if the mills were to be equipped to-day, probably American machinery would be purchased.⁷

One manufacturer of cotton goods advocates the removal of the tariff on cotton machinery, in the belief that the manufacturers of cotton are handicapped by the high cost of machinery.⁸ Other manufacturers, however, take the position that the reduction or removal of the tariff on cotton machinery is not called for. The fact that American machinery costs more than English machinery is attributed to the fact that wages are higher in this country than in England, and the belief is expressed that the removal of the tariff would be disastrous to the manufacturers of cotton machinery in this country, whereas it is doubtful if the manufacturers of cotton would be better off in the end.⁹

WOOLEN TRADE.

Production and consumption of wool.—The yearly per capita consumption of wool in the United States is shown to have fallen from 9.07 pounds in 1890 to 6.7 pounds in 1900. This, however, as is pointed out by one witness, appears to be in line with what has occurred elsewhere and is not a condition of affairs peculiar to the United States.¹ The yearly consumption of wool in this country is in the neighborhood of 500,000,000 pounds, an amount considerably in excess of home production. It would require about 60,000,000 sheep to produce this amount, while at the present time there are only about 40,000,000 sheep in the country. Since the enactment of the

⁶ Vol. XIV: Knowles, 548.

⁷ Vol. XIV: Crapo, 537; Knowles, 548; Davis, 563, 564.

⁸ Vol. XIV: Justice, 370-372.

present tariff law, however, the flocks have been rapidly increasing.¹ In some respects American woolens are thought to be superior to foreign woolens, yet it is stated that, in the blending of certain fabrics for which there is demand, the use of foreign wools is necessary.²

There was a difference of opinion on the part of witnesses who testified in December, 1900, and in February, 1901, as to whether or not the market was at that time wholly free from the wool which had been imported in the last months of the Wilson law in anticipation of the duties of the Dingley law.³ Witnesses agreed, however, that there had been a smaller consumption of domestic wool because of the large importations, and that the stock of wool then on hand was larger on that account than it would otherwise have been.³

American Woolen Company.—A large number of the concerns engaged in the manufacture of woolen goods have consolidated to form the American Woolen Company, with a capital of \$85,000,000. The different plants of the concern manufacture all kinds of woolen goods except ladies' dress goods, the very cheapest shoddy goods, and knit goods. Although the company is a potent factor in the woolen trade, it is stated that it does not possess a monopoly, but that there is lively competition in the industry. Since the formation of the combination there has been a change in sales methods, and now goods are sold directly to jobbers and manufacturing clothiers by the traveling salesmen employed by the company. There has been a considerable increase in the number of employees since the formation of the combination, the reason given for this being that there has been a reduction in the cost of manufacture and an increase in the volume of business. Wages have increased 10 per cent since the formation of the company, and it is stated that the company is to-day paying the highest wages ever paid in this country in woolen manufacturing. The company has realized advantages from buying supplies more economically, from being able to run the different plants better through the comparing of notes by different managers, from effecting savings in freight rates, and from utilizing waste products.⁴

Manufacturing methods.—The methods of business appear to be somewhat different in this country from those followed in England. In England, it seems, each separate process of woolen manufacture—the combing, the spinning, the weaving, the dyeing, and the finishing—is made a separate business, while in this country the processes necessary to convert the wool into the finished cloth are carried on by single establishments.⁵

Quality and prices of woolen goods.—American woolens are held to be fully equal, and in some cases superior, to English goods. One witness says that the worsteds manufactured by the American Woolen Company are superior to Bradford goods; that American kerseys are superior to foreign kerseys; that the clay diagonals made in this country are more honest than the foreign goods and are not surpassed in quality by any foreign makes.⁶ The only foreign-made goods which are admitted to be superior to American goods are the more expensive fabrics, into which more labor is put than is put into the manufacture of any goods in this country.⁶

The prices of woolen goods are said to be considerably higher in this country than in England, the fact being attributed in part to the duty on wool and in part to the higher wages paid in the woolen mills in this country and the greater expense generally of conducting the plants.⁷ Witnesses testify that there has been an increase in the price of woolens in this country since the enactment of the Dingley law, due to the rise in the price of wool.⁸

Export trade.—There is no export trade in woolen manufactures of any account, and the opinion of one manufacturer is that an export trade can be built up only by

XXVI. INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

admitting wool free, or by granting a rebate on exported woolens equal to the duty on all the wools used in their manufacture, while at the same time a protective tariff is maintained on manufactured goods.¹

Depression of business.—Witnesses stated that at the time of testifying the woolen business was in a somewhat depressed condition, one witness attributing this to the sharp decline in the price of wool, which had led manufacturers to restrict purchases to immediate needs.² According to another witness, American mills running full time can make in twelve months as many goods as the American people can consume in fifteen months, and as the mills did run on full time from July, 1899, to July, 1900, the market became overstocked.³

Use of shoddy.—There has been a very large increase in recent years in the use of shoddy. This is attributed by one witness to the fact that under the Wilson law the American market was flooded with foreign woolens, that many American mills were closed, and that those which survived were obliged, in order to sell any goods, to make cloth which contained a large percentage of cotton and shoddy.⁴ Another witness attributes the increased use of shoddy to the fact that there has been a great increase in the volume and variety of woolen goods manufactured, to speculation abroad in wool, and to the popular demand for cheap goods.⁵

Goods in which shoddy is used are said to be in general use, and it is held by one witness that the use of shoddy is, on the whole, a public benefit, because satisfactory goods containing shoddy can be bought for very much less money than goods made of pure wool could be bought. No shoddy is used in the higher grades of woolens; a small percentage is used in medium-priced goods. There would be no occasion for the use of shoddy in fine goods, except perhaps for backing purposes. In some fabrics cotton is worked in so skillfully that it is impossible to detect the fact of its existence with the naked eye. It is claimed that in some cases the use of cotton gives a better finished cloth, and that, considering the price of the cloth, its use is an advantage.⁶

The tariff on wool and on woolens.—One extensive dealer in wool, Mr. Justice, is strongly in favor of the maintenance of a tariff on wool, saying that wool can not be produced in the United States, where sheep have to be housed and fed part of the year, in competition with the Southern Hemisphere, where they graze all the year round.⁷ He states that there were only a dozen or fifteen woolen manufacturers in the United States who wanted the experiment of free wool tried, and that since the trial of it under the Wilson law every one of them, without exception, has confessed that it was a serious and costly error. Most woolen manufacturers, he says, think that the present duties on wool are too high, but, while they would like to have them lower, not one of them is willing to take the risk of tariff changes.⁸ Mr. Justice quotes statistics showing that the wool production of the United States has never decreased except when there has been no tariff on wool, and that under protective tariffs it has increased faster than that of any nation in the world. From these figures it appears that from 1873 to 1884, under the highest wool tariff ever imposed, the wool clip of this country increased 100 per cent, while that of Australasia during the same period increased only 64 per cent, that of the Cape of Good Hope only 60 per cent, that of Argentina only 35 per cent, and that of Great Britain only 19 per cent. It also appears from the figures given that the number of sheep in the United States increased from 40,500,000 in 1880 to 50,500,000 in 1884, while under the lower wool duty imposed by the tariff law of 1883 the number decreased from the figures of 1884 to 41,500,000 in 1888, and that under the higher duty of the McKinley

⁴ Vol. XIV: Justice, 376.

⁵ Vol. XIV: Wood, 517-520.
⁶ Vol. XIV: Justice, 382.
⁷ Vol. XIV: Justice, 382, 397.

law the flocks increased to 47,000,000, only to decrease again under the free wool of the Wilson law to 38,500,000 in 1896. Since the enactment of the Dingley law it appears that the flocks have begun to increase again, and that the number of sheep in the country in 1900 was 40,000,000.¹

Mr. Justice also presents figures to show that, under free wool, wool sold at somewhat lower prices in this country than in England, and that the effect of the removal of the tariff on wool did not, as had been prophesied, have the effect of elevating the London price, and so enabling the American wool grower to get as good a price for his wool as before, but that on the contrary it caused American prices to fall below even what the London price had been. From the figures given it appears also that the London price of wool in 1900 showed that there had been a much greater decline in that market from the prices of 1899 and 1892 than had been the case in this country.² Mr. Justice thinks that it would have been most unfortunate if the treaty of reciprocity with Argentina, by the terms of which the duty on Argentine wool would have been decreased by one-fifth, had been confirmed. Almost all the wool produced in Argentina is similar to our own product, and Mr. Justice holds that if the duty were reduced one-fifth we should soon be importing from that country large amounts of wool similar to that which is raised in this country. In his judgment the argument that, as a result of the confirmation of the treaty of reciprocity, our exports to Argentina, especially our exports of agricultural implements, would be greatly increased is not well based, and he presents a statement showing that in 1897, when we took wool without duty, Argentina bought less than \$500,000 worth of agricultural machinery from this country, while in the 2 years, 1898 and 1899, when there was a duty on wool of 11 cents, our exports of machinery to Argentina amounted to more than \$3,000,000.³

Mr. Wood, president of the American Woolen Company, on the other hand, is an advocate of free wool, claiming that it would be a great advantage to woolen manufacturers, and would not injure the wool grower. According to Mr. Wood there is reason to believe that wool can be raised in the ranch States as cheaply and as advantageously as in Australia, although he admits that in some cases flocks decreased rapidly under the Wilson law. Mr. Wood does not consider wool growing to be an important branch of husbandry in this country, and says that it is chiefly in the hands of a few growers west of the Mississippi, and that more than one-half of the clip of the country is raised on ranches and largely on free Government lands. He believes that wool growing in the far Western States, where land is free, is too profitable to be abandoned, and thinks that the great demand for wool would in itself suffice to encourage wool growing and increase production.⁴

Mr. Wood is, however, a strenuous advocate of the maintenance of the tariff on woolen manufactures, and holds that if the tariff were removed from manufactured goods the country would be inundated with foreign manufactures; that American woolen mills would be obliged to close, and could only resume operations through adjusting wages to meet European conditions. Even if wool were admitted free he would be emphatically opposed to the abolition of the tariff on woollens.⁵ The rebate on exported woollens in the manufacture of which foreign wool has been used, to the extent of the duty on the imported wool, Mr. Wood says, is not of any practical advantage, as both foreign and domestic wools are used in the manufacture of cloth, and the calculation which would be necessary in order to fix the amount of the rebate, would be very complicated.⁶ With free wool and a duty on manufactured woollens, Mr. Wood holds that woolen manufacturers would be enabled to build up an export trade and would therefore be enabled to keep their mills running on fuller time, give their employees more steady work, and produce a greater

XXVIII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

volume of goods at a lower cost.¹ Mr. Wood states elsewhere, however, that the mills are busier at the present time than they were during the free wool period,² but it is his opinion that American manufacturers did not have sufficient time to make a satisfactory experiment with free wool, and that it is probable that if they had been given sufficient time they could have held their own, provided always that protection on manufactured goods had been maintained.³ Other manufacturers testify that during the operation of the Wilson law their business was in a very depressed condition, one witness stating that he was obliged to close his mills for a time,⁴ while another witness says that he ran his mills only up to one-half of their capacity during the period of the Wilson law.⁵

Undervaluations.—The undervaluation of imported woollens is referred to by witnesses,⁶ and one witness is of the belief that undervaluation is a general practice of German manufacturers and exporters when they have to meet an ad valorem tariff. He states that a German manufacturer suggested to him a valuation of 10 per cent below the actual price as the usual custom-house valuation.⁷ The fact that ad valorem duties offer such opportunities for undervaluation is given by one witness as a reason for believing that the increased importations under the Wilson law, as shown by the statistics of the Treasury Department, do not represent the actual increase.⁸

CARPET TRADE.

Development—Present conditions.—There has been such growth in carpet manufacture in this country during the last century that, whereas in 1850 only about 10 per cent of the carpets used in the United States were of American manufacture, at the present time American mills supply some 90 per cent of the home demand. It is estimated that about \$50,000,000 is invested in the industry, that the value of the yearly product is not much under \$75,000,000, and that fully 250,000 running yards of floor covering are turned out daily by the carpet mills of the country. The manufacture of rugs is looked upon as a branch of the carpet industry.⁹ The great development of the industry is attributed to our protective tariff policy.¹⁰

The carpet industry has shared in the general prosperity of the country during recent years, and it is stated that there has never been a time when more carpet and rug looms were in operation or labor more steadily employed than is the case to-day.¹¹ The increased prosperity has been accompanied by a rise in prices of from 10 to 15 per cent, the advance being attributed in part to the paying of higher wages, and in part to the imposition of the duty on carpet wools.¹² The reduction of the duty on carpet wools is favored by one witness, who states that carpet wools are not produced in this country, and that therefore the tariff is not necessary for the protection of any American industry, while it is somewhat of a handicap to the carpet manufacturing trade.¹³

Export trade.—There is some export trade in carpets, the highest point having been reached in 1894, when \$250,000 worth were exported. Three causes are assigned for the fact that exports have fallen off since that time, viz, an increased demand at home which has left little surplus for export, the manufacture of cheap carpets in England and the consequent retention of the English market for that class of goods by home producers, and the provisions of the Dingley law in respect to the tariff on carpet wools. A duty of 4 cents per pound is imposed on carpet wools costing less than 12 cents, and a duty of 7 cents per pound on carpet wools costing more

⁸ Vol. XIV: Justice, 320.

⁹ Vol. XIV: McNeir, 708.

¹⁰ Vol. XIV: Dornan, 310; McNeir, 708.

¹¹ Vol. XIV: McNeir, 708, 710.

¹² Vol. XIV: McNeir, 717.

¹³ Vol. XIV: McNeir, 708, 717, 718.

than 12 cents. In order to take advantage of the 4-cent duty American manufacturers, in buying foreign wools, are obliged to pass by wools sold at a price slightly above 12 cents a pound, when, if it were not for the difference of 3 cents in the duty, it would be considerably to their advantage to buy wools of that grade. It is stated that the rebate of the duty on exported goods does not meet the difficulty because of the cost and trouble involved in tracing the imported wool from the time it enters the factory until the finished product is ready for export, and the loss of interest on the money which is paid in duties when the wools are brought into the country.¹

The prices on exported goods are made somewhat lower than the prices on goods sold for domestic consumption, this being said to be necessary in order to enable American manufacturers to compete in local foreign markets. Only surplus products are sold abroad, and manufacturers hold that it is better to run their mills steadily at full capacity, thereby reducing the cost of production to a minimum, and dispose of the surplus stock at cost, or nearly cost, abroad than to force the surplus production upon the home market and thus demoralize prices. The criticism which might be made to the effect that the protection given the carpet industry has served to increase prices to the American consumer is met by the statement that whereas a yard of Wilton carpet sold at wholesale in 1875 for \$3.25 and a yard of Moquette carpet sold in 1877 for \$2, the price of a yard of Wilton carpet in 1900 was \$1.95 and the price of a yard of Moquette was 85 cents, the conclusion being drawn that home competition has reduced prices and taken care of the interests of the consumer. The growth of foreign trade in carpets, it is claimed, is dependent on the continuance of protection to the industry and the reservation of the home market to the American manufacturers, as it is possible for them to compete with foreign producers only in the sale of their surplus product.²

Oriental rugs.—The lowering of the tariff on Oriental rugs is advocated on the ground that these goods do not come into competition with any goods of American manufacture, and that, therefore, no American industry would be injured by the reduction of the tariff. On the contrary, it is claimed that the importation of Oriental rugs has done much to stimulate a demand for American rugs and to increase the popularity of carpets woven in one piece, and that this fact is recognized by American carpet and rug manufacturers.³

Straw mattings.—The testimony of witnesses goes to show that the large importations of straw mattings from China and Japan have had a serious effect upon the manufacture of ingrain carpets in this country. One witness states that statistics collected some 5 years ago showed that the sale of ingrain carpets had been reduced fully 25 per cent through the increased importation of straw mattings.⁴ From 1890 to 1893 the yearly output of ingrain carpets was more than 50,000,000 yards.⁵ From that time on the output has steadily decreased, until in 1900 it was only about 33,000,000 yards.⁶ Only 8,000,000 yards of matting were imported in 1892, while nearly 40,000,000 yards were imported in 1900.⁶ The cheapness of straw mattings is largely due to low wages paid to the labor employed in their manufacture. The Chinese weaver receives only about 5 cents a day in gold, and the Japanese weaver only about 10 cents a day in gold as wages, while American weavers of ingrain carpets are paid \$2 a day.⁷ The present rates of duty on straw mattings are 3 cents per yard on mattings costing not over 10 cents per yard, and 7 cents per yard and 80 per cent ad valorem on mattings costing more than 10 cents a yard. Ninety-five per cent of the mattings imported are said to cost less than 10 cents a yard, and to pay, therefore, only 3 cents per yard duty.⁸ It is the opinion of witnesses that unless something is done to protect the American manufacture of ingrain carpets there is danger that the industry will be destroyed.⁹ Two remedies for the existing state of affairs are sug-

gested, viz, the increase of the duties on straw mattings to a point such that the manufacture of ingrain carpets will be reasonably protected against their competition,¹ and the adoption of bimetallism by international agreement.²

SILK TRADE.

Development.—The manufacture of silk in the United States was first attempted during the years 1825 to 1830.³ At first, the only business of any account was done in the manufacture of sewing silks and threads.⁴ Experiments in the manufacture of silk textiles were going on all the time, but it was not until after the civil war that the production of woven goods really amounted to anything, and the development of silk weaving may be dated from that time, the growth of the industry being attributed by witnesses to the protection given it by the tariff law then enacted.⁵ In the early seventies the yearly silk production amounted to only about \$5,000,000, while in 1900, according to the census figures, the output of all kinds of silks amounted to \$107,256,258.⁶ The United States is said to rank first among civilized countries in respect to the quantity of silk manufactured and second in respect to the selling value of the manufactured goods, France being first.⁷ American manufacturers supply from two-thirds to three-fourths of the home demand,⁸ and, according to the census figures of 1900, silk mills are to be found in 26 different States and more than 65,000 persons are employed in the mills. There are 44,306 looms in operation, of which only 173 are hand looms; \$81,052,201 is invested in the industry, and the total wages paid out in 1900 amounted to \$20,982,184.⁹

At first, silk manufacture centered in New Jersey, but later the industry began to branch out, and there has been considerable development in other States, especially in Pennsylvania. One witness attributes the growth of the industry in Pennsylvania to the fact that labor troubles were serious and frequent in the New Jersey mills,¹⁰ while another witness seems to think that silk mills were established in Pennsylvania in order that manufacturers might avail themselves of the cheaper labor there, as well as for the purpose of being free from labor troubles.¹¹

Under the old system of manufacturing silk abroad, a so-called manufacturer did not necessarily have any mills or machinery, but perhaps maintained only a warehouse, bought his trams and organzines, sent them to the dyer, afterwards to the weaver, and finally to the finisher. Of late years, however, something approaching our factory system has grown up abroad.¹² In this country all the processes necessary to convert the raw material into the finished product are in many cases carried on under one management,¹³ though frequently, it is stated, manufacturers do not have finishing departments.¹⁴

Piece dyeing and printing branches have increased rapidly in the United States in recent years, so that, according to one witness, American manufacturers dye and print not only domestic silks, but also some imported silks.¹⁵ In some respects American dyers are said to be ahead of foreign dyers, especially in respect to the rapidity with which they turn out work. Not only do they turn out goods in a fractional part of the time required by foreign dyers, but the work is better done.¹⁶

There appears to be no doubt that American silk mills are fully as well equipped as are foreign mills,¹⁷ and, according to one witness, the best looms in the world are

¹⁶Vol. XIV: Allen, 678, 674.

made in this country,¹ while another witness states that the facility with which the American mill changes from the manufacture of light to heavy silks, from simple to complicated, from plain to faconné, and from yarn to piece-dyed weaves is remarkable; and it is stated the machinery is such that a simple weaver can do work which in other countries can be done only by the most skilled and experienced workers.² Every style of silk goods, with the exception of a few high-priced specialties, are now manufactured in this country,³ and it is held that American silks and silk velvets are fully equal to foreign-made goods.⁴ In the printing of silks, American manufacturers are said to do as good work as is done in France,⁵ and in the charging of silk to employ more careful methods than those followed in Europe.⁶ American sewing silks are acknowledged to be the best in the world.⁷ Many fabrics are made which are a combination of silk and other materials, as cotton or wool. It is stated, however, that these goods are sold for what they are and not as pure silk textiles.⁸

Raw silk and silk culture.—Although there seems to have been a good deal of honest effort made to establish silk culture in this country, no success in that direction has been achieved.⁹ This seems to be due entirely to the fact that labor in this country is expensive and that it is impossible for Americans to compete with the cheap labor of European and Asiatic countries, as in some parts of the United States both climatic conditions and soil are favorable for the raising of silk worms.¹⁰

Of the countries from which raw silk is imported into the United States, Japan, it is stated, was in the lead in 1900 both in respect to the number of pounds imported and to the value of imports; China came second in respect to the number of pounds, third in respect to the value of imports, and Italy came third in respect to the number of pounds and second in respect to the value of imports.¹¹ American manufacturers, it is stated, use only the best qualities of raw silk.¹²

Prices of silk textiles.—Witnesses state that the prices of silk are controlled by market conditions rather than by cost of production.¹³ It is safe to say, however, that prices have materially declined in the last 20 years, one witness stating that silks can be bought at the present time for half the prices charged for the same grades 20 years ago.¹⁴ If the silk industry in this country should be destroyed, American consumers would, according to another witness, undoubtedly have to pay much higher prices for silk goods.¹⁵

Foreign trade.—Importations of silk goods appear to be practically limited to specialties, high-grade novelties, and to the very cheapest grades of silks.¹⁶ At times, foreign silk manufacturers have dumped their surplus stocks in the American market, selling them at prices as low as were necessary to enable them to dispose of their goods. This has been largely done away with, however, it is stated, by the imposition of specific duties on silks.¹⁷

There is no export trade as yet in silk manufactures,¹⁸ and, according to one witness, that is not to be expected at present, as the cost of production is too great and the wages paid are too high to admit of it.¹⁹

The silk industry and the tariff.—Not only is it the opinion of witnesses that the silk industry owes its existence in this country to the protective tariff, but it is also their belief that the industry is still dependent on tariff protection²⁰ and that a material

XXXII · INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

reduction in the tariff on silks would have a most depressing effect on the silk industry,¹ and would result in an immediate reduction of wages.² One witness thinks that it is possible that, in case the tariff were removed, American manufacturers would transfer their machinery to foreign countries, use American methods of manufacture, and produce goods there for the American market.³ During the years from 1893 to 1897, under the Wilson tariff, it is stated, the industry was in a depressed condition and few mills ran on full time.⁴ So far as sewing silk is concerned, it is thought that the duty could be lowered perhaps 50 per cent without inflicting any injury upon the industry, but in the opinion of the witness making this statement the consumers would reap no advantage from a lowering of the duties.⁵

Specific duties are favored by witnesses⁶ on the ground that they afford less opportunity for undervaluation than is offered by ad valorem duties, and the extension of specific duties on silks, by the provisions of the Dingley law, is approved of.⁶

PLUSH TRADE.

Previous to 1883 all mohair, car, and furniture plushes were imported. In the spring of that year the first crushed furniture plush of American manufacture was put on the market, but it was not until the summer of 1884 that mohair plushes satisfactory to American consumers were produced in this country. As soon as American plushes were put on the market, foreign manufacturers reduced their prices to American jobbers and continued to make great reductions in prices for the three years following the beginning of American competition. As there had been no change in the cost of mohair during that time, the reduction in price, it is declared, must be attributed solely to the competition of American producers.

It is stated that American manufacturers have been greatly handicapped by the undervaluation of imports, but that they nevertheless have been able, under the tariff protection afforded to them, to meet foreign competition, and that a considerable number of factories which compete actively with each other have been established. As a result of home competition the prices of plush to the American consumer have decreased by from 33½ to 40 per cent from the prices which prevailed previous to the establishment of the industry in this country. During the last three years business has been prosperous, though under the operation of the Wilson law it is stated to have been in a depressed condition.⁷

LINEN THREAD TRADE.

The amount of linen thread consumed in the United States is said to equal the amount consumed in all the rest of the world, and nine-tenths of the thread consumed is the product of American mills. The establishment of linen-thread manufacture in this country is attributed to the protective tariff, and the statement is made that if the present tariff duties should be repealed or lowered the linen-thread industry would be transferred to foreign countries. There are reported to be eight linen thread mills in this country altogether. Four of these mills distribute their product through the Linen Thread Company, a company formed specifically for the purpose of distributing their goods. All the flax used by the mills represented by the Linen Thread Company is imported, some being imported in the rough state and some after being hackled. It is said to be more profitable to have tow spun in Ireland and to import the yarn than to manufacture the yarn in this country.⁸

BOOT, SHOE, AND LEATHER TRADES.

Development of boot and shoe manufacture.—The first radical change from old hand methods in the manufacture of boots and shoes came in 1860, when the McKay sewing machine for sewing soles to uppers was invented and put into use.¹ Since that time other machines have been invented and the industry has been completely revolutionized.² The effect of the introduction of machinery, according to witnesses, has been to cause an infinite subdivision of labor;³ to decrease cost of production, and therefore to lower prices;⁴ to improve the quality of shoes;⁴ to give a great variety of styles,⁵ and, on the whole, to make it possible for one to obtain at the ordinary shoe store as thoroughly satisfactory shoes as those made to order and at much lower prices.⁶

The output of boots and shoes has increased very materially since 1860, the total output for that year, both factory and custom work, according to figures compiled from the census reports by Mr. C. H. M'Dermott, editor of the Boot and Shoe Recorder, being \$91,889,298, while in 1890 it was \$255,180,698.⁶ The leading position in the manufacture of boots and shoes has from the first been held by New England. The census report of 1860 shows that in that year 59.6 per cent of the total output of boots and shoes was produced in New England. In 1890, of the total product of both factory and custom-made goods, 56.5 per cent was manufactured in New England, and of the factory product alone 63.4 per cent. It appears also that the wages per capita and the product per man are greater in New England than elsewhere.⁷

Referring to the quality of American shoes, one witness states that American manufacturers lead the world in shoe styles, and that the American shoe combines the grace and beauty of the French shoe with the stability of the English shoe and without its clumsiness.⁸

Leather manufacture.—It is the belief of one manufacturer of leather that in spite of the high wages paid in this country leather can be manufactured here as cheaply as anywhere because of the use of improved and scientific methods of tannage.⁹ The new chemical process of tannage which has come into use within the last 20 years, is said by one witness to be a special process for the tannage of goat skins.¹⁰ It is stated by another witness, however, that the new process is applicable to all kinds of leather.¹¹ The glazed kid produced by this new process of tannage has driven French kid from the American market, and is even being sold in France in competition with the home product. The glazed kid is more durable than French kid and can stand exposure to the weather better, while at the same time it is much cheaper, being sold at from 20 to 25 cents a square foot, while French kid costs from 60 to 70 cents per square foot.¹²

Foreign trade.—There is a considerable export trade in leather, the exports for 1900 having amounted to more than \$20,000,000. The imports of leather for the same year amounted to something over \$6,000,000.¹³ The export trade in boots and shoes, it is stated, has been constantly growing for the past 10 years, the growth during the last three years having been especially marked. The principal markets for American shoes are found in Great Britain, Australia, the West Indies, Canada, Mexico, and Central America.⁷ The growth in foreign trade is attributed to the fact that American manufacturers have made more of an effort to sell goods abroad than was

¹ Vol. XIV: M'Dermott, 496.² Vol. XIV: Howe, 486; M'Dermott, 496.³ Vol. XIV: Howe, 478.⁴ Vol. XIV: M'Dermott, 499.⁵ Vol. XIV: Howe, 486.⁶ Vol. XIV: M'Dermott, 500.⁷ Vol. XIV: M'Dermott, 499, 500.⁸ Vol. XIV: Schober, 344.⁹ Vol. XIV: Foerderer, 319.¹⁰ Vol. XIV: M'Dermott, 508.¹¹ Vol. XIV: Foerderer, 317.¹² Vol. XIV: Foerderer, 315, 316.¹³ Vol. XIV: M'Dermott, 507, 508.

XXXIV INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

formerly the case. The growth of competition at home, especially the growth of Western competition, has made it more difficult to sell shoes in the American market, and Eastern manufacturers have been led to look to foreign markets.¹ Quite a trade with Cuba had been worked up by one firm of American manufacturers, but this trade was very largely destroyed when the rebellion in that island broke out and has not since been regained.² One manufacturer testifies that he sells about 10 per cent of his total output in foreign markets, the largest trade being with Australia. The goods are sold for cash, a draft being made against the bill of lading.³ The prices made on exported goods are stated to be practically the same as those for which similar goods are sold in this country.⁴ Practically no boots and shoes are imported.⁵

Combination in boot and shoe trade.—At present there is active competition in the boot and shoe manufacturing industry, and it is stated that there is no agreement whatever among manufacturers in respect to output, prices, or wages.⁶ The formation of a combination is thought desirable by one witness, who states that some attempt has been made, though unsuccessfully, to bring about a consolidation of interests.⁷

The possibility of forming a combination of boot and shoe manufacturers is doubted by witnesses, on the ground that the business is too complicated and the interests too varied and too widely separated to permit it.⁸ Most of the concerns engaged in the manufacture of boots and shoes, it is stated, are partnerships, though the number of corporations is growing.⁹

The tariff on hides.—Shoe manufacturers in general, it is stated, consider the tariff on hides a handicap, but, in the opinion of the witness responsible for the statement, they exaggerate the effect, and the sentiment in favor of a change in the hide tariff is not so pronounced as it was at first. The fact that in 1872 when the 10 per cent duty on hides was removed, the price of imported hides advanced by the amount of the duty is referred to by this witness, and the recent advance in the price of hides is attributed to the great decrease in the domestic supply, and to the return of general prosperity rather than to the duty on hides. It is pointed out that, assuming that the duty on hides increases the price, the percentage of increase in the price of leather would be equal to only one-half the rate of duty on hides, because the cost of the hide represents approximately only one-half the cost of the leather; and that, inasmuch as the leather in the shoe represents roughly only one-third of the value of the shoe, the percentage of increase in the price of the shoe would be equal to only one-sixth the rate of duty on hides. Attention is also called to the fact that there has been a general decline in the price of shoes since the duty on hides was imposed, and that the exportations, both of leather and of boots and shoes, have increased.¹⁰ One manufacturer testified that, in his opinion, the duty on hides handicaps the export trade in boots and shoes a little, but not very seriously, and that he himself finds it no obstacle,¹¹ while another manufacturer thinks the duty a great injury to the shoe manufacturer and wants it abolished. In the opinion of this witness the meat packer gets the principal benefit from the duty, and the price of cattle is not affected by it.¹² The drawback on exported leather, or leather goods, equal to the duty on the imported hides used in their manufacture is held to be an advantage to the manufacturers of leather, but not a particular benefit to the manufacturers of boots and shoes.¹³

The tariff on boots and shoes.—The tariff on boots and shoes is thought by witnesses to have no practical effect on the industry. The retention of the tariff is advocated

by one witness, however, on the ground that foreign competition in the future, as foreign manufacturers are ^{one of} dangerous for- of the most improved shoe machinery and have a great advantage in the price labor.¹ Another witness, however, does not fear foreign competition, even if American machinery should come into general use, because of the lower intelligence of foreign workmen.²

Shoe machinery—United Shoe Machinery Company.—Under the trade custom now followed, little, if any, shoe machinery is sold outright to shoe manufacturers, but the machines are almost exclusively put out on rental and royalty under agreements made between the owners of the machines and the manufacturers of boots and shoes.³ The amount of royalty to be paid is based on the extent to which the machine is used, indicators being attached to machines to show how much use is made of them.⁴ Practically the same terms it is stated are made to the small as to the large manufacturers.⁵

In the manufacture and control of shoe machinery the United Shoe Machinery Company holds a commanding position. It is claimed, however, that the company has a monopoly only to the extent to which it has secured control through the possession of patents and through its enterprise in furnishing manufacturers with the best machinery. It is admitted, however, that it would take a new company quite a number of years to reach the efficiency and to be able to offer all the facilities that the United Company is able to offer. The company confines its own business to the United States and to Australia, but controls corporations in other countries through which it controls practically the whole of the manufacturing territory of Europe.⁶ There are other concerns manufacturing similar machines,⁷ but it seems that it has been the custom of the United Company to rent its machines to manufacturers only on condition that they use them in conjunction with other machines manufactured by it to the exclusion of those of other concerns.⁸ This the company has been able to do, as it would be difficult to conduct a shoe factory successfully without using some of the machines controlled by it.⁹ This custom has, however, led to some friction between the shoe manufacturers and the United Shoe Machinery Company, and there have been negotiations in reference to it between the New England manufacturers and the managers of the company. As the result of these negotiations, there have been some modifications of the terms of the agreements, and at the present time the shoe manufacturer is not prohibited from using the machines of other concerns, but is simply given better rates if he uses all the machinery of the United Company in his factory which he can use to advantage.¹⁰

The United Shoe Machinery Company is a consolidation of several concerns which were formerly engaged independently in the manufacture of shoe machinery. Stock of the new company was exchanged for the stock of the constituent companies on an agreed basis. At first each separate company retained its own business, but later all the assignable property possessed by the different concerns was conveyed to the new company, and the intention is that in time all property of every form possessed by the constituent corporations shall be vested in the United Shoe Machinery Company.¹¹

Before consolidation the separate companies were obliged to maintain agencies in all the shoe manufacturing centers, at which agencies there had to be a superintendent, one or two clerks, and a number of trained men familiar with the construction and operation of the machines rented, whose duty it was to see that the machines were kept in good running condition. It was thought that one set of men in each place could look after the machines as well as three sets of men, and this, it is stated,

¹¹ Vol. XIV: Howe, 494, 495.

XXXVI INDUSTRIAL COMMISSION:—MANUFACTURES

the combination. Another reason was the principal reason for the enabled to obtain advantages from patents which that all the be controlled by one company exclusively.¹ It is stated that more workmen are employed in the factories of the United Shoe Machinery Company than were ever employed by the constituent companies, and that the number of men employed at the agencies established throughout the country for the purpose of superintending the erection and operation of machines has not been reduced, as might have been expected, the reason for this being that business has greatly increased since consolidation as a result of general prosperity, and that better service has been rendered to the manufacturers and therefore the use of machinery extended. Wages have remained substantially the same since consolidation.² There has been some reduction in the rental charges for machines.³

It is claimed that the formation of the combination has not had the effect of cutting off inventions and that there has been no diminution of invention in any direction. It is stated to be the policy of the company to foster new inventions and to improve machinery as much as possible in order to maintain its hold on business and to be able to supply manufacturers with the best machines. Men are continually employed for the purpose of devising new inventions.⁴

The foreign trade in shoe machinery is said to be increasing very rapidly, especially in Germany. The United Shoe Machinery Company has a small factory in Frankfurt with American superintendents and two or three American workmen.⁵

In the opinion of an officer of the United Shoe Machinery Company, the reduction of the tariff on steel would have no effect whatever on the shoe machinery industry, as the value of the raw material which enters into shoe machinery is so slight in comparison with the value of the labor that is put into it that a diminution of 50 per cent in the cost of raw material would represent very little difference in the cost of the machines. So far as the tariff on shoe machinery is concerned, it is said the patents and the skill in manufacture possessed by the manufacturers in this country would enable them to control their own market if the tariff were removed.⁶

IRON AND STEEL PRODUCTS—MACHINERY—LOCOMOTIVES.

Locomotives and railroad equipment.—The locomotive of to-day is a vastly different piece of mechanism from that of sixty years ago. At the beginning of railroad operations in this country the locomotive in use had but a single pair of driving wheels and weighed probably not over 12 or 16 tons. Later 2 more driving wheels were added and were coupled together. Afterwards locomotives were built with 6 or 8 driving wheels, which were coupled, and were increased in weight until to-day freight locomotives of 100 tons and passenger locomotives of from 70 to 80 tons are the rule. Forty years ago the tenders built had a capacity of about 2,000 gallons, while the tenders of to-day have a 7,500 gallon capacity. One of the greatest improvements in the manufacture of locomotives has been the substitution of steel for iron to a great extent. The boilers now made are capable of bearing a steam pressure of 200 pounds to the square inch, whereas thirty or forty years ago 100 pounds was the ordinary pressure. Steel rails weighing 100 pounds to the yard are to-day used on the roads of heaviest traffic, and cars are built to carry a load of 50 net tons. Forty years ago railroads were, for the most part, laid with iron rails weighing less than 60 pounds to the yard, and 10 tons of freight was considered the maximum carload.⁷

There are reported to be some 10 large locomotive works in the United States, the Baldwin Locomotive Works of Philadelphia being not only the largest of these but

¹ Vol. XIV: Howe, 483.

² Vol. XIV: Howe, 485, 487.

³ Vol. XIV: Howe, 490.

⁴ Vol. XIV: Howe, 485, 489.

⁵ Vol. XIV: Howe, 489.

⁷ Vol. XIV: Converse, 231, 232.

the largest in the world. In 1900 these works turned out 1,200 locomotives of a value of between \$16,000,000 and \$17,000,000. As a rule it is stated the railroad companies do not manufacture their own locomotives, but buy them from regular locomotive manufacturers.¹

The Baldwin Locomotive Works own a patent for a compound locomotive which is largely used both in America and abroad. Aside from this, however, it is stated that there are no patents covering any important features of locomotives.²

Locomotives have been exported for the last forty years, and a large export trade has been built up. At first the trade was confined chiefly to Cuba and South America, but within the last 25 years it has been extended to the Eastern Hemisphere, and its growth has been very great in the last 10 years. American locomotives are now sent to almost every country where railroads are in operation, some locomotives having been sent to England, France, Germany, and Russia. The Russian Government, it is said, orders locomotives abroad only when the Russian works can not supply the demand. As in most European countries the railroads are controlled by the government, foreign tariffs cut no great figure in the American export trade. The advantages possessed by American locomotive builders are said to be found in the great capacity possessed by their plants, and in their excellent facilities, which make it possible to fill a large order in a very short time; in the superiority of American locomotives in respect to size, type, and details; and in the fact that American locomotives can be built at a less cost per unit of weight than the ordinary European locomotives. The export business of the Baldwin Locomotive Works constitutes a quarter to a third of its whole trade, and the company has agencies in England, Norway, Sweden, Russia, China, Japan, and Germany. Long credits are not given by this company, but the larger part of the price of a locomotive is ordinarily paid when the contract is completed, a small percentage being retained for a time as a guaranty against defects.

The locomotives sent abroad are substantially the same in type as those used in America, but are much lighter and less powerful than the average American locomotive. American and European locomotives, it is stated, have been growing more and more alike in type, the two principal points of difference now being the use of the bar frame in America and of the plate frame in Europe, and the invariable use of outside cylinders in America, while inside cylinders and crank axles are largely used in Europe. The prices charged for locomotives sent abroad are practically the same as the prices for which they are sold in this country.³

Mr. Converse, of the Baldwin Locomotive Works, is of the opinion that foreign locomotives would not be imported into this country if there were no duty at all upon them. He knows of only one locomotive which has been imported in 25 years, and that was brought in simply as a sample of a new type and of English workmanship. The materials used in locomotive manufacture are not imported except in cases where a preference is expressed for certain appliances or parts of foreign manufacture. When these materials are imported, a drawback of the tariff paid on them is obtained when the locomotives into which they enter are exported.⁴

Business conditions, so far as locomotive manufacture is concerned, are reported to be more prosperous at the present time than in the years immediately following 1893, this being attributed to the general prosperity of the country, the large demand abroad for American agricultural products, the great development of railroad transportation, the sound financial condition of the country, and the fact that a drawback is given on foreign-made materials used in locomotive manufacture when the locomotives are sent to foreign countries.⁵

⁵ Vol. XIV: Converse, 234.

XXXVIII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

Some efforts have been made to form a combination of the locomotive works of the country, but they have thus far been without success, as certain of the manufacturers do not favor the project.¹

Power engines.—With the general improvement in business conditions in recent years came a great demand for power engines. The greatness of the demand is attributed by one witness, a manufacturer of steam engines, to the fact that because of the industrial depression, which began in 1893, manufacturers continued to use their old engines instead of buying new ones, and that when business revived the normal demand was increased by orders which, under prosperous conditions, would have been placed a year or two earlier. The cost of production of steam engines is stated to be apparently no greater in this country than abroad in spite of the fact that higher wages are paid here, because of the greater skill of the workmen and the ease with which they adapt themselves to improved methods.²

Armor plate.—The profit on armor plate is stated to be very large, one witness estimating it at 23 per cent,³ while another witness says that the profit is "something enormous."⁴ The large profits are justified by both these witnesses, however; by one on the ground that an immense outlay of money is necessary in order to build an armor plant, and that the business is not continuous;⁴ by the other because of the great risk of rejection. This witness states that when tests of armor plate are made by the Government the separate pieces are not tested, but that the whole lot is accepted or rejected according to the results of two shots, and that if the plate is rejected it is a total loss. The specifications under which armor plate is made for the United States Government are stated to be more severe than the specifications made by any foreign government.⁵

Drop forgings.—There are stated to be a large number of concerns in the country manufacturing drop forgings, and all competing actively with each other, not only in the domestic market, but also in foreign markets.⁶ Drop forgings of all kinds are sold abroad, and one manufacturer reports that about one-eighth of the products manufactured in the works of his company are exported. Some few of the exported goods of this company are sold at lower prices in the foreign market than in the domestic market, but many of the goods are sold at higher prices abroad than at home. The company simply meets the market and gets the largest price it can.⁶

Transmission machinery.—Transmission machinery manufactured in this country is sold all over the world. One manufacturer dates the beginning of his export trade from the business depression of 1893, when, on account of the falling off of domestic trade, he was forced to look abroad for a market.⁷

Prices of steel products.—The fluctuation in the prices of steel products in 1900 is attributed by witnesses to the law of supply and demand⁸ and to changes in the prices of raw materials,⁹ rather than to the arbitrary action of the steel combination. The formation of the United States Steel Corporation is thought, by one witness, to have had the effect of steadying prices.⁹

OPTICAL INSTRUMENTS.

Mr. Gray, secretary of the Manufacturers' Club of Philadelphia and a manufacturer of optical instruments, states that in many cases the demand for foreign instruments by educational institutions is due to the fact that the younger professors have studied abroad and have the idea that it is the proper thing to use foreign-made instruments; and he cites a case coming under his own observation in which American made microscopes were offered to an American university at prices lower than

¹ Vol. XIV: Converse, 294.

⁴ Vol. XIV: Cramp, 420.

⁵ Vol. XIV: Redfield, 657.

⁶ Vol. XIV: Redfield, 651, 657, 658.

⁷ Vol. XIV: Cramon, 265-266.

⁸ Vol. XIV: Redfield, 658.

⁹ Vol. VII: Schaffer, 397.

those for which foreign microscopes could be imported, and the microscopes approved by the instructors who were to use them, and yet German instruments were purchased at the direction of the professor in charge of the department, who had studied in Germany.

By the provisions of the present tariff law no duty is levied on optical instruments imported for institutions of learning. In selling to an educational institution, therefore, it is necessary for American manufacturers to meet the free-of-duty price of foreign instruments. Necessarily, the same price made to educational institutions must be made to individuals. Though the wages paid to the workers employed in the manufacture of optical instruments in the United States are much higher than the wages paid in Germany, this difference, it is stated, is largely overcome by division of labor and by the use of special machinery and tools. Yet in some cases articles which are not made in large quantities, it is stated, can be imported for educational institutions for less than they can be made in this country; and therefore it is claimed that it would be of great advantage to the optical instrument industry in the United States if the provisions of the tariff law admitting free of duty instruments imported for educational institutions were changed.¹

SHIPBUILDING.

Development and growth.—Shipbuilding, according to Mr. Cramp, of the William Cramp & Sons Ship and Engine Building Company, has been the prime industry of Philadelphia since the founding of that city, the promotion of the industry having been begun by William Penn. From 1781 to 1790, during which years the defense acts of the Continental Congress remained in effect, the records, though somewhat imperfect, show that at least 162 vessels, aggregating 18,000 tons registry, were built in Philadelphia. With the exception of a frigate which was presented to the King of France, no ship larger than 300 tons was built at Philadelphia during this period. In the period of depression which followed the war of 1812 there were constructed at Philadelphia a considerable number of ships for foreign countries, including both merchant ships and men-of-war. Two Philadelphia ships, originally built for the China trade, were, in 1830, sold to the English East India Company; but this caused such a commotion in England that the British board of trade took action which resulted in closing the British market to American built ships, the British authorities insisting that their merchants must have their ships built in England, even though they had to import construction materials.

Steam navigation, according to Mr. Cramp, was inaugurated at Philadelphia by the building of the first American steamboat in 1790. In 1809 a steamboat line to run between Philadelphia and Trenton was established, and from that time on it is stated steam navigation on the Delaware has been uninterrupted, though it was not for some years after the establishment of this line that steam navigation became of any importance.

The pioneer seagoing armored battle ship of the American Navy, the *New Ironsides*, was built by the Cramp Company just previous to the outbreak of the civil war. At that time armored ship construction was in its infancy, and there was little to guide the builders either in respect to design or construction. This ship is said to have been of an entirely unique design and to have been considered the most formidable seagoing ironclad of the time, having proven herself invulnerable to any of the ordnance of that day.

Speaking of the Holland submarine boat, Mr. Cramp says that the fear of the submarine boat or ram or torpedo boat is chiefly the fear of the unknown; that there have been many reports during the last forty or fifty years of sudden revolutions which were to take place in naval architecture and to bring about a new order of things, but that they have not materialized, and that the great changes which occur in battle ships and other ship construction are of slow growth.

¹ Vol. XIV: Gray, 208-218.

XL INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS

In 1870, as a result of efforts to regain the position of a maritime commercial power, which the country had lost through the civil war, the American Steamship Company was formed and four ocean steamers were built. These ships, which were commissioned in 1872 and 1873, are said to have excelled in speed the fastest trans-Atlantic steamers which had been built up to that time. Furthermore, as a result of the introduction of the compound engine, it is stated, the ships could be run much more economically than could the fast ocean liners built previously. For a time these ships attracted their share of trans-Atlantic traffic, but they finally succumbed to the competition of their subsidized British rivals and passed under the control of the International Navigation Company.

Shipbuilding was started on the Pacific coast during the years 1885 to 1890, when the Union Iron Works received some contracts from the Government. War ships, for the most part, have been built in the Pacific coast shipyards, but a limited number of coastwise boats have also been built there.¹

Facilities for shipbuilding.—American shipyards are stated to be better equipped than are the yards of other countries. Great Britain, however, is beginning to make larger use than formerly of American devices and inventions.²

The opinion is strongly advanced by Mr. Cramp that the ideal shipbuilding plant should possess all the facilities necessary for building a first-class war ship complete, ready to go into action, including not only the hull, machinery, and equipment, but also the armor, guns, and ammunition, and he states that he has been for years endeavoring to enlarge his plant and extend its capacities so as to be able to do this, and that he has laid his plan before various steel manufacturers both in this country and abroad. There are several shipbuilding plants in Great Britain, one in Germany, and one in France which are building fully equipped war vessels. The extension of the scope of a shipbuilding plant in this way, it is stated, would be an entirely different matter from forming a combination of shipyards, and would conduce to the more perfect independence of the separate yards, and be in line with what has already been done. Formerly, the various constructive trades which are now embraced in one shipbuilding plant were carried on entirely independent of each other. The shipowner made separate contracts for the building of the hull, for painting, for blacksmithing, for shipsmithing, for spar making, for sailmaking, and for rigging. In the case of steamships, separate contracts were made for the hulls and for the engines. As a result, the cost of construction was greater than if all the work had been done under one management, and there was difficulty in fixing the responsibility in case a ship failed to come up to the required speed.³

A combination of shipyards, Mr. Cramp thinks is impossible, while Mr. Harrah, of the Midvale Steel Company, sees no particular advantage to be gained by combining.⁴

Cost of ship construction.—It is stated to be impossible to give a direct positive or negative reply to the question whether a ship can be built as cheaply in the United States as in England, as the cost of the construction depends partly on the ship and partly on the builder. Every shipbuilding plant has methods peculiar to itself, which are expressed in the ships which it builds and which distinguish the ships sent out of its yards from ships built elsewhere. It is impossible, therefore, it is said, for one shipyard to duplicate exactly a ship built in another yard. Comparisons as to the cost of shipbuilding must be made on the basis of estimating the different amounts for which ships capable of doing exactly similar work can be built in different yards. At a rough estimate, however, the difference in the cost of construction of a first-class steamship in American yards and the cost of construction in English yards is put at 15 per cent.⁵

¹ Vol. XIV: Cramp, 389-404, 421.

² Vol. XIV: Cramp, 414.

³ Vol. XIV: Cramp, 418, 420.

⁴ Vol. XIV: Harrah, 806; Cramp, 417.

⁵ Vol. XIV: Cramp, 406, 407, 408, 414.

Government ships.—It is the practice of the British Government to have its vessels built in private yards, and practically all the ships which have been built for the British Government up to the present time have been built in private yards at liberal prices. The practice of the British Government in this respect is held to have resulted advantageously, in that it has led to the building up of great shipbuilding plants which have been of much assistance in the building up of British fleets and to the establishment of numerous dry docks. Some years ago, two cruisers for the American Navy were built in Government yards, but at the present time all ships for the Government are being built in private yards.¹

The custom of the United States Government in calling for competitive bids for the building of Government ships is disapproved of by Mr. Cramp, and the practice of the trans-Atlantic steamship lines is thought to be much wiser and better. These companies, it is said, have, as a rule, each its particular or favorite builder, and the builder's type of ship becomes the company's standard. The plan followed in building is to charge the company for materials and for labor, and then to add a certain amount for operating expenses and for profit, terms and percentages being fixed. The making of inflexible, written stipulations by the United States Government, it is held, ties the hands of both the Government and the contractors and is likely to lead to embarrassments which could be avoided if a little more lee-way were given.²

AMERICAN MERCHANT MARINE.

The chief reason for the failure of American money to find investment in trans-oceanic steamship lines is believed by witnesses to be the greater cost of running American ships, which results from the fact that higher wages are paid on American ships than are paid on foreign ships.³ The greater first cost of a ship is held by one witness to be not only not the chief factor in preventing the upbuilding of an American merchant marine, but to be not even a serious factor. The difference in first cost, it is stated, could be overcome somewhat, but the greater cost of running the ship is continuous.⁴ One witness advocates the granting of subsidies to overcome the disadvantages under which American ships labor,⁵ while another witness is doubtful of the wisdom of offsetting the difference in the cost of running ships by subsidies.⁶ Still another witness is so desirous of seeing a merchant marine built up that he professes himself as ready to accept anything which will be effective in counterbalancing the disadvantages under which Americans now suffer from the greater expense of running American ships.⁷ Personally, this witness favors the policy of discriminating duties,⁸ but, failing to secure the adoption of that policy, he is in favor of the payment of ship subsidies, and believes that the subsidizing of American ships would be for the benefit of the whole American nation.⁹ This witness says also that because of the great need for ships which there is at the present time he is willing to make a concession to the free-ship men and is in favor of admitting foreign ships to registry, provided ships of equal tons and classes are built in American shipyards.¹⁰

TRANSPORTATION PROBLEMS.

Matters relating to transportation have been specially treated of elsewhere.¹¹ The close relation between conditions of transportation and general business interests, however, have led certain witnesses who have devoted their attention mostly to matters pertaining to manufacture and general business to touch upon questions relating specifically to transportation.

XLII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

One witness expresses disapproval of any proposition to give to the Interstate Commerce Commission the right to fix freight rates in the first instance, on the ground that the railroad managers are more competent to compute the cost of transportation and the tariff required on different classes of freight than is any board of railroad commissioners, though he thinks that it might be desirable to require the approval by the Interstate Commerce Commission of the rates fixed. The giving to the commission of the power to compel railroads to come before it and make defense is approved of.¹ This witness believes that the prohibition of pooling has led to abuses, and thinks that if pooling were allowed, under the supervision of the Interstate Commerce Commission, it would probably be a good thing.² Consolidation of railroads is favored, on the ground that the unification of smaller and weaker roads into one strong system brings about greater economy in operation and results in a more satisfactory public service.²

The route from the West to New England via Canadian lines for a part of the distance is considerably shorter than the route via American lines exclusively, and therefore it is held that the abolishment of the transit-in-bond privilege would work great injury to New England interests.³

The watering of railroad stock is complained of by one witness, and the opinion expressed that if it were not for the inflated capitalization of roads freight rates would be lower than they are.⁴ One witness expresses opposition to the enactment of any antiscalping law, and believes that the effect of such a law would be to permit combinations among railways which would be injurious to the public generally.⁵

Government ownership of railroads, telegraphs, and street railways is advocated by witnesses and somewhat discussed,⁶ and it is held by one witness that freight rates are not as low as they could be under Government ownership.⁷ In New Zealand the Government controls the railroads, the telegraphs, and the telephones, and all the Australian colonies have railroad laws substantially similar to those of New Zealand. In each case the management of the railroads is vested in a commission of 3 experts, who lay before Parliament every year a full account of their doings. The law provides that the roads be made to pay the cost of maintenance and, as nearly as possible, a 3 per cent dividend on the capital cost. The amount of transportation furnished by the Australian roads is greater per capita, it is stated, than that furnished by American roads, and is furnished for less cost, in spite of the fact that a great part of the equipment has had to be imported, while the service is as good as that given by the average American lines. It is stated also that twice as many telegrams per capita are sent in Australia as are sent in America, the cost of transmission being only half as great.⁸

ADULTERATION OF FOODS.

Adulteration of food products is touched on by witnesses, and the opinion is expressed that the stringent State laws which have been passed have led to a decrease in the amount of adulterated food products put on the market.⁹

GENERAL CONDITION OF THE WORKING PEOPLE.

Bishop Potter particularly deplores the increasing alienation and misapprehension of social classes. He and his associates on the voluntary board of mediation and conciliation in New York City have found in the workmen a degree of intelligence, and especially an instinct of fairness, with which they are rarely credited. Mr. Wyckoff, during his experiment as an unskilled laborer in Chicago, made it a point to attend the meetings of socialists and anarchists and to make the acquaintance of their leaders. He did not find many professional agitators. Both socialists and anarchists were almost exclusively working people and largely of the skilled artisan class. It seemed to him, however, that the majority of the rank and file were not thrifty and were men who did not keep their jobs very long. The socialists were evolutionary and in no way destructive in their opinions. While they strongly contrasted the capitalist class and the wage-earning class, he heard no violent speeches. The socialists seemed to regard the capitalist class, as well as the proletariat, as the result of evolution. They considered that the capitalists were not to blame for the condition of things. Among the anarchists, on the other hand, Mr. Wyckoff found a strong hostility to the capitalist class. Many of them, especially of those who called themselves communistic anarchists, he found to believe in the violent overthrow of the present organization of society.¹

All the witnesses who spoke of the general condition of the working class as compared with what it was 20 or 30 or 50 years ago, agreed that it has improved. Money wages have increased, and the cost of particular commodities has, in general, diminished. The standard of life has accordingly risen. One witness notes, however, that the acquirement of some things which were luxuries in former years has been accompanied with the loss, in city communities, of wholesome things, such as chickens and good meat, pure milk and butter, which every workingman was able to have in the smaller communities of earlier times.²

Whether the conditions of the working people had improved within a shorter period, such as ten years, is not a matter of such general agreement. One witness, testifying in the spring of 1900, thought that though wages in the strongly organized trades were fully as high as they were ten years earlier, wages in the trades which were not firmly organized when the hard times came on were probably 10 per cent lower than before the panic of 1893. He thought that this was true in spite of some increase of wages, amounting to perhaps 8 per cent in his own city of Indianapolis, within the two years preceding his testimony. Mr. Wright, United States Commissioner of Labor, testifying at the end of 1898, declared that wages had constantly decreased since 1893, though within two or three years there had been a slight reaction in factory employments.³

One or two witnesses, comparing the condition of working people in the United States and in European countries, think that the difference is less than it is popularly thought to be. One even holds that, in view of the comparative advantages of the two countries, the advancement in skill and enterprise, and the standards from which each started, the working classes of England are to be considered fully as well off as those of the United States. In confirmation of this he says that there is but little immigration from England to the United States, and that many who have come have returned. Mr. Willoughby, of the United States Department of Labor, while considering that the conditions of labor are undoubtedly better here, upon the whole, than in any European country, thinks that the coal miners are better off in Europe than in the United States, and that the British workmen in the steel trade, while not

XLIV INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

getting as high wages as ours, have more constant work and are better taken care of through various relief organizations. European workmen in general have more certain conditions of life. The German workman has the consciousness of protection against the pecuniary results of accident, sickness, old age, and death, through insurance provided by the state.¹

The differences which exist between European countries and America, in the condition of the working class, are attributed to various causes. The chief are the great domain of rich soil which we have had at our disposal; the climatic conditions, which require better food and clothing and housing, and have helped to lead the workman to demand wages which will buy these things; the greater activity and productivity, which are believed to result both from the climatic conditions directly and from the more adequate nourishment; and the fact that the working people of Europe have emerged from a condition of serfdom to which the workers of America, except the negroes, were never subjected. The negroes of the South, it is declared, are in a position more like that of European workmen.²

Several manufacturers refer to the superior energy and productive power of the American workman. To this the possibility of cheap production in the United States is attributed. It is declared that foreign workmen become more efficient, in a marked degree, after they have been a short time in this country. One manufacturer of worsted and woolen goods, however, thinks that the English working people in his line do better work than the American. This, he thinks, is because the English masters are able, on account of the surplus of good labor, to be more exacting and to require more careful work.³

Unemployment.—It is disputed whether unemployment has increased upon the whole, say within 20 or 30 years; but no witness supposes that it has decreased. The difficulty of finding employment when one is past the prime of life is particularly noted. Mr. Wyckoff, in his experience as an unskilled laborer, found the army of the unemployed a very genuine phenomenon in the great centers of population; but in small towns and rural districts he found it surprisingly easy to get work. He admits, however, that the proposition that a man can always find employment is not true of certain localities, or of certain seasons of the year, and that it does not apply to those who are bound, by family ties or otherwise, to the congested centers. Farm work does not, on account of social considerations, offer an opening for a large proportion of the unemployed in the cities. Except on the large ranches of California, Mr. Wyckoff found it the uniform practice of the farmers with whom he came in contact to take their hired men into the house, have them eat at the family table, and make them members of the family. The farm families into which Mr. Wyckoff went have standards of intelligence, morality, and patriotism which seemed to him very remarkable; and it would be impracticable to bring into them the recent immigrant or other types which make up a large proportion of the unemployed of the cities.⁴

The most obvious cause of unemployment in this country, says Professor Commons, is immigration. The high pressure of modern industry, however, with its speeding up of machinery and its increasing requirements of activity, increases the number of those who can not come up to the required standard of performance. The fixed standard wage rates of the trade unions aggravate this difficulty. Without any regard to such standard rates, however, Professor Commons thinks, basing his judgment on the investigations of Mr. Booth, that 10 per cent of the workingmen of England fall below the line of efficiency, either mentally, morally, or physically. In times of industrial depression the number of unemployed is, of course, greatly increased. A comparison of the unemployment of the organized workmen of Great

⁴ Vol. XIV: Wyckoff, 185-191, 195.

Britain from 1887 to 1900, with the changes of general prices, shows that as prices went up unemployment regularly diminished and as prices went down unemployment increased. There is also a regular increase of unemployment in the winter, but workers at seasonal trades regularly get higher wages when they do work, as an insurance against the unemployment which is sure to come. This seasonal unemployment therefore does not present any such problem as that which is offered by unemployment due to industrial depression or to personal inefficiency.¹

The suggested remedies for unemployment are of three classes, the first contemplating a better distribution of population, or some means by which the unemployed shall be brought into communication with persons who want work done; the second contemplating direct provision of employment by the State; the third making room for the unemployed by shortening the hours of labor. One measure of the first class is the publication of labor gazettes, describing the state of employment in different localities and the rates of wages. Such publications exist in France, in Belgium, and in England, and the best in the world is said to be published in New Zealand. Among measures of the second class, aside from special relief works in special emergencies, there is suggested such an organization of those public services of cities which require much manual work, like road making and pipe laying, as will offer most employment when it is most needed. The city of Boston has bought steam machines for thawing out the ground, so that water pipes can be laid in winter. Taking into consideration the way in which the whole staff can be readjusted and organized, it has been found that this method does not involve any additional cost. It makes it possible to give employment in the winter, when work is scarcest, instead of only in the summer, when work is comparatively plentiful.²

Professor Commons adds that if any relief is to be given through State employment the employment must be given directly and not through contractors. This is clearly shown by the unsatisfactory results of the expenditure of a million dollars in public works, through contractors, in Porto Rico. The contractors cut wages and compelled the men to buy from company stores, and the expected benefit did not appear.³

Professor Commons believes that State employment should be provided for certain classes by methods which would make discipline the primary object. By steady and compulsory labor, under proper supervision and training, he believes that a certain proportion of the incapable might be raised to the possibility of self-support in ordinary competitive industries. Epilepsy is cured in the epileptic colony of New York by suitable outdoor work. Ohio is applying similar methods to the feeble-minded, and the Australian colonies to drunkenness. Labor colonies have been established in Holland and in New South Wales. A legal procedure is necessary for commission to such institutions, but it ought to be divested of all idea of penalty. A distinction should be made between compulsory work and penal work.⁴

The lessening of the hours of labor is advocated by many workingmen as a means of absorbing the unemployed into the processes of industry. Aside from the assumption that, the demand for products remaining unchanged, more workers would be needed to supply it, the belief appears that a shortening of hours would lead to an increase of the wants of the working people, and so would increase the demand for products. An increase of wages, it is thought, would have the same effect by increasing the consuming power of the workers. These suggestions seem to be in line with Mr. Wright's opinion that too extensive producing plants are one of the great causes of periods of unemployment. Professor Commons, while advocating the 8-hour day on other grounds, does not believe that it offers a remedy for unemployment.⁵

XLVI INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

Employment agencies.—The commissioners of labor statistics of New York and of Missouri spoke of the free State employment agencies which have been established in New York City, in St. Louis, and in Kansas City. Both these officers regard the State agencies as highly valuable. The other States which have established them are Ohio and Illinois.

Professor Commons and Mr. Reynolds, head worker of the University Settlement of New York City, have no very high opinion of the State employment agencies. Mr. Reynolds says that the one in New York seems to have become practically a women's employment bureau. Professor Commons thinks that the inefficiency of these agencies is due to the treating of them as political places; yet it would perhaps be difficult to get a man at an ordinary salary who would have such connections with employers as would make the office of great service. In Seattle he understands there is a labor bureau controlled by an unsalaried board of business men. Their oversight gives the bureau a prestige which it could not have otherwise.

It is agreed that few things are more needed than efficient labor bureaus or exchanges. The private employment agencies, run for profit, are asserted to be largely fraudulent, and many philanthropic enterprises of the kind have failed. The labor organizations maintain employment bureaus of their own, and look after their own members. It is very difficult, however, for the unorganized workers to find employment without the intervention of some sort of exchange.¹

Intemperance.—Intemperance is referred to by several witnesses as one of the greatest curses of the working people. Poor pay, long hours, and unsanitary and uncomfortable conditions are held to be largely responsible for it. A window-glass cutter speaks of it especially, however, in connection with his own industry, in which wages are high, but the physical requirements are exceedingly severe. Mr. Woods, who is engaged in social settlement work in Boston, considers that the drinking habit results largely from the weakening influences to which the poorer classes are subjected while they are children. Poverty and drink are each a cause of the other, and the weakening of vitality and character almost inevitably leads to drink. Mr. Woods sees a marked improvement in the standards of the young men in the district where he works. They are not total abstainers, but they consider themselves above the low saloon.²

In an extended investigation of unemployment in Chicago during the industrial crisis of 1893, Mr. Hourwich found that drunkenness cut a very small figure. He does not believe that aid was refused on account of drunkenness or bad habits in more than 1 per cent of the cases.³

Hours of labor.—A universal desire is expressed, on the part of witnesses representing labor interests, for a lessening of the hours of work. Eight hours is named by the majority of witnesses as the limit which ought not to be exceeded. Several, including the president of the Cigar Makers' International Union, the secretary of the Boot and Shoe Workers' Union, and a representative of the Bricklayers' Union, think that 6 hours a day, at least in their own trades, would be enough. Mr. Gompers, president of the Federation of Labor, refers particularly to farm labor, and believes that it, as well as labor in other fields, might be and ought to be brought within an 8-hour limit. He points out that employers in several lines, who have said that the day of 8 hours, or even 9 or 10 hours, was impracticable in their particular occupations, have found that it could be made practicable when organized labor forced it upon them.⁴

Two great lines of argument are advanced in support of the desire for the shorter

¹ Vol. VII: McMackin, 808-810. Vol. XIV: Rixey, 61, 75, 76; Commons, 39; Reynolds, 89, 95.

³ Vol. XIV: Hourwich, 166, 167.

⁴ Vol. VII: Spohn, 145; Perkins, 174, 179; Eaton, 366, 372; Gompers, 649, 650.

workday. One is the effect upon the physical, mental, and moral well-being of the workman. It is declared that greater leisure results in a lessening of dissipation and in moral and intellectual elevation, as well as in physical betterment. The second line of argument relates to industrial conditions. It is stated that the product per hour is increased as the day's work is shortened, and Mr. Gompers and Mr. Strasser, formerly president of the Cigar Makers' International Union, are confident that there is no diminution of the product per day. Several witnesses mention specific instances in which hours have been abridged without lessening output. Mr. Gompers and Mr. Strasser are apparently not of opinion, however, that the same man with the same appliances will generally produce as much in 8 hours as in 9 or 10. Their proposition is that increased leisure causes increased opportunity for thought and improvement, and that thought and improvement give rise, on the one hand, to new tools and inventions, and, on the other hand, to new desires, which give opportunities for the use of the new machines. Mr. Gompers also holds that under existing conditions the lessening of hours is necessary to prevent the throwing of large numbers of men out of work by improvements in machinery and processes. He is confident, however, that there is not, upon the whole, any real advantage to the employers in long hours. The Southern textile factories have advantages in the nearness of raw material and the cheapness of labor, but their long day is not in itself an advantage.¹

Many workmen hold that the lessening of hours is likely to raise wages rather than to lower them. Entire willingness is expressed by some to accept a proportional diminution of wages with a lessening of hours, on the ground that the wages will be recovered after a short time. The chief basis of this doctrine seems to be the belief that the lessening of hours would make room for the unemployed, whose competition is regarded as the strongest influence for depressing wages.² The high value which is set on leisure, however, even at the cost of lower wages, is shown by the repeated instances in which wages have been sacrificed to leisure, and the sacrifice has been maintained for years. The bricklayers of Washington, for example, exchanged 9 hours for 8 at the same hourly rate of 50 cents, and have worked for a considerable number of years under these conditions.³

Several witnesses mention the effect of legislation by Congress and by the several States legislatures upon hours of labor. Except in a few States and a few occupations, the effect of these laws is held to have been far less than the effect of direct action by labor organizations. It is to such action that the attainment of the 8-hour day by many workers and of the 9-hour day by many others is attributed. The secretary of the Boot and Shoe Workers' Union, however, thinks that, because of the difficulty of including all workers, even of a given craft, in an organization, governmental action offers the only hope of a universal shorter workday. Legislation is particularly desired for public employees. The law establishing the 8-hour day for employees of the United States Government is especially prized, though it is felt to need important amendments. The three great weaknesses of it are held to be the clause which permits an increase of hours by certifying that an emergency exists, the failure to apply the act to work not done on Government ground, and the failure to apply it to subcontractors. One witness, a manufacturer of granite, feels that his trade would be injured by the extension of the law to workers on granite for public buildings. He sees no reason why wages or hours on public work should be different from those on other work.⁴

The point is emphasized by several witnesses that the economic results of lessening the hours of labor vary with the occupation. In work of an artistic quality, for instance,

XLVIII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

the excellence of the product suffers if the hours are too many. In such work as that of a railroad engineer there is a limit to the length of time that a man can safely run a train.¹

Labor of women and children.—Much complaint is made of the employment of children, both in factories and in mercantile establishments. Such employment at a tender age is declared to be injurious to the children themselves; but the representatives of labor complain perhaps even more bitterly of the displacement of adults. Our present system, says Mr. Gompers, gives us busy children and idle men. The textile factories are the greatest offenders, but witnesses also refer to glass factories and shoe factories; and Mrs. Ames, the factory inspector of Massachusetts, regards work in mercantile establishments as harder, physically and mentally, and of less moral value in developing the children, than work in factories.

Legislation has done much to better conditions in the great industrial States. In New York, Massachusetts, and Illinois it is now forbidden to employ children under 14. In Pennsylvania the limit is 13. The chief factory inspectors of Massachusetts and of Pennsylvania do not think it necessary to fix a higher limit than now exists in their respective States. The Pennsylvania inspector adds that children often learn trades when young which they could not acquire so well when older. Several other witnesses, however, would be glad to see the age limit raised in all cases to 16. The extension of manual training in the schools is regarded as increasing the desirability of such legislation.²

Several witnesses mention the giving of less pay to women than to men for the same work. One holds that this is the worst economic feature of the employment of women, in that it drives the men to idleness or cuts their wages. In the two or three trades in which organizations have been strong enough to compel equal payment for equal work, as in the printing trade, he asserts, few women are employed. Employers generally prefer men, unless they can get women cheaper. Mrs. Ames, a factory inspector of Massachusetts, attributes the inequality of payment to lack of skill or lack of physical strength in women.³

Mr. Wright, United States Commissioner of Labor, denies that women are largely displacing men. They are rather, he says, displacing children. In some industries, such as the laundry business, men are displacing women. Mrs. Ames also calls attention to the displacement of women by men in laundries, bakeries, and hotels.⁴ Other witnesses take a different view. It is asserted that the competition of female clerks has driven down the wages of ordinary male salesmen to a pitiful level.⁵

A marked improvement in the last 20 years in the industrial condition of female workers in Massachusetts is noted by Mrs. Ames. Miss De Graffenried declares that the woman workers are much worse off in the great cities, such as New York, Philadelphia, and Boston, than in smaller places, because, though their wages may be higher, it costs far more to live.⁶

The employment of women in association with men in certain places, such as steel mills, is objected to on moral grounds. The general moral condition of female factory workers, however, is declared to be admirable. Though Mrs. Ames considers the work of women in stores harder, physically and mentally, than their work in factories, she does not give any credence to the notion that such employment tends to immorality.⁷

Machinery.—While there is a general agreement that improved machinery is capable of producing effects of general advantage to society, a considerable number of

⁶ Vol. VII: Ames, 59-61; De Graffenried, 218, 219.

⁷ Vol. VII: Ames, 57-59; Garland, 100; Schaffer, 389, 390.

witnesses, especially those directly representing labor, hold that under existing conditions the evil effects of it, if they do not overbalance the good, are at least very serious. It is declared that machinery has done nothing to lessen the hours of labor, and that the trades that have the shortest workday are those which are least affected by machinery. It is asserted that machinery tends to displace skilled workers by unskilled, and to increase the employment of women and children. Mr. Gompers, president of the American Federation of Labor, holds that unless the workers lessen their hours of labor and increase their consuming power there is a permanent displacement of labor by machinery, and for lack of consuming power plants have to close down. He agrees with other witnesses that the introduction of machinery does not in itself tend to lessen the hours of labor. Others refer to the specialization, which is required by present methods of production, as a great disadvantage to a workman who loses his place and has to seek a new one.¹

On the other hand, it is thought by some that machinery transfers labor from mere physical to more intellectual work, and, while giving employment to unskilled workers, turns hand labor to more artistic forms of production. It is declared, moreover, that improvements in machinery are made only as wages and the standard of living rise. Otherwise human labor is cheaper than machine labor.²

Mr. Brooks declares that the better labor unions do not oppose machinery. They know its advantages as well as the employer, but the manner in which it is introduced is of vital concern to them. In many industries the manufacturer can completely cripple the unions if he can introduce machinery without consulting them about the conditions. The lasting machine and other machines in the shoe trade have weakened the organization of the shoe operatives, which was one of the most powerful unions in New England. The president of the Iron Molders' Union says that his organization does not oppose the introduction of machines, but only asks that its members be employed on them and that wages be maintained. It advises its members to promote the development of the machine and to bring out its best possibilities. Foundrymen seem to prefer to teach unskilled laborers to operate machines instead of employing molders. Unskilled labor, being accustomed to work for less than the mechanic, will operate the machines for less.³

CONDITION OF LABOR IN THE SOUTH.

Cotton mills.—Several witnesses, chiefly employers, made general statements as to rates of wages and earnings in Southern cotton mills, usually those with which they are connected. The average earnings of spinners, as reported, range from 60 to 75 cents a day, and those of weavers usually from 90 cents to \$1.25; though one witness, an Atlanta manufacturer, estimates the average earnings of weavers in Georgia cotton mills at about \$4 a week, or 67 cents a day. The price of unskilled labor was given by one witness as 65 cents a day. Various witnesses, testifying as to the average earnings of all the employees in their mills, excluding superintendents and overseers, named sums ranging from 65 cents to 81½ cents a day. A majority ranged from 70 to 75 cents. The earnings of children are included in these averages. Attention was called in connection with these rates of wages to the low cost of living. It was stated that the ordinary price of chickens in South Carolina was from 12½ to 15 cents apiece; of eggs, 10 to 12 cents a dozen; of beef, 8 cents a pound; of bacon, about 6½ cents a pound. Fairly good board could be had, it was said, for from \$7 to \$8 per month. One employer, who considers it a material advantage to be able to work 66 hours a week, instead of 58, as in Massachusetts, declared that New England wages

¹ Vol. VII: Hayes, 111, 112; Gompers, 616, 618; Kennedy, 744, 748.

L INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

on the same class of goods are no more than his mill pays. Spinners, he asserted, get 10 cents a side, on an average, in New England, while his company pays 11 cents.¹

It appears from the testimony that all cotton-mill operatives, excepting in one or two mills, are white. Negroes are employed only for rough and unskilled labor. The commonest period of labor seems to be 66 hours a week, though it is longer in some cases, and perhaps in a few cases shorter. The cotton-mill workers come almost exclusively from the country districts, and it is declared that their wages, low as they may seem to be, constitute a distinct improvement over the incomes that they were able to make upon their little farms. Some employers say that a large proportion of them are saving money. It is admitted, however, that this is made possible only by putting the children of tender years at work. An organizer of the Federation of Labor states that while these people could do better in the mills than on the farms when cotton was low, they tended to drift back to the country when cotton went up. Mr. Candler, governor of Georgia, thinks that very few have succeeded in bettering their condition by changing from the farm to the mill.²

A more patriarchal relation seems to exist between the managers and the employees of the Southern mills than can now be found in New England. The sanitary conditions of the mills, however, are declared to be bad. Governor Candler thinks the mill operatives as a class are not as healthy as country people who work in the open air. This, however, is denied on the part of the employers.³

Hours of labor.—While hours in the Southern textile mills are 11 a day, or 66 a week, it appears that some of the strongly organized trades, such as the bricklayers and the stone masons, have succeeded in some Southern cities in getting an 8-hour day. Memphis has reduced the hours on municipal work to eight. On the other hand, it is testified that sawmills throughout the South work from sun to sun. This means never less than 11 hours, and in the summer 14 or 15 hours. The leased convicts work from sun to sun, and must get to the place of work before the sun is up, sometimes walking 5 miles. This means some 16 hours of actual work.⁴

Women and children.—The great majority of the employers who testified before the Commission declared that they did not wish to have any children under 12 years of age in their mills. It is pity for the children or for their parents, they protest, which leads to the hiring of small children. It would take a very hard-hearted man, one of them said, to resist in some cases. Mr. Tracy, State commissioner of labor of North Carolina and cashier of the Mechanics' Dime Savings Bank of Raleigh, testified that the number of child laborers under 12 had diminished more than half during the 3 years preceding his testimony, while the number of men had more than doubled and the number of women had increased 50 per cent.⁵

Representatives of labor, on the other hand, assert that men who seek employment are more apt to find it if they have a number of children who can be brought into the mills. One asserted that the mills would not have a family without employing the children. The children displace adults, and it is complained that fathers often refuse to do anything, and live on their children's earnings.⁶

As to the actual employment of children, it is not disputed that many go to work much before they are 12, and some witnesses give the age of beginning as low as 8 or even 6. Several employers state that they have a rule not to employ children under 12, but the most of them admit that the rule is sometimes broken. It is admitted by the opponents of child labor that the work is not laborious, but the confinement during long hours, in more or less dusty rooms, is believed to be detrimental

to health and physical development. One employer, however, declares that the boys of 13 who work in his mill look as robust and strong as other boys.¹

In connection with the employment of young children in mills, several witnesses refer to their early employment on the farms. Boys of 8, 10, and 12 years, it is said, plow, hoe, and pick cotton.²

No legal age limit for the employment of children in any Southern State is mentioned. Alabama had one, but abolished it some years ago. Many witnesses would approve of a law forbidding the employment of children younger than 12, and several would be glad to make the limit 14. Governor Candler would limit the employment of children under 14 to 6 months in the year. One witness thinks that a limit of 12 years in the South would be equivalent to one of 13½ or 14 years in the North, because of the earlier maturity. One cotton manufacturer considers that legislation on this subject should be uniform, and would be willing to introduce in the Southern mills the conditions which exist in New England.³

One or two witnesses state that mothers of families do not often work in factories, unless they are widows. One representative of labor, however, refers to the employment of mothers whose children are so young that it is necessary for them to leave the mill from time to time to nurse them. The employment of women, as well as that of children, is regarded as tending to diminish the employment of men and lower their wages. It is remarked, however, that even white women, and still more commonly colored women, work in the Southern fields as well as in the mills.⁴

*Company stores and tenements.*⁵—Several managers of Southern cotton mills testified that their companies had no stores and no tenements. In other cases, where company stores and tenements exist, it was maintained that the employees were under no compulsion to patronize the stores, or to live in the houses; though, in at least one case, it was admitted that they were asked to occupy the tenements, and that in dull times those who lived in company houses naturally had a preference in employment. It was said in some cases, by representatives of the labor interests, that the condition of the company tenements was very bad. Miss De Graffenried, of the United States Department of Labor, also stated that some of the older houses were very unsatisfactory; but she added that some of the newer ones were as good as the newer ones in some of the Northern textile towns, to which she had given high praise. Several employers named the rents charged by their companies. Among the rates mentioned were 42½ cents a room for 2 weeks, 50 cents a room a month, and \$2 a month for a 4-room house. The business manager of the Journal of Labor, of Atlanta, said that it was represented to him that the Exposition Cotton Mills, of Atlanta, charged their employees a rent of 75 cents a room a week. In some cases it was testified that country cotton mills furnished houses without any charge for rent.⁶

The same conflict of evidence with regard to the voluntary character of the transactions of employees with their employers' stores appears here as elsewhere. The employers state that all dealings are entirely voluntary, while it is declared on the labor side that there is a general understanding that the company store must be patronized.⁷

Labor organizations and strikes.—It appears from the testimony that labor organizations are very weak throughout the Southern States. The Federation of Labor, however, has several organizers there. It is making special efforts among the textile workers; but thus far, according to the testimony of employers, little progress seems to have been made. The railroad brotherhoods have some strength in the

LII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

South, and good organizations are said to exist in the printing and the iron and steel trades. Some cotton mills refuse to let their employees organize, but the general disposition of other employers toward organized labor is good.¹

Strikes have been very rare in the South. A representative of the Atlanta Federation of Trades thinks this may be due to the weakness of trade unions, though he believes that stronger organizations ultimately tend to check strikes. The absence of strikes may also be due, it is suggested, to the absence of foreign labor.²

Colored labor.—It appears that negroes do the common and half-skilled work in the iron, steel, and woodworking plants of the South. In the neighborhood of Birmingham they have learned the heavy grades of foundry work, and do the heavy work in the sawmills. They have not been introduced into the cotton mills, except for unskilled labor. Several attempts to use them as operatives have been made, but all have failed except one. As to the success of this one, which is still in operation, opinions differ. Objection is made on social grounds to the idea of employing white and colored hands together at the machines. This seems to be largely due to the presence of white women in the mills; for white men and negroes work side by side in other occupations, such as the building trades. The feeling is also expressed that the white mill workers ought to be saved from negro competition; that this field ought to be reserved for white labor, since no other field is. The competency of the negroes to manage the machines does not seem to be disputed, but their unreliability, their tendency to take holidays, to go on excursions, etc., is regarded as a serious obstacle to the employment of them.³

Several employers look to the negroes as a possible resource in the event of demands from the working people which they may regard as excessive. It is said that the negroes are faithful to their employers and have no tendency to strike, and that considerable sums of money have been spent in the effort to establish trade unions among them, with very small success. Even if they should be organized, it is said there is an abundance of field hands who could be brought in to take their places, and who, with their power of imitation, would in a few months satisfactorily fill the place of any strikers. Indeed, some employers think that, even aside from labor troubles, it will be necessary within a few years to bring negroes into the mills, for lack of enough white labor. At present the negroes have the advantage of the whites in that the white children have to go early into the cotton mills, while the negro children, being excluded, have actually superior opportunities for education.⁴

While any mixture of races is universally regarded with abhorrence by the Southern witnesses, attention is called to the advantage which the negroes derive from association with the whites. In the lower counties of South Carolina, where the negroes live by themselves, it is thought that they have deteriorated. Some witnesses testify to a general inferiority of the younger negroes to the older, which they attribute to lack of effective discipline. Some attempt to correct this lack is now being made by the public authorities. On the whole, witnesses seem to find an improvement in the condition and character of the negroes. Crime is said to have diminished among them, though it is still much more prevalent among them than among the whites.⁵

It is generally agreed, though not universally, that negroes get less wages than white men for the same work, executed with the same skill. It seems to be undisputed that the competition of the negroes, with their low standard of life, keeps down the wages of white men. The representatives of labor look to the organization of the negroes to raise the wages of both races. White men and negroes work side by side in the building trades and in many other occupations. The Southern railroads

employ negroes as firemen, but not in any other position where they compete with white labor.¹

It appears that colored men have been admitted to white labor organizations in some places in the Southern States. It is even asserted that they have been helped to join by being allowed to pay the initiation fees by installments. The general tendency is, however, to organize negroes separately. The white unions are trying to get the negroes into organizations in order that the wages of negroes may be raised, and that the white workers themselves may thus be protected in their own wages. In one case, however, it is asserted that the white men resisted the organization of a union of colored tobacco workers. Colored men are declared to make better union members than many foreigners.²

Different opinions are expressed as to the effect of prosperity upon the negro character. One witness, an employer, thinks the negro works more regularly and is a better citizen when he gets no more than a living. Another, a representative of labor, holds the opposite opinion. Two North Carolina witnesses refer to the increasing tendency of negroes to lay up money.³

The witnesses who refer to negro education agree in declaring that its effects are good and that there exists among the negroes a general desire for it. The proper education for colored people is believed to be such as is furnished by the Tuskegee Institute.⁴

Public education in the South.—Many witnesses from the Southern States protest that their States are doing all that they possibly can do for education, and in some cases as much in proportion to the assessed value of property as any other States. It is pointed out that almost all the taxes are paid by white persons, but that the school moneys are divided either in proportion to the attendance at the schools or in some other way which gives the colored people nearly an equal chance with the whites. Where cotton mills have been established the white children are even at a disadvantage, because many of them are put early into the mills, from which colored labor is excluded. Several of the States give public support to institutions for higher education, both literary and technical, for negroes as well as for whites. In the larger towns the school facilities are represented as good, and the length of the school year as comparable with that in the North. In the country districts, however, the schools are often open only 2½ or 3 months in the year.⁵

Miss De Graffenried, of the United States Department of Labor, states that the owners of textile mills in many places still continue the early practice of supporting schools for the children of their operatives. Several employers and others refer to the same practice. In some cases the companies contribute to the public-school fund, so that the schools may be kept open 10 months or more in the year. In other cases they establish schools of their own, either free or subject to a charge for tuition. Night schools have been tried in some cases, but they have not been very successful. Children who have worked 11 hours in a mill are not found in good condition for study.⁶

Several witnesses declare that the parents connected with the textile mills have little desire to send their children to school. The employers, in several cases, assert that they have to use the utmost pressure, both directly and through the agency of the teachers, to secure a satisfactory school attendance. Nearly all the witnesses who refer to the matter believe in some measure of compulsory education. One sug-

LIV INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

gestion is for a school running 12 months in the year, with a provision that each child shall attend not less than 3 months each year up to the age of 15. In this way each child could spend one-fourth of his time in school and three-fourths at work. The lack of a suitable compulsory-education law is felt to justify, in some degree, the employment of young children in the mills. It is asserted that if they were not there they would be worse employed.¹

South Carolina witnesses assert that illiteracy is decreasing in their State, and, in particular, that it is far less among children raised in the manufacturing villages than in the country districts. The school facilities in the villages are far better.²

Southern agriculture.—Several witnesses refer to the backward state of Southern agriculture, the lack of machinery, and the one-crop system. These evils are attributed by some to the fact that farming fell almost exclusively into the hands of ignorant negroes after the war. The crop-lien system has been one of the burdens upon Southern farming, and has kept the tenants in a condition closely resembling slavery. They have never been free from debt, and have been compelled to sell their crops as soon as they have been harvested. The system has also tended to prevent diversified farming, by turning all attention to the raising of cotton. It is declared, however, that all these evils are diminishing.³

IMMIGRATION.

Several witnesses call attention to the great preponderance of foreigners and children of foreigners in certain places and in certain occupations. Fully two-thirds of the textile-mill employees of New England are estimated to be of foreign birth. Three-fourths of the stonecutters in this country are said to have learned their trade in Europe. In some of the great factories at South Bend, Ind., like Studebaker's and the Singer sewing machine factory, probably eight-tenths of the workmen are foreign.⁴

Foreign oppression is spoken of as a chief cause of the immigration of the Jews, especially from Roumania and Russia. The efforts of the steamship companies, and their agents scattered through the regions from which immigrants come, are a potent and constant influence. Immigration rises and falls, however, with the rise and fall of industrial prosperity.⁵

The tendency of immigrants to settle in colonies, both in cities and farming districts, is regretted, because it retards assimilation and Americanization. Mr. Wyckoff thinks that this effect is even more pronounced in the country than in the city, because in the cities the conditions of employment bring different races together. Yet even in the country he admits that the actual process of assimilation seems to be very rapid.⁶

Mr. Blaustein, who regrets this tendency to colonization, at the same time deploras the loosening of moral convictions which results from separation from old ties and submersion in new communities, amid new surroundings and strange customs and morals. Mr. Reynolds, of the University Settlement, New York, notes the same tendency to moral degeneration. One phase of this phenomenon is the moral separation of parents and children. The parents, often unable to speak English, are at a disadvantage in the new community. The children, learning English in the schools, become interpreters for their parents, and soon feel themselves superior to them.⁷

This moral separation of children from parents is one of the great causes, in the

⁷ Vol. XIV: Blaustein, 115, 118, 119, 125; Reynolds, 82, 90-93.

opinion of Professor Commons, for the distinct moral inferiority of the native born children of immigrants. This class of persons shows a higher percentage of criminality than either the foreign born, or the native-born children of native parents. Professor Commons considers that the criminal tendencies of the foreign born are usually overestimated, in consequence of a fallacious treatment of statistics. Crime is a phenomenon of adults, and principally of male adults. Almost twice as large a proportion of the foreign born as of native Americans are of age. If, therefore, the proportion of crimes among foreign-born adults were as great as among native-born adults, the proportion of crimes to the total population would be nearly twice as great. Foreigners and children of foreigners contribute more largely to the minor crimes and misdemeanors—drunkenness, etc.—than to the serious crimes.¹

Mr. Blaustein declares that very few Jewish immigrants receive help from the public authorities or from the nonsectarian charities. For the most part, when they first arrive they are helped either by relatives or by people from their old homes. Such other help as they need comes from the United Hebrew Charities.²

The witnesses are almost unanimous in the opinion that immigration tends to lower the wages and the standard of living of American workmen. This effect is partly dependent upon the fact that immigrants have a lower standard of life than Americans, and are on this account willing to accept less wages. Two or three witnesses expressed the general opinion that immigration has little tendency to reduce wages, or, at least, little effect on skilled labor. Even one of these witnesses, however, adds that employers often bring in Canadian workmen when strikes occur, and that the proximity of the French Canadians to New England is especially convenient to manufacturers, because they come in busy years and return to Canada when the demand falls off.³

Contract labor.—The representatives of labor are unanimously of opinion that the importation of foreign workmen under contract is injurious to the American workers. They all complain, moreover, that the existing law against it is of relatively small effect, because of the difficulty of proving the existence of the contract.⁴

Several manufacturers, on the other hand, hold that the contract-labor law is a great injury to this country. By preventing the importation of skilled work people it is said to retard the development of industry here. The better class of workmen, who are able to make a living at home, hesitate to take the risks of moving. It is the less competent, therefore, that come to the United States. One manufacturer of worsted and woolen goods says that he advertised in the papers of Yorkshire, England, for capable mill people to come to his establishment in Pennsylvania, describing the town, the wages, and the cost of living, but did not receive a single application. It is declared that it is often impossible to get enough skilled work people in the United States; American young men will not take the time for thorough training; and the law could be safely amended so as to permit importation of skilled laborers under contract for the purpose of improving the processes of production in existing industries, as well as for establishing new industries. The latter exception already exists.⁵

Restriction of immigration.—Most of the witnesses who mention the restriction of immigration are representatives of labor, and such witnesses are practically unanimous in desiring the maintenance and the increase of the existing restrictions. Indeed, the present laws are considered of very slight effect. There is a marked difference of opinion, however, as to the methods of restriction which should be adopted.

LVI INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

Some would have a tax of \$25 or \$50 or \$100. Some would introduce an educational test. This is advocated by the secretary of the United Garment Workers, not merely as a means of restricting the number of immigrants, but also on the ground that the higher intelligence, which the educational test might be expected to insure, would enable the accepted immigrants to become quickly familiar with American conditions and standards of life, and to find their way into the better-paid industries and keep out of sweat shops. The educational test is opposed, however, by several representatives of labor as an apparent discrimination between working people. One would try to shut out all assisted immigration, whether assistance came from relatives in this country or from other sources. Investigation of the character of the immigrants by United States consuls or other agents before embarkation is suggested by several. The president of the Cigar Makers' Union would require every immigrant to present a trade-union card. Another witness would introduce some test of the ability of the immigrant to take care of himself without disastrous competition with American labor. One declares that the American Federation of Labor favors a law prohibiting immigration absolutely for 10 years.

Three or four witnesses, including at least one representative of labor, are opposed to any restriction whatever. A shoe laster, while admitting that immigration lowers wages, would give every man the same right to go where he likes which he desires for himself. One witness estimates that perhaps 10 per cent of organized laborers are opposed to the restriction of immigration. This minority think it unfair to shut out others from the advantages which they enjoy.¹

One or two witnesses desire the general enactment and enforcement of laws forbidding the employment of aliens on public works. It is admitted that the law of New York to this effect is continually violated.²

Mr. Reynolds and Mr. Woods, who are engaged in social settlement work, lay special stress upon the need of a deliberate policy directed to the education and assimilation of the immigrants. The foreign districts of the cities ought, says Mr. Reynolds, to have the best school buildings, the best equipped and the most skillful teachers, and the wisest and best officials in every department of administration. Our actual policy is the opposite. Mr. Woods thinks it especially important that the immigrants be held up to our American economic standards; and for this purpose he desires wise factory legislation, and all possible encouragement of the peaceful carrying out of the policy of the trade unions.³

AGENCIES FOR BETTERING SOCIAL CONDITIONS.

Witnesses interested in social settlement work and in other organized agencies for improving social conditions describe the methods of their several organizations in some detail. Mr. Reynolds speaks of the University Settlement Society of New York, the Provident Loan Association, and the Legal Aid Society; Mr. Woods, of the South End House, of Boston; and Mr. Blaustein, of the Educational Alliance of New York, whose work is primarily among the Jews. Mr. Woods also refers to the extensive municipal activities of Boston in providing public playgrounds, public baths, and public gymnasiums, and of the proposed institute for the mechanical and technical education of artisans and mechanics. Such work on the part of the city Mr. Woods believes to be an economy in the end, because it will result in saving in the police department, the prison department, the almshouse department, and the hospital department.⁴

⁴Vol. XIV: Potter, 8, 9; Reynolds, 78-82; Blaustein, 114-138; Woods, 196-203.

Several witnesses refer to the efforts of employers to better the condition of their workers. Fair and even liberal treatment, in respect to wages and conditions of labor, is declared by several employers to be the wisest business policy. With regard to any further efforts for employees, in the way of providing means of recreation, enjoyment, and instruction, Mr. Willoughby says that there is scarcely a large establishment in Europe which does not provide institutions of one kind or another for the benefit of its employees. He considers that one reason why this is so much less done in America is that the American workman does not like to have things done for him. What he wants he wants as a right. This was illustrated, Mr. Willoughby thinks, by the experience at Pullman. Mr. Nelson, however, manifests no consciousness of any difficulty from this cause at his model village of Leclaire. His experience there seems to have been altogether satisfactory. He indicates, however, that he has possibly interfered less with his workmen's freedom of action than some other employers under similar conditions.¹

Saving by workmen.—The encouragement of saving is mentioned by several witnesses as one of the most important means of bettering the condition of the workers. A glass manufacturer mentions the care which he has taken to educate his work people in economy and to encourage them to accumulate money. He believes that this education has been of the highest value to the technical progress of his men. To it he attributes, in a considerable degree, the fact that his goods have always commanded the highest price, and that more men have been advanced from that factory to positions of trust, both in it and in other factories, than from any other.²

Housing of the working class.—The problem of the housing of the poor is regarded as one of the most serious problems of the great cities. The chief reliance for meeting it seems to be placed on legislative measures. In a district of Boston, containing about 40,000 population, fully one-half the people live in apartments of from one to four rooms for each family; and in an investigation, made by the State bureau of statistics of labor about 1890, it was concluded that 25 per cent of the houses in the district were positively objectionable from a sanitary point of view. The restrictions upon the building of new houses in Massachusetts are now adequate and effectual, however, and in New York City also there has been a marked improvement in the condition of tenement houses, chiefly effected through legislation, during the last 10 or 15 years.³

Cooperation and profit sharing.—The testimony indicates that very few cooperative enterprises of any kind exist in the United States which have had a life long enough to test their chances of ultimate success. One or two cooperative stores are mentioned and are regarded as having gained an established place, and there is some reference to cooperative production in the glass and the iron trade. The success of these manufacturing enterprises seems, however, to be doubtful. Cooperative cigar factories are said to have been established in many instances by members of the Cigar Makers' Union. Some of them have failed, and when they have succeeded the tendency of the owners has been to join the ranks of the regular employers and work against the trade unions.⁴

A form of cooperation is referred to, which has developed in Great Britain, in France, and in New Zealand, and which consists in the temporary association of workmen for carrying on public works, constructing buildings, or furnishing supplies. The laws of France and of New Zealand make special provision for such associations of workmen. In France they are exempted from the necessity of giving bonds and from other formalities.⁵

The testimony shows that profit sharing has at times had a considerable extension

LVIII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

in the United States, but that a large portion of the concerns which have tried it have given it up. Mr. Nelson, a manufacturer, has followed the system in his own establishment since 1888, dividing the net profits, after allowing the commercial rate of interest on the capital, on the basis of an equal percentage on the wages of employees and on the capital of the company. Mr. Nelson does not believe that any employer ought to adopt the system in the expectation of making a profit by it. It ought not to be adopted on any other ground than that it is right to recognize the workers' interest in the joint outcome of the work. He lays down two conditions as necessary to the successful working of the system: That the plan of distribution be stated in advance, and be not left to the good will or caprice of the employer; and that no counter conditions be exacted.¹

Professor Gilman, an ardent advocate of the profit-sharing system, declares that nothing like a thorough trial of it has been made in a large proportion of the cases in which it has been introduced. The hostile attitude of the trade unions has sometimes compelled the abandonment of it. In other cases the advertising motive was too prominent in the adoption of it; and in others the employer made mistakes through ignorance of the experience of others.

Professor Gilman gives no weight to the idea that if the workmen share the profits they should also share the losses. He points out that the workmen make the same contribution to success in bad years as in good. They have no control over the commercial management of the business. If the commercial management is successful they receive the bonus they have earned; if not they lose it. It would not be wise or right to expect them, under such a system of industrial, not commercial, partnership, to lose more.²

Mr. Gompers, president of the American Federation of Labor, says that the history of profit-sharing enterprises leads him to look upon such propositions with great suspicion. Few such concerns, if any, have been even comparatively fair to their employees. They have made the workers work harder, for longer hours, and for less wages, than the employees of other concerns which make no benevolent pretenses.³

Mr. Willoughby thinks that the comparative ill success of both cooperation and profit sharing in the United States is due largely to the greater mobility of American than of European workmen; to their habitual movement from establishment to establishment and from place to place. The greater independence of American workmen also makes profit-sharing schemes less acceptable to them. It is a question, Mr. Willoughby thinks, whether it is desirable to limit the mobility or the independence of the laborer.⁴

EDUCATION.

The value of general education, both of the commoner and of the higher sort, is insisted on by several witnesses. A large part of the inborn genius of our people is in the 95 per cent of the children who do not get beyond the grammar school; and much of it is wasted for lack of opportunity. Education, by broadening a man's horizon, makes him able to see and to seize opportunities to which the untrained man is blind. It is declared that without fair school training a workingman can not become a first-class mechanic. Two or three managers of Southern cotton mills declare that children who have been to school make better operatives than those who have not been, and better citizens. A more thorough education is asserted to be valuable in the higher branches of industrial work. The principal of the School of Industrial Art, at Philadelphia, says that college men can avail themselves of the opportunities of his school more fully than anybody else.⁵

² Vol. XIV: Gilman, 362-370.

³ Vol. VII: Gompers, 644.

⁴ Vol. XIV: Willoughby, 178.

⁵ Vol. VII: Bridwell, 238; Tanner, 494; McAden, 504. Vol. XIV: Wyckoff, 185, 186; Woods, 202; Miller, 218-228.

Several witnesses express a desire for compulsory education, perhaps between the ages of 7 and 15. Free text-books are also advocated. Complaint is made that compulsory education laws have sometimes been enacted without providing school accommodations for all the children. Complaints of inadequate buildings come from Chicago, from New York, and from Philadelphia.¹

In some places night schools have become an important part of the public-school system. Those of Boston are open from September to March, and have 5,000 pupils. Both children and adults attend them.²

There is a general agreement that the public schools ought to turn their attention more in the direction of preparation for industrial employment. The eye and the hand ought to be trained as well as the brain. No effort ought to be made, it is thought, to give technical training in particular trades. The best results will be obtained by cultivation of the general powers. The principal of the School of Industrial Art, at Philadelphia, says that the changes needed are not in the direction of specialization, but rather away from the specialization that exists. Even the intellectual training now given in the schools ought to be modified by the introduction of industrial elements. The text-books of arithmetic, for instance, are almost wholly occupied with mercantile problems, calculations of profits, and brokerage. An arithmetic written on proper lines would introduce calculations of the speed of machinery, and other problems that would lead the student's mind in industrial directions quite as much as into purely mercantile questions.³

Most of the witnesses are of opinion that manual training is advantageous, both for its effect upon the mind and upon the moral nature and as a direct help in industrial work. Graduates of manual training schools are said to find employment more easily and to get better employment than others. This is perhaps not inconsistent with the opinion of the director of the New Bedford Textile School, that graduates of manual training schools, while somewhat better prepared to receive the higher instruction of his school than others, have not, perhaps, sufficient advantage to compensate for the 2 years which the manual training school may have cost them.⁴

Several witnesses advocate the supplementing of the general training of the ordinary schools with special trade schools, which some think ought also to be supported by the state. The work of such schools seems to divide itself naturally into at least two branches; one for the training of mechanics and operatives, the other for the training of superintendents, designers, and the like. Experience seems to show that the former work should be carried on largely by means of night schools, and that the students will be in great part persons already occupied in the trades. Doubtless there is room, however, for day schools giving preliminary training, which would be of value to those who were to become skilled workmen, and which might well be taken before actual shop work should begin. This seems to be the method of the New York trade schools; and the experience of technical schools, especially in the textile industry, in France, Germany, and England, seems to confirm its value. Several witnesses attribute the enormous industrial advance of Germany in a great degree to her means of industrial education, and credit the superiority of French skilled labor in certain departments to the same cause.⁵

The general secretary of the National Brotherhood of Electrical Workers does not consider that a knowledge of the principles of electrical science, such as is possessed by the graduate of scientific technical schools, is of very great advantage in the mechanical work of his trade. His opinion may possibly be influenced by the feeling that persons so trained do not readily coalesce with the remainder of the workers. This feeling is indicated by the remark that they are especially feared in case of strikes.⁶

LX INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

The higher industrial training, in its actual methods, is described by the principal officers of the School of Industrial Art, at Philadelphia, and of the New Bedford Textile School. Both these schools try to give a thorough training in designing, mechanical drawing, and engineering. The Philadelphia school devotes much attention to textile work, but includes other branches of production as well. The New Bedford school is purely textile.¹

But little attention is given by the witnesses to instruction through apprenticeship, such as was formerly relied on in all trades. One manufacturer refers to the difficulty of retaining apprentices after they have gained a certain amount of skill, such that they can pass for journeymen. The Midvale Steel Company, however, still keeps a small number of indentured apprentices and gives special care to the training of them. It supplements training in the shop with evening instruction in a branch of the Franklin Institute near the works. The boys are compelled to attend the institute, and the company not only pays their tuition but pays them for their time in the school at the same rates as for their time in the shop. The purpose of the company is to train these boys to become inspectors and foremen, and the policy is found successful.²

LABOR LEGISLATION.

Factory legislation.—Several witnesses, factory inspectors and others, speak of the condition and results of factory legislation and inspection in the several States. The chief value of it is considered to be in compelling unscrupulous employers to do what others are willing to do. This helps the fair employer, by making the conditions of competition equal. The employment of suitable factory inspectors is also valuable in calling the attention of well-meaning employers to reforms which they are quite willing to make, but which would not occur to them, and in keeping a check upon ignorant foremen and superintendents.

The factory laws of Great Britain, where factory legislation was first enacted, are admitted to be the models for the whole world. The obstacles which had to be overcome there were greater than any that ever existed in the United States. The laws of Massachusetts are regarded as the best in this country, though they might be improved by adopting some features of the present English statutes. Massachusetts seems also to be the only State which provides a sufficient number of inspectors to secure the effective enforcement of the law. Massachusetts has 36 inspectors; New York has 38, and this number is declared by Miss De Graffenried to be not half enough for New York City alone. In New Jersey, Pennsylvania, Illinois, and Ohio also, it is said, the number of inspectors is insufficient.

Bakeries have of late been a special subject of factory legislation, and great sanitary improvements have been effected in them. In New York, in Pennsylvania, and in Chicago, it is said, most unsatisfactory conditions have been replaced, through the workings of the law, with conditions which are at least tolerable.

The factory inspector of New York also calls special attention to the good effects of mining inspection in his State, particularly in the diminution of accidents.³

As illustrative of the importance of labor legislation and of strong unions, it is asserted that men who have conducted textile mills under proper sanitary and other conditions in Massachusetts, have acted very differently after moving their mills to Georgia. Many witnesses regret the embarrassment of the more advanced States in competition with States in which working hours are more and employment conditions worse. A considerable desire for national laws limiting the hours of labor and prescribing other conditions of work is manifested. Miss De Graffenried regards the lack of uniformity of factory legislation as one of the disadvantages under which we

¹ Vol. VII: Miller, 218-229; Brooks, 552-554.

² Vol. XIV: Creason, 270; Harrah, 361, 382.

³ Vol. VII: O'Leary, 38-42; Ames, 62, 63; Wade, 68-77; De Graffenried, 227-232.

labor as compared with European countries; but Mr. Wright, United States Commissioner of Labor, declares that there has probably never been an instance of the removal of capital from one State to another on account of restrictive laws. The transfer of textile manufactures to the South is due to the proximity of raw materials. Most Southern factory owners still retain their New England factories.¹

*Company stores and tenements—Cash payments.*²—The ownership of stores and tenement houses by industrial and mining establishments is a source of almost universal complaint. It is admitted that such stores might be made valuable to the employees if they were run for that purpose, and if they supplied goods at cost with the addition of a moderate charge for handling. It is pointed out, however, that this would need an extraordinarily conscientious employer. The temptation is to compel employees to trade at the company stores, and to make extraordinary profits on the sales. As a matter of fact it is declared that people who buy at company stores could always buy from 10 to 50 per cent cheaper at other places. The compulsion is not necessarily open and acknowledged, but employees observe, or think they observe, that those who do not trade much at the company stores are discriminated against in the matter of employment. The result of the system is that workmen are kept continually in debt to the stores, and never receive any considerable amount of wages in money; and in times of strike the stores become instruments for compelling submission by threat of stopping credit.³

An exactly similar complaint is made regarding company tenements. These houses are said to be often of the most inferior character, and to be rented at exorbitant rates. One witness asserts that he has been discharged for refusing to pay \$12 a month for a company house, which he did not need, being unmarried. Mr. Wright, United States Commissioner of Labor, cites an instance in which an employee was forced to rent a company tenement house, though he was living in his own house. The company-owned houses of Pullman are said, by Miss Kelley, former factory inspector of Illinois, to have been a source of continual complaint. In some cases, however, as in some New England factory towns, company houses are said to be better, and the rents relatively lower, than those of other owners.⁴

Laws forbidding company stores are desired by some witnesses, though it is pointed out that laws against them have often proved ineffective. In some cases this has been due to the need of individual complaints, and to the fear of losing employment, which keeps the workmen from complaining. Factory inspectors, it is said, should be required to enforce such a law.

The desire is also expressed that payment be required to be made in cash and at short intervals, either weekly or semimonthly. A requirement of cash payment, if enforced, would diminish the power of the company stores. For all these evils, some witnesses, while desiring legislative regulations, place their chief dependence upon the direct action of trade unions. The weekly-payment law of Massachusetts is highly praised, however, by those who have had experience under it.⁵

Convict labor.—There is a general complaint of the competition of convict-made goods with the products of free labor. The occurrence of the trouble is mentioned in the manufacture of clothing, of boots and shoes, of harness, of stoves, of hosiery, and of plumbing supplies, and in the mining industry. One witness suggests that the total product of prison labor is not sufficient to greatly affect the market; but it is replied that the evil depends not on the supplying of a large part of the market, but on the fixing of a cut price, which other manufacturers, employing free labor, find

LXII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

themselves compelled to meet. One or two manufacturers in the lines of clothing and of boots and shoes declare that they do not feel the competition of prison-made goods; but they attribute their exemption to the fact that they make better goods than can be produced in prison, or that they depend for their market upon the union label, and upon appeals to the sentimental dislike of prison-made goods, and to the feeling in favor of firms that are regarded as fair.

Nearly all the witnesses agree that it is necessary to keep the convicts employed, for their own good as well as for the good of the taxpayers. One or two witnesses hold that so far as the taxes are concerned workmen and mechanics could well afford to support the convicts in idleness rather than permit the competition of convict labor. In general, however, it is not suggested that the industrial employment of the convicts be stopped. It is proposed by many witnesses that all machinery, unless such as is driven by the hand or the foot, be removed from the prisons. This is advocated both for the diminution of the prison product and the consequent lessening of the competition with free labor, and also on the ground that hand work would give the convicts a better industrial education. It is maintained that they ought to be given a general training, each in some trade. This would be better for them, and so ultimately better for the State, than to employ them at machine work of small educational value.

One of two methods has usually been adopted for the employment of prisoners. Often their labor has been sold to private individuals, under lease or contract, at fixed piece prices or at fixed rates per day. In other cases industries have been carried on for State account, under the direct management of State officers, and the products have been sold in the general market. Both methods are regarded as having almost equally bad effects upon the wages of free labor. Both also give opportunities for corruption, which are removed when neither the labor of the convicts nor the products of their labor are subjects of sale.

Most proposals for the removal of convict competition look to the entire stoppage of the sale of convict-made goods in the market. Some propose that the convicts be employed in the making of roads and other public works. Others advocate the plan which is now adopted in New York, under which a variety of manufactures is carried on in prisons, but only manufactured for the use of the State and its political divisions. Goods for the use of the prisons and the prisoners themselves, for the State insane asylums, for the public schools, and other institutions of local government are obtained from the prisons, but no prison products are put upon the market. It is admitted that this system lessens the employment of free labor, as any economic employment of the prisoners must; but the great evil—the cutting of prices by competitors whose expenses are partly paid by the taxpayers of the State—is done away with.

So long as convict-made goods are offered in the market it is desired that buyers be enabled to choose them or to refuse them by being informed when they are offered. To this end it is desired that such goods be branded or marked to show their origin. The law of New York requiring convict-made goods from other States to be so branded has been declared unconstitutional on the ground that it is an interference with interstate commerce. To enable every State to deal with this question in such way as it deems wise, several witnesses advocate a national law prohibiting or severely taxing interstate commerce in prison-made goods, or providing for the branding of such goods, or giving the several States full power over them when offered for sale within their borders, notwithstanding their origin in other States.¹

Labor in public employment.—A general disposition appears on the part of workingmen to demand that public employment be paid somewhat more highly and that the hours in it be somewhat shorter than the pay and the hours in private work. All

¹Vol. VII: McNelli, 123, 124; McDonough, 238-300-302; Eaton, 373; Myers, 568, 569; Kruger, 562, 568; Carhartt, 664-671; Tilt, 678, 679, Fry, 906.

workers, it is said, ought to have a wage sufficient for their decent support, and it is the duty of society as a whole, acting through governmental agencies, to be even generous in its conduct toward its employees and to set a good example to private employers. There is also a belief that an increase of the attractiveness of public work will tend directly, by competitive influences, to raise the wages in all similar employments. The employers who refer to the question do not think that more ought to be paid for public work than is paid by private employers for similar service.

Connected with this question is that of contract work or day work on public undertakings. The representatives of labor desire the abolition of all contracts. They declare that competition compels contractors to use poor materials and to cut wages; in consequence, contract work is always inferior and costs more in the long run than day work. The contract system is declared to lead to corruption in politics and extravagance in expenditure. The London county council and our own Post-Office Department are pointed to as examples of highly successful use of the system of direct employment, as well as various city waterworks and other enterprises of similar character. The city of Memphis has abolished contract work and adopted the 8-hour day for all city employment. It is testified that more work is accomplished in 8 hours than was formerly done in 10.¹

The representatives of labor organizations and some other witnesses desire that a preference be given to union labor in all public work, such as the construction of buildings and the manufacture of clothing for the Army.²

A modification of the contract system is advocated, on behalf of employers in some particular trades, by which the custom of letting contracts for the whole of public buildings to general contractors should be exchanged for the letting of separate contracts for each particular part, as, for instance, the bricklaying and the heating apparatus to contractors in those special lines. It is declared that such a method would make a better supervision possible over those who actually perform the work, and would secure a better quality of work, at lower cost.³

Employers' liability and workmen's insurance.—Several witnesses refer to the desirability of changes in the law of employers' liability. The courts, says Mr. Hourwich, have gone further and further from the sound principles of the common law. "There is no employers' liability under any circumstances under the present laws of the State of New York, as construed by the courts." Legislative modification of existing laws is especially needed with regard to the doctrine of contributory negligence and the doctrine that a workman can not recover damages from his employer for injuries due to the fault of a fellow-workman. The fellow-workman idea has been pushed so far that in New York a foreman and a general superintendent have been held to be fellow-workmen.⁴

The president of the Builders' League of New York City, on the other hand, protests against such an enlargement of employers' liability as came near enactment in New York in 1900. He declares that under existing conditions of labor organization the employer is not responsible for putting unfit men in such positions that they endanger the lives of others. The union is responsible for it; yet by the proposed modification of the fellow-servant doctrine the employer would be liable for any resulting damage.⁵

Mr. McMackin, commissioner of labor statistics of New York, notes that the fellow-servant doctrine, established in the English courts in 1837, and followed as a precedent in the United States as well as in England, has already been modified by statute in England and in several of our States, and in some other States by court decisions.

⁵ Vol. XIV: Leo, 97, 100, 101.

LXIV INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

Mr. McMackin holds, however, that even the entire abolition of the doctrine of common employment would not make the employer's liability an entirely adequate resource for the injured workman. This is shown, he considers, by the experience of England. The trouble is that in so large a proportion of accidents it is impossible to fix the blame. A German investigation of some 16,000 accidents, in 1887, showed that about one-fourth were due to the fault of the injured, that only a little more than a fourth could be traced, even in part, to the fault of any other person, and that in nearly half the cases no personal fault could be assigned.

Mr. Willoughby, of the United States Department of Labor, and Mr. McMackin give somewhat extended accounts of the system of workmen's compensation, which has been substituted for the older form of employers' liability in all the industrial countries of Europe except Belgium. The first law of this character was passed by Germany in 1884. The German system is one of compulsory insurance, the cost of which is borne by the employers. Under the system adopted by Great Britain, the employer is free to insure against risk or to bear it himself. The scheme covers practically all the industrial employments, including agriculture. It provides compensation for all accidents to workmen which occur in connection with their employment, except that in England those due to the serious and willful misconduct of the injured person are not covered. Under the German law every injured employee can claim, for every week of total disablement after the fourteenth, two-thirds of his regular wages, and the family of a workman killed in a factory can claim a pension of 60 per cent of his regular wages.

The business of insuring against liability for accidents to employees has attained great volume in this country. Ten companies had over \$350,000,000 of this class of insurance in force in 1894, and over \$725,000,000 in 1898. In the five years, 1894 to 1898, these 10 companies received \$19,400,000 for insurance and paid out less than \$9,400,000 for losses. That is, less than half the amounts paid by the employers reached the injured workmen. Under the German system the workmen get 82 per cent of the total expenditures. It is true that the direct cost to the employers is less under our system than under the German; but many American firms pay half or full wages to injured employees, in addition to their insurance premiums; and in any case the cost of the German system is far less in proportion to the benefit.¹

Influence of labor organizations.—Two or three employers complain of the excessive influence, as they think, which the labor interest is able to exert on legislation and of the methods which it employs. Legislators who fail to support labor measures are blacklisted, and the labor organizations insist on the exact following of the lines they have laid down, without any allowance for honest differences of opinion among persons well disposed toward them. The maintenance of labor lobbies, as at Albany, is also criticised.²

Labor councils.—Professor Commons suggests the establishment of labor councils, containing an equal representation of capitalists and laborers, for the purpose of framing conclusions and recommending legislation on the basis of such investigations as those of the United States Department of Labor, together with all other available information. Such councils exist in France, Belgium, and Austria, and in some cases they have had a considerable influence on legislation. Mr. Willoughby considers that, because of the comparative lack of organization among the workmen of continental Europe, and because the press gives far less opportunity than that of Great Britain or the United States for developing or expressing public opinion, there is a field for such councils in those countries which does not exist here.³

LABOR ORGANIZATIONS.

Membership and growth.—The testimony shows clearly that industrial prosperity is favorable to the growth of labor organizations. From 1892 to 1897 the membership of those in New York State decreased 100,000. From March 31, 1897, to June 30, 1900, a comparatively prosperous time, there was an increase of more than a hundred thousand. The growth is said to have been chiefly outside the city of New York. The city has been for some time pretty thoroughly organized. The commissioner of labor statistics of New York, testifying in September, 1900, thought that the organizations included 75 per cent of the workers at mechanical trades in the State, and perhaps one-eighth of all wage earners. Of Indiana it was stated in May, 1900, that the unions were stronger than 5 years earlier, but not quite as strong as 10 years earlier. The old unions maintained their wages and hours and their organization through the hard times; but the new organizations lost members, and many disappeared.¹

One witness states that some of the strongest and most successful unions have been composed of unskilled workers. The chairman of the board of mediation and arbitration of New York says that most unions of the unskilled in that State are connected with public and municipal works. The organization of farm laborers is referred to by Mr. Gompers as having made very slight progress, though he has high hopes for it.²

Mr. Gompers refers to the attitude which most of the unions have assumed toward negro labor, demanding that colored and white workmen have equal pay, and in many cases giving equal recognition in the unions to both races. The American Federation of Labor has refused to permit the color line to be drawn in the constitution or the laws of affiliated organizations, and its convention once refused a banquet, in Birmingham, Ala., because 3 colored delegates were not included in the invitation. Even in the South many labor unions have taken in colored men as well as white. Where this is not done the white men help the negroes to organize separately.³

Advantages and disadvantages of unionism.—Several representatives of the unions assert that the wages of the workmen have been increased and their hours have been shortened by the organizations. When hard times come, it is said, the unorganized suffer reductions of wages, but the strong unions are able to maintain their position. This is confirmed by the manager of the Fair department store, in Chicago. Men who receive \$3.50 or \$4 a day, he says, might be reduced by competition to \$1.50 when hard times came on; but the unions are able to maintain wages at \$4, and there are just as many days' work to be had at \$4 as there would be at \$1.50. Mr. Wright, United States Commissioner of Labor, says that wages in the printing offices have been maintained, despite the business depression since 1893, partly, at least, through the strength of the union.

It is maintained on the part of the unions that though union men get higher wages in many cases than nonunion men, nonunion employers can not go too far below the union price, and in consequence even a nonunion workman shares the benefits of the union. The secretary of the master builders' association of Boston confirms this view, saying that the minimum union rate of wages prevails among Boston builders, even with employers who hire nonunion men.⁴

Professor Commons says that experience shows, both in London and in this country, that in times of depression practically no union man applies for relief from the public authorities. They are cared for one way or another by their unions. Mr.

LXVI INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

Hourwich also states that he examined the data with regard to many thousands of unemployed workmen in Chicago during the industrial crisis of 1893, and found very few members of labor organizations among the applicants for charitable relief. Whether this was because there was less unemployment among organized workers, or because they were better paid and could stand unemployment longer, or because they were aided by their organizations, he does not pretend to say.¹

It is asserted also that the unions exert a favorable influence upon general business conditions by increasing wages, and so enabling the masses to consume more goods. The main cause of industrial depression is underconsumption, due to the small pay of the working class. The tendency of the unions, therefore, is to check such depression.²

It is further maintained that the unions exert a beneficial influence upon the intellectual and moral condition of their members. Discussions of economic and social subjects lead the members to read and to think, and make them better citizens.

The secretary of the National Association of Builders speaks in high terms of the intelligence of the representatives of labor organizations with whom he has come in contact in his business and in his official work. It is also asserted that the unions encourage steadiness and sobriety, though the president of the National Glass Company thinks that union men are more apt to be led into vice and intemperance through social clubs. He asserts that more men from the manufacturing departments of his factory, which ran nonunion for 25 years, went into other factories as managers and superintendents than from all other similar factories in the United States put together.³

One or two witnesses speak with great bitterness of the general character and effect of the unions. One holds that they tend to the disruption and disorganization of society, and that they are "the greatest menace to this Government that exists." One workingman also complains of the arrogance of the unions, which include not more than one-sixth of the working class, in pretending to fix conditions of labor for the other five-sixths, and in reviling as traitors and scabs those who claim the right to make their own bargains.⁴

The representatives of the unions, on the other hand, declare that the single wage-earner, acting alone, has no liberty of contract in dealing with an employer. Liberty only becomes possible for the wage-earner through combination. The union is to the laborer what a republican form of government is to the citizen—it gives him freedom. In it he joins with other workmen in determining the policy of the trade by a majority vote. Without it he has to submit to the dictation of an employer.⁵

Witnesses representing the employing class differ as to the effects of labor organizations upon the interests of employers. The president of the Midvale Steel Company, while he does not himself deal with labor organizations, thinks it would be of decided advantage if, by union action, wages were made uniform in all competing plants. It would give certainty and stability to business operations. Mr. Carhartt, a clothing manufacturer, took some trouble to get his employees organized and has found his dealings with the organization eminently satisfactory. If an employee thinks he is illtreated, he complains to the grievance committee of the union, and in most cases the grievance committee satisfies itself that the firm has acted justly. Often such complaints are not even presented to the firm. Other witnesses, however, think that the unions give the workmen an evil education, teaching them that the employers are unjust to them and get an undue proportion of the product, and that capital is their enemy. The town of Birmingham, Ala., is mentioned as a place

¹ Vol. XIV: Commons, 39; Hourwich, 167.

² Vol. VII: Perkins, 173.

³ Vol. VII: Lacy, 499, 500; Garrett, 548; Thompson, 718; Sayward, 852; Frey, 898, 899.

⁴ Vol. VII: Russell, 336, 337; Thompson, 756, 757, 759, 772.

⁵ Vol. VII: McNeill, 114-118; Perkins, 173-177.

where the labor organizations are strong and where, by their demands for high wages, they constitute a serious menace to the prosperity of the city.¹

One particular complaint against the unions is that they stir up strife between the men and their employers and cause strikes. It is admitted on behalf of the unions that when a union is first formed it is likely to have many strikes. The newly organized men have an exaggerated idea of the power of the union; and, on the other hand, employers who have not been accustomed to dealing with unions resent the assumption of the men to appear by committee and imagine that it is an attack on their rights. Both parties become wiser by experience, and it is asserted that when an organization has become thoroughly established it diminishes rather than increases strikes. For two years, it is said, an accurate record has been kept of strikes in Indiana, and more than half of them have been strikes of unorganized men. The labor commissioner of Indiana thinks that 80 per cent of labor troubles in that State are "with unorganized workmen, or men newly organized, not disciplined along the line of organization." Organization, it is said, exerts an educational influence and leads to more careful and deliberate consideration of points in dispute, both on the side of the men and on the side of the employers.²

Nonunion men.—Special complaint is made by some employers and by one representative of nonunion labor of the policy of the unions in trying to exclude nonunion men from employment by refusing to work with them, and, in the case of public work, by influencing legislative and executive action. This policy is declared to be tyrannical and an interference with the rights of nonunion men. It is even alleged that the real purpose of the organization is to gain an advantage for the insiders over the outsiders. On the other hand, it is declared that no such advantage can be sought, since the unions welcome every man of good character to membership, and since, indeed, they constantly give their efforts and contribute large amounts of money to bring in the unorganized. The purpose of the policy in question is not to exclude the nonunion men from employment, but to induce them to become union men. It is alleged to be a necessary policy for the attainment of the purposes of the organization. In order to meet the employers on equal terms the union must be able to meet them as the representative of all his workmen or of the whole of that class of workmen of which it is composed. If it represents only half the force, so that the other half are not bound by its action, its action will be of relatively slight importance to the employer. The union can better afford, it is argued, to concede a reduction in the rate of wages than to waive this fundamental demand for unionization of all labor.³

Apprenticeship.—Trade-union regulations of apprenticeship are defended on the ground that some employers engage boys, not for the purpose of teaching them a trade, but to supplant men and to cut wages. Under such a system, it is declared, the boys work and the men walk the streets for lack of work to do. The boys are not taught trades at all in such cases, but are kept upon narrow lines of work, such as bring the greatest immediate profit to the employer. The regulations of the union are meant to secure for every boy who goes into a shop an opportunity to acquire a real knowledge of the trade. They are designed to protect mature men in their employment, and also to protect the boys, first from premature transference from school to industrial work, and, second, from exploitation, when they should receive instruction in their future occupations.⁴

Officers and leaders.—The opponents of the unions attribute the greater part of their supposed evil influence to the machinations of demagogues. Business agents or

LXVIII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS

walking delegates are thought to be agitators, who are too lazy to work and who wish to live upon the work of others. They are alleged to be arbitrary and unjust in their methods, not only toward employers, but even toward their own members.

On behalf of the unions it is asserted that the business agent is not usually a leader of the union in the sense of determining its policy. He is a servant of it, whose duty it is to force payment of dues, to bring nonunion men into the organization, and in case of trouble to reach a settlement, if possible, by peaceful means. It is pointed out by Bishop Potter, as well as by representatives of the unions, that it is necessary to employ business agents in dealing with employers, because if a committee of the employer's own men are sent to him with any demand, whether or not the demand is granted, the employer is likely to remember the committeemen with dislike and to take the first opportunity to get rid of them.

Mr. Walcott, ex-chairman of the Massachusetts board of conciliation and arbitration, doubts the justification of the feeling which many employers have that their employees ought not to ask them to receive an outside party as the representative of the men in business dealings. Mr. Walcott suggests that if anybody had a claim against the manufacturer it would be presented through some attorney, and the manufacturer would discuss it purely as a matter of business, without any reference to the attorney's personality.¹

Attitude of employers.—Several witnesses agree in stating that the attitude of employers toward the unions is, on the whole, growing more favorable. Mr. Wright, United States Commissioner of Labor, says that employers are glad to have the cooperation of unions if they are directed by men of business experience and integrity, as the typographical union and the glass blowers' unions are.

Yet it is pointed out that the favorable change of attitude does not appear everywhere.²

Mr. Brooks declares that the growth of socialism in such New England towns as Brockton and Haverhill results from the feeling of the workingmen that their trade organizations can effect nothing. If manufacturers want to make socialists in this country they have only to "smash the unions."³

Union labels.—It appears that the first union label was adopted by the Cigar Makers' International Union in 1880. Up to November, 1899, 37 national and international unions had adopted labels, which were recognized by the Federation of Labor. The Knights of Labor also have various labels not included in this number. The purpose of the label is to guarantee to the purchaser that the labeled goods have been made under conditions approved by organized labor. The employees are all members of the union. The label is supposed to guarantee better sanitary conditions than are usual in the trade. The wages are usually higher and the hours of labor are usually shorter than in the same trade where the men are unorganized.

A manufacturer of workingmen's clothing, who uses the label of the United Garment Workers, regards the label as a means by which organized workers help those manufacturers who desire to pay their employees high wages and to give them good surroundings.

Those unions whose labels have become valuable, like the cigar makers, have suffered greatly from counterfeiting. The United States laws give them no protection, because a trade-mark can not be defended unless the owner of it is also the owner of the goods it is applied to. Many States, however, have enacted special laws for the protection of union labels.⁴

The incorporation of trade unions.—The testimony seems to indicate that only a very small proportion of the trade unions of the United States are incorporated, though

¹ Vol. VII: Tilt, 682, 683; Gompers, 609; Coffin, 777, 786, 787; Fry, 899; Walcott, 918-915. Vol. XVI: Potter, 4; Leo, 96-99; Steinbliss, 23.

² Vol. VII: Wright, 16. Vol. XIV: McCormack, 59, 60; Fox, 149; O'Brien, 431.

³ Vol. XIV: Brooks, 140-142.

⁴ Vol. VII: Gompers, 628-630; Shonfarber, 430, 431; Carhartt, 659-661.

the commissioner of labor statistics of New York presented a list of some 300 incorporated unions out of a total of 1,600 unions existing in the State. A marked difference of opinion exists between the witnesses as to the advisability of incorporation. Several witnesses, both representatives of labor organizations and others, think that incorporation would be advisable, because it would enable the unions to enforce their contracts with employers and others, and because their increased responsibility would make employers more disposed to deal with them. The president of the Cigar Makers' International Union adds that they can now be brought into court and held responsible almost as effectively as if they were incorporated. The president of the Brotherhood of Electrical Workers thinks that incorporation would be desirable, providing compulsory arbitration were also established. Mr. Lusk, a former member of the New Zealand parliament, says that the experience of New Zealand unions with incorporation has been exceedingly favorable; but it is there connected with a compulsory arbitration law.¹

Several representatives of the unions are strongly opposed to incorporation. The alleged tendency of the courts to favor employers and to oppose the unions is repeatedly mentioned. Mr. Gompers prefers to keep the union funds safe from the interference of the State, and does not think there would be any gain in giving legal validity to contracts between employers and unions. A union which does not keep faith can not succeed; but many of the labor disputes arise from the breaking of contracts by employers, and the legalization of the contracts would be of little help, because employers can readily find ways of evasion. The contracts of employers with workmen can be enforced only through the power of the workmen to make evasion more expensive than compliance. This power—that is, the power of the unions as fighting bodies—would be weakened by incorporation. In time of strike the funds of the union might be tied up by injunction through the act either of the employers or of a dissenting minority of the members. The possibility of a successful contest would be destroyed even if the position of the union were ultimately sustained by the courts.²

Mr. Hourwich, an attorney, points out that the incorporation of labor organizations under the existing law would not essentially increase their legal powers. An unincorporated labor organization in New York may make contracts and incur civil liability, and may bring civil suit, for instance, against a defaulting treasurer just as any other private firm might. It might even acquire title to real estate, and this need not necessarily be done through trustees; that would depend upon its own rules and regulations. On the other hand, even if the union were incorporated, it could not collect damages from an employer for breach of a contract relating to the employment of its members. Each member might be able to collect damages by a separate suit, but the union would be, in the eye of the law, a separate entity, which would have made no profit by the carrying out of its contract, and hence could show no damage by the breach of it. Mr. Hourwich holds that there should be a special law for the incorporation of trade unions, allowing them to make labor contracts on behalf of their members, and if the contracts were broken to collect the damages which the members might suffer as a society or as individuals.

Mr. Hourwich believes, however, that the opposition of many trade unions to incorporation is due to lack of familiarity with the advantages which could be derived from the protection of the law, though some of it arises from the belief that the law has in most cases favored the employers' side.³

Knights of Labor and American Federation of Labor.—Representatives of the Knights of Labor and of the American Federation of Labor give some account of these bodies and discuss the differences between them. The American Federation of Labor is based

¹ Vol. VII: Spohn, 142, 154; Sherman, 378, 381; Schaffer, 387, 388; McMackin, 823-827; Lusk, 886. Vol. XIV: Leake, 278, 279.

³ Vol. XIV: Hourwich, 143, 152, 155-160.

LXX INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

on the control of each trade by a union of the trade. All local unions, so far as possible, are organized into national trade unions, and so far as this is done the local unions have no direct relation to the Federation. The per capita tax by which the expenses of the Federation are covered is paid by the national bodies. Any body can secede at any time. Except in the absence of coercion, the relation of the national bodies to the Federation is similar to that of the States to the Federal Government.

The primary idea of the Knights of Labor is that of the union of all workers. Each local assembly has a direct relation to the central body. The several trades are allowed to control their own affairs, and neither the general executive board nor the district executive board has a right to interfere in a trade dispute unless asked to do so. Yet the feeling of the body, as expressed by Mr. Schonfarber, is favorable to a general participation in the settlement of the affairs of each trade. Mr. Schonfarber believes that mixed organizations, including members of different trades, are, on the whole, more successful in dealing with trade disputes. Men affiliated only by ties of organization with those actually engaged in disputes have done the most effective work in support of them, and, on the other hand, the members of a mixed organization represent more points of view and are better able to give fair consideration to both sides of a case, and so are likely to be more conservative in dealing with employers. While Mr. Schonfarber admits that there is a tendency toward keeping trade matters under the control of each trade, he attributes this largely to the fact that employers prefer to deal with trade organizations rather than with a mixed body, because the mixed body is the stronger.¹

The American Federation of Labor itself has organized mixed local bodies, composed of members of various crafts, under the name of federal labor unions. These are only meant, however, to bring together wage-workers whose own trades have no unions in the place. It is the design to organize trade unions from the members as fast as enough representatives of the several trades are gathered.²

STRIKES AND BOYCOTTS.

Necessity of strikes.—There is little dissent from the opinion that strikes are a necessary weapon of the workingman under existing social conditions. Mr. Gompers, president of the American Federation of Labor, does not believe that strikes can be entirely eliminated from our system of society, though he seems to hope that by a thorough organization of both the workers and the employers it will be possible, in a great measure, to secure their beneficent results without interrupting industry and commerce. He says, however, that every labor organization ought to accumulate a defense fund. Employers who know that their men have a defense fund which will enable them to resist will not lightly try to reduce wages, increase the hours of labor, or enforce obnoxious conditions. Labor organizations which have small funds or none are obliged to yield to deductions of wages when industrial depression comes, and when business revives they are the last to receive any of the benefits. He holds adequate preparation for strikes to be the best means of preventing them. No matter how just a cause is, unless it is backed up with power it will be crushed. Disputes are determined by contest and conquest, except when there is like power on both sides; then they are determined by reason. The same view is expressed by Bishop Potter. He says that the employers are likely to contend against increase of wages or shortening of work days until they realize that the employees have force enough to meet them in a contest. Bishop Potter regards the strike as a reversion to barbarism, but considers that it is necessary under present conditions, just as war is necessary.³

¹ Vol. VII: Schonfarber, 424-427; Gompers, 596, 598, 648.

² Vol. VII: McNeill, 114.

³ Vol. VII: Gompers, 598, 599, 607, 609. Vol. XIV: Potter, 11.

Legal restrictions of strikes.—One or two witnesses think it would be desirable to forbid by law any interruption of work, either by employer or by employees, without a previous notice of 5 or 10 days. Such a period of waiting, it is thought, would give hot tempers time to cool, and would also give a State board of arbitration opportunity to intervene and bring the parties together. One Southern witness would make it a felony to strike or to order a boycott or a lockout, at least after the compulsory arbitration board which he would establish had rendered its decision. He believes that there is a strong sentiment in the South in favor of such action, and that something of the kind will before long be done there.¹

Causes of strikes.—Mr. Gompers says that strikes take place against reduction of wages, increase of hours, political intimidation, victimization for activity in the cause of the workers, and the blacklist. They take place for less hours, for better wages and better surroundings, and to maintain the rights of unionism; that is, to maintain the organization by which the rights of the workers are protected and advanced. Among the causes of strikes, as distinguished from the objects which they are intended to attain, other witnesses mention the unwillingness of employers to recognize trade unions; lack of cordiality on the part of employers toward the men; the greed of employers and the greed of the workers, and the desire of the walking delegates to keep their positions, which, it is alleged, they would feel to be insecure if there were no trouble. Several manufacturers insist upon the supposed activity of agitators as a chief cause of labor disputes. On the other hand, the secretary of the National Association of Builders considers that employers are almost wholly to blame for labor disturbances, because they have vastly greater opportunity for knowing the whole situation than the workmen have, and their responsibility for wise action is therefore far greater. There is a general agreement that industrial prosperity tends to increase the number of strikes. There were about 70 per cent more strikes in New York State during 1899 than during 1898. The chairman of the board of mediation and arbitration of the State of New York says that the great increase was due to the general improvement of conditions. Wages are the last thing to rise, and the general rise of prices and the apparent prosperity of employers made the workmen impatient.²

Results of strikes.—While one or two representatives of the manufacturers and one nonunion workman regard strikes as an unmixed evil, the representatives of labor organizations are unanimous in their belief that the results of strikes are upon the whole favorable to the working class. Some admit that the immediate results of strikes are unprofitable to all concerned, but in the long run they are declared to have brought to the workers, both organized and unorganized, a more equitable share of the social product. When the trouble and loss of a strike has once been experienced, both sides are more ready to give fair consideration to each other's claims. Mr. Gompers seems inclined to believe that even the immediate results of strikes, when broadly considered, are usually favorable to the workmen. Even if a strike is lost, those who take the place of the strikers have probably bettered their condition; and it is only in isolated cases, he declares, that strikers take new positions under conditions worse than those they struck against. Moreover, the immediate cost of strikes is not nearly as great as it is commonly thought to be. Workmen are seldom, if ever, employed throughout the whole year. A strike simply transfers the period of idleness from the time when it is of advantage to the employer to the time when it is of advantage to the employees.³

Methods of inaugurating strikes.—Several witnesses refer to the checks which the rules of the national unions put upon the inauguration of strikes. The decision to strike must be made in the first place by the local unions, usually by secret ballot,

¹ Vol. VII: Bishop, 479, 480; Coffin, 779, 797; Smith, 979.

² Vol. VII: Gilbert, 874, 876, 879; McMaekin, 799, 800; Gompers, 605, 606; Coffin, 777, 794.

³ Vol. VII: Russell, 387, 388; McNeill, 115, 116; Gompers, 608, 618. Vol. XIV: Fox, 144; O'Donnell, 555.

in order that the real judgment of the members rather than the judgment which fear of their fellows might lead them to express may be recorded. In many nations unions a two-thirds or a three-fourths vote of the local is required; and it is usual to forbid the actual beginning of a strike until repeated efforts at adjustment have been made, both by the local union and by the national authorities.¹

Violence in strikes.—The representatives of the labor unions unanimously protest that the unions do everything in their power to preserve peace in strikes, and that when violence occurs it is the work of outsiders or of a few irresponsible individuals. This is admitted, as regards a large part of the contests, even by witnesses who are strongly opposed to the general methods of the unions. A representative of the Cigar Makers' Union asserts that when labor difficulties arise employers hire men to place themselves among the workingmen, partly as spies and partly as fomenters of disturbance. He cites an instance, said to have been proved in court, in which a detective in the pay of the employers joined the strikers, and did his best, though without success, to instigate both personal violence and arson.²

Legal right to strike.—Two or three witnesses refer to the fact that every strike was treated as a conspiracy at common law and under the statutes until 1824 in Great Britain and until about 1840 in the United States. Mr. Hourwich, an attorney, says that the right of workmen to strike has not even yet received unqualified recognition. The New York statute exempts a strike for the purpose of obtaining an advance in wages or for opposing a reduction in wages from the common-law rule regarding conspiracy. But this statute, creating an exception from the common law, will be construed strictly under the familiar rule. Anything not expressly contained in it will be excluded, and strikes do not always result from disputes about wages.³

Injunctions in strikes.—One of the bitterest protests of the representatives of labor is directed to the present use of injunctions against strikers and their friends. Peaceful persuasion to keep workmen from taking the places of their fellows is believed to be within the plainest rights of workingmen, and interference with it by the courts is felt as a gross injustice, and as indicating the sympathy of the courts with the employing class and their lack of sympathy with the workingmen. Injunctions which are believed to have no foundation in justice have frequently been sustained by the highest courts, but even when the higher courts have overthrown them the purpose of them has none the less been served. The purpose of them is to break up the strike, and before the injunction can be carried to a higher court and there dissolved the strike will have been ended if the injunction has been obeyed. Mr. Gompers points out that though the injunction is supposed to issue in order to prevent the doing of an injury which would be irreparable, and for which there would be no adequate remedy at law, the injunction itself does an injury of exactly that sort, however unjust and illegal it may be and however promptly it may be overthrown when it is brought before the higher court. The way in which injunctions have been used in recent years is declared by several witnesses to have greatly lessened the respect of the workingmen for the courts, and even to have diminished the intensity of their patriotism. The desire is expressed that the power of the courts to issue injunctions in labor cases be restricted or altogether removed, and especially that persons accused of violating injunctions in such cases be given the benefit of a jury trial. The use of the injunction, it is declared, does away with the right of trial by jury and shifts the burden of proof upon the defendant.⁴

Boycotts.—The right and the necessity of the boycott are upheld by several representatives of labor. Mr. Gompers, in particular, makes an extended argument for

¹ Vol. VII: Gompers, 609; Kennedy, 742. Vol. XIV: Fox, 143.

² Vol. VII: Thompson, 717, 720; Coffin, 778, 794. Vol. XIV: Rixey, 62, 66.

³ Vol. VII: Strasser, 262, 263. Vol. XIV: Hourwich, 154.

⁴ Vol. VII: Garland, 88, 89, 96; Donnelly, 290, 291; Schonfarber, 431, 432; Gompers, 611, 612. Vol. XIV: Fox, 146.

it. He declares that everyone has, as a matter of course, the right to refrain from dealing with any person whom he does not choose to deal with, for any reason which may seem to him sufficient. It is equally plain that boycotters may use moral suasion to enlist others in their cause, and that their friends may cease dealing with those who have given offense. The ground on which certain forms of boycotting have sometimes been declared illegal is that the boycotters resort to threats, intimidation, and coercion to induce others to join in the boycott. But the threat which they use, Mr. Gompers points out, is merely the threat to withdraw their patronage. They have a right actually to withdraw their patronage; much more, therefore, have they a right to threaten to withdraw it. The fallacy and injustice of the condemnation lie in the implication, carried by such words as "threaten" and "intimidate," that some wrongful act has been done or threatened.

The legal right of boycotting, Mr. Gompers declares, should be recognized, and the more generally it is recognized the less it will be used. To try to outlaw a man for doing what he has a perfect right to do is likely to arouse a feeling which will make him the more determined to do it.¹

ARBITRATION, MEDIATION, AND CONCILIATION.

Compulsory arbitration.—A considerable number of witnesses favor a general application of compulsory arbitration in labor differences. It is strongly advocated by two who are strenuously opposed to trade unions, and who seem to view it as a means of repressing their activity. One of them says, in terms, that he would not have labor organizations recognized as such by law or by the arbitration board. Some representatives of the unions, however, are also in favor of compulsory arbitration, and seem to view it as a means of securing the public investigation of the actions of employers.²

A much larger number of witnesses favor compulsory arbitration in the labor disputes of so-called public-service corporations, particularly railroads and street railroads. The fact that these corporations receive certain special privileges from the public is felt by some to give the public special rights in dealing with them; and the opinion is also expressed that strikes in these industries are specially injurious to the public. One witness, however, believes that a strike in a cotton mill, involving the means of livelihood not only of the operatives, but also of the retail dealers in the town, is as injurious to the public as a street-railway strike.³

A very large number of witnesses, however, are absolutely opposed to compulsory arbitration under any circumstances. It is argued that to compel men to work on terms which they are not willing to accept is slavery, and that to compel employers to run their works and pay wages they are not willing to pay is confiscation. Several representatives of the workmen add that the action of any governmental body, such as a court of arbitration, would probably be hostile to the men, as the action of the courts usually is.⁴

The possible means of enforcing the awards of an arbitration court are considerably discussed. Some of the witnesses assume that the only means of enforcement against the men would be by imprisonment. Several of the witnesses, whose attitude toward compulsory arbitration is more friendly, held, however, that fines, to be levied on the unions as corporate bodies, would be sufficient. Indeed, it is repeatedly asserted

LXXIV INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

that no penalty at all would be found necessary. A strike has small chance of success unless it is backed by public opinion. The men would lose this support if they resisted the decisions of a court of arbitration, and they would not venture to do it.¹

The compulsory-arbitration law of New Zealand is referred to by many witnesses, and is fully described by the commissioner of labor statistics of New York, and by Mr. Lusk, a former member of the New Zealand parliament. This law provides for six courts of conciliation in the several centers of population and for a central court of arbitration, to which appeals from the courts of conciliation may be taken. The great majority of all cases handled are carried to this court. Only organized bodies of employers or of employees can appeal to the courts; but the decisions may be made binding upon all persons engaged in the industry concerned. It is asserted that there has not been a strike in New Zealand since 1894, when the law was passed. There has been no case of refusal by either party to accept an award in toto, and there has been no breach of an award by a trade union. There have been violations of awards by employers, in matters of technicality and detail. It is pointed out, however, that the whole experience of New Zealand under the law has been in a time of industrial prosperity and rising wages. Mr. Lusk asserts that wages have probably risen nearly one-third, on an average, during the six years between the enactment of the law and the giving of his testimony. The real test of the efficacy of the law will come with hard times. As bearing on the value of the experience of New Zealand as a basis for judging of the advisability of compulsory arbitration in the United States, it is pointed out that New Zealand is a small country, having only some 800,000 inhabitants, scattered over a considerable area, and having only a low industrial development.²

Several witnesses who disapprove of compulsory arbitration think more favorably of the public investigation of labor disputes and the rendering of a decision by a public body, without any attempt to enforce the decision. Others would compel the employers and employees to meet each other and try to come to an agreement. It is pointed out that a large proportion of all disputes are due to misunderstanding, and would be obviated by a frank and free discussion between the parties. It might be forbidden to inaugurate a strike or a lockout until conferences between the parties had been held. Several witnesses regard the refusal of employers to recognize the organizations of the workers as one of the chief obstacles to such settlement; and they would accordingly compel each party to recognize and receive the duly elected representatives of the other. This provision was embodied in a bill which the Ohio State board of arbitration had agreed on for presentation to the legislature.³

Arbitration and conciliation by State boards.—A considerable number of States have provided by statute for State boards, whose duty is the settlement of labor disputes. These boards have not been active, however, except in some half dozen States. Those of New York and Massachusetts have been especially prominent, though the boards of New Jersey, Ohio, Indiana, and Illinois have also done active work.

Very little seems to have been accomplished in the way of actual arbitration. Neither the employers nor the workmen seem to be generally desirous of arbitration by the State boards. It is felt that the members of the boards lack the technical knowledge which arbitrators ought to have, and that on this account if arbitration is to be undertaken it is better that the arbitrators be specially chosen for each case from among persons familiar with the technical conditions of the particular trade. Some witnesses also express distrust of the State boards on the ground that the members are chosen for political reasons.

The members of the boards themselves place the greatest emphasis upon the value of their activity in bringing the contending parties together and inducing them to

¹ Vol. VII: Spohn, 152-154; Gilbert, 879.

² Vol. VII: Wright, 11; McMackin, 806, 806; Lusk, 882-887, 891, 892.

³ Vol. VII: Garland, 87; Bishop, 475-477; Gompers, 612, 618.

discuss their differences face to face. In some of the States the boards have power to conduct public investigations, summon witnesses, and reach and publish conclusions. This power has in many cases been found valuable. Parties to disputes who have refused beforehand to accept the mediation of a board have sometimes ultimately accepted its conclusions. In any case the placing of the facts before the public as they are determined by a disinterested authority enlightens public opinion and tends to a just settlement of the quarrel.

A few States have made provision for the enforcement of the decisions of State boards when both parties have previously agreed to abide by them. There appears to have been no case, however, in which this power of enforcement has been actually used.¹

Trade negotiations and agreements.—There is an almost universal agreement that direct negotiations between the parties are the best means of settling differences when such negotiations can be brought about. If an agreement can not be reached in this way, the next best thing is generally considered to be a board of arbitration, chosen by the parties themselves from among employers and employees in the same industry, but unconnected with the existing dispute. This plan offers the great advantage of providing judges familiar with the technical matters to be brought before them, as well as judges personally satisfactory to the disputants. If such a board can not reach an agreement, an outside umpire may be called in, and if the appointment of such a board is not found practicable the whole decision may sometimes be committed with advantage to persons unconnected with the trade. Bishop Potter speaks of the board of mediation and conciliation of New York City, a voluntary organization established by him and several other persons interested in the betterment of social conditions. This board is declared to have won the confidence of the working men and to have been of material assistance in the settlement of several trade disputes.²

In several trades, as the steel industry and stove founding, wages, hours, and other conditions of employment are fixed by agreement, either annually or at other intervals, between associations of the employers and of the employees. The witnesses who have participated in such agreements, as well as others who refer to them, regard this plan as most beneficial wherever it can be brought about. It is repeatedly pointed out that for an efficient carrying out of it strong organizations on both sides are necessary. Without such organizations to enforce the agreement, employers will be inclined either to refuse to recognize it, or to break away from it as soon as submission to it seems to involve any disadvantage. Such agreements, when they are well maintained, are of distinct advantage to employers, both in putting all employers upon an equality in respect to the cost of labor, and in making it possible to reckon with certainty on labor cost at future times. One of the board of managers of the Builders' League of New York regretted the absence of any such agreement, at the time of his testimony, with the New York City carpenters. Every employer got carpenters at such rates as he could. This was advantageous to small employers, who were able to pick up journeymen at low wages, but it greatly embarrassed large contractors, who were obliged to take contracts for work 18 months or 2 years ahead. It was quite impossible to say what the cost of the work would be when the time came for executing it.³

TOPICAL DIGEST OF EVIDENCE.

Prepared by GAIL LAUGHLIN.

I. GENERAL CONDITION OF MANUFACTURES AND BUSINESS.

A. Relation of prices to industrial conditions.—Professor COMMONS calls attention to the fact that every period of industrial prosperity is accompanied by a rise in prices, and every period of depression by a fall of prices. He says that the price index number is the best statistical index of prosperity which has yet been devised. It ought to be combined with an index of the volume of business, but that has not yet been worked out by statisticians. (35.)

B. Trusts and industrial combinations.—1. *Advantages of combination.*—Mr. HARRAH, president of the Midvale Steel Company, says that though his company does not belong to any trust, he is a firm believer in the beneficial effect of trusts. One of their greatest benefits is in putting all buyers on an equality, and making prices stable. The Pennsylvania Railroad, through its ownership of stock in other roads, is able to dictate the price at which coal is to be sold to consumers, and to make sure that all pay the same price. It is a matter of perfect indifference to the Midvale Steel Company whether the price of coal is \$1 or \$10 a ton, so long as no competitor gets a lower price.

The furnace men have an understanding by which the price of pig iron is fixed. When Mr. Harrah makes a contract for pig iron, he knows that nobody else gets a lower price. A company like the Midvale Steel Company must make contracts which it takes 2, 3, and 4 years to complete. It is essential to know what the cost of raw material and of labor is going to be. The great capitalistic combinations steady the price of raw materials, and the labor organizations steady the price of labor.

Mr. Harrah believes that the tendency of the trusts is to lower rather than to raise the price to the consumer. They are bound to be carried on on a more business-like basis than smaller concerns, because they can afford to employ the best talent, and do employ it. All of the raw materials of the Midvale Steel Company are controlled by combinations, and their dealings have been satisfactory and fair. (350, 357, 358.)

Mr. ROBERT T. DAVIS, president of the Stafford, Wampanoag, and Algonquin Print Mills, thinks that the formation of industrial combinations is a natural evolution in business. He believes in getting rid of domestic competition through combination. The industrial combinations which are being formed will secure to this country a very large foreign trade in the future. The people abroad are beginning to see this, and some of them attribute the growth of our foreign trade to the formation of vast combinations of industry in this country. In the print-cloth industry competition in prices has been abolished and the manufacturers are obtaining prices which enable them to make a respectable profit. They do not exact any inordinate price, and it would not be policy for them to attempt to do so. (593.)

Mr. JOHN A. O'NEILL, a pottery worker of Trenton, says that intelligent, conservative organization on the part of the manufacturers of pottery would in great measure do away with cut-throat competition. Organization is absolutely necessary for the prosperity of the industry. If the manufacturers continue the cut-throat competition which has been going on, there will have to be a higher tariff on pottery or the cost of production will have to be lowered. (656.)

Mr. ALFRED WILLSON LAWSE, secretary and treasurer of the Trent Tile Company, says that the tile industry would be a great deal better if all the concerns were united in one consolidation. If the plants were consolidated, offices could be established throughout the country and the manufacturers could be brought into direct contact with the consumers. The individual concerns can not afford to do this. (634.)

Mr. WILLIAM C. REDFIELD, treasurer of J. H. Williams & Co., manufacturers of drop forgings, says that he has no fear of the present tendency toward industrial combination. The process of industrial combination holds within itself the ele-

ments which will decide whether or not it is to the public advantage, without regard to what any group of men, whether legislators or not, can do. There is a question, though, whether men can always be had who are capable of managing business on such an enormous scale. (668.)

2. *Evils of combination.*—Mr. CRESSON, president of the Manufacturers' Club, Philadelphia, while holding that extreme and unnecessary competition has produced serious evils, among which is a decrease of business honor, thinks that business consolidation may produce evils greater still. The difficulty is to find men large enough to manage a great consolidation. A man who assumes the control of such an organization has to work far harder than before. Mr. Cresson has seen men in such cases gradually fall and drop out; then somebody else has tried to do the business; he could not do it, and the consolidation has fallen through. Consolidations to eliminate expense are a mistake; business should be done as it has been done, with necessary modern improvements. (272.)

Mr. SIMEON B. CRASE, treasurer of the King Phillip Cotton Mills, does not think that, as a rule, industrial consolidation is a good thing. The consolidations are, as a rule, carried on in such a way as to perpetrate a swindle upon the public. A great deal, of course, depends on the way in which business enterprises are handled after consolidation. Under certain circumstances consolidation might be the very best thing. There is a good deal to be accomplished in the way of steadying production and prices, so that there will be a more uniform condition of things in the market. (568.)

Mr. STEINBISS, general secretary-treasurer of the National Building Trades Council, believes that industrial combinations are injurious to the workmen, skilled and unskilled. If more men are employed, and at better wages than 2 years ago, that is because general conditions are better, and not through the efforts of the corporations, whose stockholders are unacquainted with their workmen and deal with them through hired agents. The witness does not believe that the tendency of combinations is to pay better wages or to strengthen the labor organizations. They have to hire union men to a great extent, because the union men are the best mechanics and give the most work and the best work to their employers. If the trusts have raised wages it is because they have to employ organized labor, and can not afford to have a fight on their hands. The tendency of the combinations is to close establishments which, but for them, would have been at work, and in other ways to diminish employment. A labor organization is a kind of trust; but it is a beneficial trust, and endeavors to elevate mankind, while the other is simply for profit and injures industry. (80, 81.)

3. *Overcapitalization.*—Mr. HARRAH, while considering industrial combinations desirable and advantageous, declares that the majority of the capital that is represented in their stocks has no existence. He does not know of any corporations that are not too heavily capitalized to-day. The condition of things is the natural product of our civilization, however, and is bound to go on. (856.)

4. *Effect of combination on employment.*—Mr. RIXEY, commissioner of labor statistics of Missouri, says that when the Continental Tobacco Company bought out some of the large independent tobacco firms in his State it turned thousands of men and women out of employment. (77.)

5. *Legislation.*—Mr. ELMER P. HOWE, member of the executive committee of the United Shoe Machinery Company, believes that a national corporation act is desirable, if it can be constitutionally secured, so that there shall be no question as to the right of a corporation to do business throughout all the States and Territories of the country without being harassed by the imposition of annoying restrictions by the different States.

Referring to the Massachusetts corporation laws, Mr. Howe says that it is not practicable to form a corporation in Massachusetts, the value of the assets of which consists largely in patent rights or other intangible property. There does not seem to be any reason why the legislature should forbid a man to invest his money in a patent at the valuation which he and his associates agree to put upon it. The par value of the stock of a corporation is an entirely arbitrary thing. What a man looks to when he puts his money into a concern, is what the earning capacity of the company is or may be. (489, 492.)

6. *Nickel combination.*—Mr. HARRAH states that nickel is controlled by an international combination whose prices are regulated in London and are the same to everybody. Mr. Harrah buys of the Oxford Copper Company in New York, which belongs to the combination. The last advance in prices made from one day to another was from 28 to 42 cents a pound. (357.)

C. *Foreign trade.*—1. *Importance.*—Dr. W. P. WILSON, director of the Philadelphia museums, says that in the development of our export trade lies our com-

¹ On this point, see Reports of the Industrial Commission, Vol. XIII, Digest, p. cxxviii.

mercial safety. Had it not been for the phenomenal growth of our export trade and the consequent relief of the home market, the United States would already have been confronted with an economic situation almost as bad as that which existed in 1893. When it is remembered that our exports of all products 5 years ago were but \$793,000,000, and our exports of manufactured goods only \$183,000,000, while during the past year our total exportations reached \$1,478,000,000, with manufactured goods forming \$435,000,000 of this total, the enormous part played by our export trade in maintaining prosperity at home will be appreciated. During the last 5 years foreign markets have, in round numbers, absorbed \$2,245,000,000 worth of goods more than they would have done had the rate of export existing in 1893 remained stationary. (440.)

2. *Difficulties in way of development.*—Dr. WILSON says that we are entering upon a century which will witness an economic struggle among nations for commercial existence. Enormous as was the increase in the export trade of this country in the last year. Great Britain's percentage of increase was greater. If possible, effort will be made by foreign countries to dislodge American trade wherever it has obtained a foreign foothold and to stop its further advance, and the utmost energy on the part of American producers will be required in order that these hostile measures may not be successful. There is not sufficient recognition on the part of American manufacturers of the foreign market's value, or sufficient knowledge as to where the market is to be found, how to enter it most effectively, or how to develop it to the country's greatest advantage. Up to within a comparatively few years, the American manufacturer has been entirely absorbed in meeting the demands of the home market, while his foreign competitors have for generations made the subject of export trade a scientific study. Furthermore, the means for supplying ourselves with the necessary information concerning foreign markets are deficient. (440, 441.)

Mr. GRAY, secretary of the Manufacturers' Club, Philadelphia, says that the indisposition of American manufacturers to give long credits is one serious obstacle in the way of export trade. English and German firms often give credits of 6, 9, and 12 months, and South American houses are accustomed to that way of dealing. Mr. Gray does not think that the refusal of American manufacturers to adopt this method is based so much on considerations of safety as on disinclination and perhaps lack of financial ability to sell goods on long time. The relations between manufacturers and bankers are much more cordial in England and Germany than here, and this makes it easier for European manufacturers to give long credits. (207, 213.)

Mr. Gay says that the exports from Philadelphia to South America are far less than they should be in proportion to the trade with other countries. This is due largely to the fact that shipping facilities are defective and that there is lack of organized effort to secure the trade. There are lines running from New York to South America, but the quickest way to reach South America is by way of Europe. (206.)

Mr. HARRAH says that if one desires to do foreign business, one must be prepared to give long credits. He has seen about \$2,000,000 worth of dry goods sold in Brazil on 14 months' credit, the bills to be dated 6 months after the sale. When a number of German or British merchants settle in a certain territory, a branch of a home bank is immediately established and gives them all the credit they need. The Germans do even better than the English in giving their merchants facilities in establishing foreign markets, and that is why the Germans are displacing the English. (356.)

Mr. WILLIAM C. REDFIELD, treasurer of J. H. Williams & Co., manufacturers of drop forgings, says that one of the serious obstacles to the development of our export trade is to be found in our present fiscal policy. Business men of other countries have repeatedly said in substance that American manufacturers are too grasping; that they are not content with the same conditions in foreign trade which they have in domestic trade; that in the one they consent to fair exchange, in the other they want it all their own way. Moderation in tariff matters should be the keynote of our future policy. By the use of moderation one of the serious obstacles to a successful export trade in manufactured articles would be removed. (361.)

3. *Methods of developing foreign trade.*—Dr. WILSON says that in order to extend their export trade American manufacturers must to a certain extent pattern after the articles already in use in foreign countries. The people get into the habit of using a certain kind of thing and hesitate to change. In the Argentine Republic it used to be that a one-handed plow was used. An American manufacturer a one-handed plow with a steel point and established a large trade. Our manufacturers must study the customs of foreign countries and adapt their goods to those countries. (454.)

Mr. GRAY says that an extensive foreign business has been established in some

lines by direct personal solicitation. The Baldwin Locomotive Works afford a conspicuous example. Sometimes several concerns unite in employing a representative to travel in foreign countries. Often a branch is established in London by an American house, frequently under a distinct name. One great purpose of this is to get the British colonial business. Mr. Gray's own firm has sometimes tried to get information from the consular service for the purpose of introducing goods; but when the information has once been obtained and the first entry made in a given country, no further dependence for help is placed on the consular officers. (207, 210, 211.)

Mr. Gray says that it is necessary that goods be so packed for export as to satisfy the shipping conditions of the countries of destination and the tastes of the people. In South America goods must often be transported on the backs of mules. This makes it necessary that packages shall not exceed a certain size, and shall have a certain form. In the Orient the people are accustomed to receive packages of a certain form and character, and goods otherwise packed are not satisfactory. European houses understand these needs and conform to the conditions. The Germans in particular are facile in changing their goods to meet the desires of the customer. "The English hang on to long-established models, and the Americans offer what they think is best; and between the two the Germans come in with what is wanted by the customer and beat them both." (207.)

Mr. Gray does not think it wise or safe to consider the foreign market a dumping ground for an unsaleable surplus. Neither is it wise to think that an inferior class of goods will sell abroad; goods for foreign shipment must be of high quality. (208.)

Mr. LEAKE, a manufacturer of cotton fabrics, thinks that there has been no concerted effort in the Philadelphia textile trade to secure foreign markets, except through the National Association of Manufacturers and through the collection of information by the Commercial Museum. Mr. Leake adds that the securing of export business is for the most part like the securing of domestic business. It must be done by personal application, industry, and a knowledge of the subject. (277.)

4. *Philadelphia Commercial Museum.*—(a) *Object.*—Dr. WILSON says that the Philadelphia Commercial Museum was not established for profit. It was established through an appropriation made by the city councils of Philadelphia. Fifteen of the leading business men of that city were appointed trustees, and the work of the museum is of a wholly impartial character. The aim constantly before the management of the museum is to equip the producers of this country with the same information which has been acquired by their foreign competitors through long years of study of foreign opportunities. The museum endeavors to point out to the manufacturer where markets in any part of the world for his products may be found and to give him detailed information regarding the requirements of those markets and the conditions surrounding them; to show him what competition he must expect; what the facilities are, and what the cost of transportation for his goods will be; what methods of packing must be observed; how collections shall be made, and what local prejudice or peculiarities exist. Furthermore, it suggests to him the most desirable firms with which to make business connections. The museum aims to benefit trade in every line. (441, 443, 444.)

(b) *Work.*—Dr. WILSON says that the Commercial Museum is in a position to show American manufacturers thousands of samples of foreign competitive goods which are sold in export markets. That the American producer may have an adequate idea of the resources of different countries, the museum has brought together an unequalled collection of raw products having a commercial value from nearly every country in the world. That the museum may keep in close touch with trade development in every land, it has formed an international advisory board upon which every important foreign chamber of commerce has membership. Commercial experts are frequently sent to different countries to study commercial conditions at first hand, with a view to making the information furnished American manufacturers as impartial and reliable as possible. The museum is able from its files to furnish descriptive matter regarding 120,000 leading foreign firms doing business at every point on the globe where business of any importance is transacted. The museum also has on file the commercial laws of all countries, and it has recently compiled a pamphlet giving the laws of trade marks in different countries. Ten thousand copies of this pamphlet have been distributed. The museum also has on file about 1,200 current journals, including the leading publications of commerce from every foreign government. Brochures on different subjects are frequently published and circulated freely.

The museum makes a nominal charge of \$100 a year to any firm which desires to have its interests abroad watched, and to have the museum send reports to it without request and to communicate to it anything of interest which may come

under its notice. During 1899 the income from fees was \$50,000; in 1900 it was over \$60,000. No inquirer, however, is ever turned away unanswered because he is not a regular fee-paying member. Information is furnished to merchants all over the country, and 80 per cent of the inquiries answered during the past year came from business men who paid nothing for the service rendered.

The museum sent out 27,308 reports in answer to inquiries received during the past year. Many of these reports are illustrated with photographs. These reports go very fully into details. After these reports are sent out the name of the report is recorded in the weekly bulletin, thousands of copies of which are distributed to manufacturers all over the country. During the past year, also, answers have been sent to 3,224 special inquiries from American producers, covering every conceivable subject in respect to foreign trade.

Every week the museum receives from 500 to 800 inquiries from foreign houses, and during the past year about 72,000 letters were written in answer to foreign inquiries. About 40 stenographers and typewriters are employed, most of whom write from two to five languages. With the present force the museum is able to handle business in about 18 different languages without trouble.

The running expenses of the museum amount to \$200,000 annually. It is building a large plant into which it has already put over \$700,000. The work is steadily increasing.

Three years ago the museum had a commercial congress, which was attended by 50 representatives from Latin-America. The representatives were taken by the management of the museum, expenses paid, to 25 of the largest cities in the country, and they were thoroughly informed concerning the manufacturing interests of each of these cities. Some of the representatives left orders in the country to the extent of \$1,500,000. One representative, who had previously bought supplies in Europe, bought 100 tons of samples of various kinds of manufacture to take to his commission house. On the whole, the congress and the excursion did more to stir up the thought of the possibilities of foreign trade than has been done by anything since the Pan-American Congress. (441, 442, 446, 447, 448, 450, 457, 459.)

Dr. Wilson says that the museum has relations with foreign governments, which it would be very hard for any other institution to duplicate. Many foreign governments are sending to the museum their publications, and the collection of publications of foreign governments possessed by the museum is more complete, so far as some governments are concerned, than is any other similar collection in the United States. The museum has sent out thousands of circulars to uninvestigated territories, such as Latin-America and the West Indies, stating that in its laboratories would be examined and tested any materials sent to it, and that the result of the test would be communicated to the sender, provided that all data were sent, and that samples large enough to make fine exhibits were provided. Numbers of different countries have voted money in their respective congresses for the purpose of investigating their own products and sending them to the museum. Some 400 different collections obtained in this way were sent to the museum during the past year. (444, 458, 459.)

Dr. Wilson says that during the past year many inquiries have been received at the museum as to whether the material which had been brought together and the information which had been collected could not be duplicated and sent out to a number of other cities. If this could be done, the advantages secured through the work of the museum would be more broadly extended, and merchants and manufacturers throughout the country would be stimulated to extend their foreign trade. With sufficient support, the work could be duplicated and sent to as many centers outside of Philadelphia as should desire to receive it.

The museum has held a number of exhibitions in different cities throughout the country. It has held exhibitions at Pittsburg, Pa.; Worcester and Springfield, Mass., as well as in other cities. A number of times, when the New England shoe manufacturers have met in Boston, the museum has sent to Boston 800 or 400 pairs of shoes that were made in England and other foreign countries and sold in foreign markets, and has sent an expert with the exhibit to supply information. The museum has not as yet held any exhibits in foreign countries, though that is a work that ought to be done. The first warehouse for the exhibition of American goods in foreign countries was established in Venezuela, and the concession for it was secured by the Philadelphia Museum. This concession was afterwards turned over to the National Association of Manufacturers and that association now maintains it. The Czar of Russia within the past year has established a warehouse of that kind for the benefit of Russia, and has exhibited in it all sorts of implements and materials which it was thought it would be advantageous for the Russians to become familiar with. Mr. Chamberlain has held a similar exhibition in London. (454, 456, 457, 458, 459.)

LXXXVI INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

(c) *Methods.*—Dr. Wilson cites as an illustration of the methods followed by the museum in obtaining information concerning foreign markets the method pursued in the attempt to gain the information necessary to answer the inquiry of an American manufacturer concerning a possible market for horseshoes. The museum found that there were some countries in which England was selling horseshoes. The museum then asked its agent in England to find out what firms in England were making horseshoes and where the horseshoes were sold. The agent followed the matter up until he learned the places where the shoes were sold and the names of the firms selling them, the prices charged, the method of packing, whether there was any tariff imposed, and under what conditions the shoes were sold at retail in the foreign countries. As a result of the information obtained by the museum, the manufacturer making the inquiry has established a foreign trade in horseshoes, and has recently had an order to send 10 carloads of horseshoes to South Africa for the use of the English army. Similar methods are followed in other cases.

The museum at one time sent a commission to China to make a complete study of the Chinese market. Permission was secured for the commission to travel through parts of China where traveling is not common. As a result, a large amount of valuable information concerning the Chinese market was collected.

Congress made an appropriation of \$50,000 for the use of the museum, and this money was spent in obtaining, so far as possible, samples of all the manufactured goods sold in foreign markets by the leading manufacturing countries of Europe. To do anything of that kind thoroughly it is necessary to have experts to go not only to the country which manufactures the goods, but also to go to the countries where the goods are sold and to make thorough investigation. About a thousand samples of goods were collected in Venezuela and sent to the museum. These goods were afterwards sent over to England and it was finally found out by whom they were manufactured and what prices were charged for them. (452, 453.)

(d) *Value of work.*—Dr. Wilson says that the work which has been done by the Commercial Museum has been a very important factor in the extension of our foreign trade, and that the results of its work lead unquestionably to the conclusion that there could be no more forcible factor in the development of foreign trade than the establishment of a number of commercial museums or bureaus in the great cities of the country. The practical value of the work done by the Museum is in part shown by the fact that during the past year nearly 5,000 foreign business houses applied to the museum to be placed in communication with the manufacturers of various kinds of American goods.

American manufacturers have found in some instances among the materials possessed by the museum better materials than those which they were using, and through the museum they have been directed how to obtain the better materials for use in manufacture. There are many manufacturers who have had their whole energies taken up with the home market, and who have scarcely as yet come to realize that they will be compelled to look abroad for trade. The museum has received thousands of letters from manufacturers, giving hearty commendation to its work, and in many cases the correspondents have said that they were enabled to extend their foreign trade through the assistance given them by the museum.

The value of the work done by the museum has been recognized in Germany, and the German minister of commerce, at a meeting called for the purpose of considering methods by which to secure more complete knowledge concerning foreign markets for the benefit of German industry, stated that the ideal method would be the establishment of a national commercial museum, and that there existed no better model of all that such a commercial museum should be than the Commercial Museum at Philadelphia. (442, 446, 455, 456.)

Mr. GRAY says that the work of the Philadelphia Commercial Museum has been beneficial, and has resulted in bringing inquiries and orders from South America, but the direct tangible results have not been as great as might have been expected. (306, 307.)

5. *Consular service.*—Mr. HARRAH says that the German and the English consular service give more attention than ours to a knowledge of local credits. The trouble with our service is that men are sent abroad as consuls who have not the business qualifications for the place. It is an exception to meet a consul who understands the nature or the duties of his office. Outside of the large diplomatic appointments, it is the same thing with our ministers. The consular profession is just as much a technical profession as engineering. It ought to be followed as a life work. No improvement can be made so long as we maintain our system of part-time appointments and short tenure of office. (357.)

Mr. STREET, a woollen manufacturer, thinks that where the consular agents are business men they are a great help in protecting both the Government and the

American manufacturer against undervaluations of foreign goods. Every consul or consular agent ought to be a business man, with an expert knowledge of such goods as are produced in his district. They ought to have a long tenure of office, for it takes long service to give proper knowledge. (241.)

Dr. WILSON says that three or four years ago Congress passed a resolution asking the State Department to put the consular service at the disposal of the museum with regard to furnishing commercial information, and that there has been most hearty cooperation on the part of the Consular Bureau. As a rule, consuls send important communications to the Consular Bureau first. No consul has been appointed who has not been invited to visit the Philadelphia Museum and to study its work, and to become familiar with the information which it was able to give concerning conditions in the country to which he was going. When the bureau receives any important information it communicates it to the Consular Bureau whether it is received from a consul or not. While many of the consuls appointed are competent to fill their positions, others are not, and there ought to be a law putting the consular service under civil-service regulations. A good consul studies his locality, and tries to find out how the trade of this country may be extended in that place. (449.)

6. *Special trade-marks.*—Dr. WILSON says that in some countries, such as China, Japan, Persia, and in all countries where there are special superstitions, it is sometimes rather difficult to know how to introduce a trade-mark which will not run counter to some prejudice, or in some way injure the sale of goods instead of aiding sales. The Philadelphia Commercial Museum has taken special interest in looking up the matter of trade-marks in China, and has had prepared four large volumes of trade-marks made from hand sketches by native artists. It pays manufacturers to put a Chinese trade-mark on goods designed for the Chinese market, and the museum had these trade-marks prepared for the use of manufacturers who are especially looking for Chinese trade. English manufacturers are, in some cases, using special trade-marks in China. There has not been a single case found as yet where American manufacturers are making use of special trade-marks in that country. It is a well-known fact that the finely prepared trade-marks used by the Germans go a great way toward selling their goods in South America and in other countries. (450, 451.)

7. *Banking facilities.*—Dr. WILSON says that our export trade is hampered by the lack of banking facilities controlled by American citizens. It is a well-known fact that on all the trade which we have with South America we pay a fine percentage to London bankers. As a rule we have to do all our banking for South America through London. It would be of great advantage to our foreign trade if we had a direct connection. (460.)

Mr. GRAY thinks that international banking facilities would be of some advantage in foreign trade, but he doubts whether the lack of them has restricted business relations to any large extent. His own firm has found no difficulty of that kind; indeed its foreign sales are made chiefly to commission houses at home, f. o. b. New York or Philadelphia, and the commission houses pay cash. Mr. Gray's firm has scarcely anything to do with foreign exchange. (207, 210.)

8. *Export prices.*—Dr. WILSON says that the exporters of all countries charge lower prices in foreign markets for goods than they charge in the home market. After running their plants to the extent necessary to produce sufficient for the home market it pays them to run their plants the rest of the time for the foreign market, selling their goods in the foreign market at lower prices. This condition prevails irrespective of the economic policy of the countries in regard to tariffs. (456.)

Mr. CHARLES F. HOMER, treasurer of the silk association of America, says that not only in this country, but in every other country, manufacturers sell goods abroad at lower prices than they sell them at home. They do not do this because they want to do it, but because of the condition of the market. The manufacturer disposes of his goods at home if he can get the best price there for them. If he can not dispose of them at home satisfactorily, he sends them to the next best place. There are times when a manufacturer's production is greater than the demand for his goods, and he must either stop his business entirely or dispose of his goods as best he can. Before the adoption of our tariff policy European silk manufacturers used to send large consignments of their surplus products to this country. If they had been able to dispose of those goods to advantage at home, they never would have sent them here. It is not only more profitable to run a mill on full time, but it is sometimes a necessity. If the mill is closed down, the help becomes disorganized, and when they are wanted again it is found that they have obtained other positions. (701, 702.)

Mr. REDFIELD says that it is a fact known everywhere in manufacturing circles that manufacturers sell their goods in Europe at lower prices than at home. (661.)

D. Tariff.—1. *Advantages.*—Mr. STEEL, a worsted manufacturer, thinks the tariff has largely added to the population of this country, as well as increased the industries. It has brought people to this country to do work here which they were accustomed to doing abroad. It may be that, in the course of many years, competition among ourselves will make our cost of production the lowest in the world; but to reach such a condition we need a continuance of the protective policy. Besides, people who have made investments on account of the policy of the Government are entitled to a reasonable continuance of that policy.

The working people get the larger part of the benefit of tariff protection. "Competition among manufacturers keeps prices very low, but that competition can not be visited directly upon the work people; their wages are quite firmly fixed. If we take an order for goods at a low cost, we can not take it off the work people." (245, 246.)

Mr. JOHN HOPEWELL, a manufacturer, of Boston, says that the benefit derived from the tariff by one industry is reflected in other industries. For instance, when the steel business is good and all hands are employed, general business is good and everyone participates in it. If any large industry becomes crippled, depression gets in the air and business is demoralized. (524.)

2. *Revision of the tariff deprecated.*—Hon. WILLIAM F. DRAPER, president of the Draper Company, says that any discussion of the tariff, with a view to change, would necessarily check business for the time being and cause a disturbance of industrial conditions. There would have to be a very serious and troublesome state of affairs to justify the entering into a general tariff discussion. (471.)

Hon. WILLIAM W. CRAPO, president of the Wamsutta and Acushnet Cotton Mills, says that a revision of the tariff at this time is not to be desired, though changed conditions may, after a while, make a revision of rates desirable. Agitation of the tariff always unsettles business and creates apprehension. The amendment of one or two tariff schedules is quite impracticable without opening up the whole tariff question. (537.)

Mr. OTTO ANDREAE, jr., a silk manufacturer, says that the need for changes in the tariff schedule on silks, is not great enough to justify tariff revision. General tariff revision always causes business stagnation. (691.)

Mr. FRANK W. CHENEY, treasurer of Cheney Brothers, says that it would be better to let the general tariff schedule on silks with all its imperfections remain as it is than to undertake any revision of the tariff. (732.)

Mr. JACOB WEIDMANN, of the Silk Dyeing Company of Paterson, New Jersey, says that a general agitation of the tariff at this time would be a misfortune. (707.)

Mr. PIERCE, president of the New England Cotton Yarn Company, says that any tinkering with the tariff will produce disturbance in business. (542.)

Mr. SIMON B. CHASE, treasurer of the King Philip Cotton Mills, says that he should regret to see the tariff touched in any way. (559.)

Mr. GEORGE MCNEIR, Secretary of W. & J. Sloane, carpet dealers, says that the agitation of the tariff question always brings uncertainty into business and has a depressing effect upon trade. The changes in the tariff which he recommends are not important enough to justify general tariff revision. The recommendations have been made with reference to the time when tariff revision is inevitable. (718.)

Mr. JOHN A. CAMPBELL, general manager of the Trenton Potteries Company, says that tariff revision has in general a very bad effect upon the industries of the country. The pottery manufacturers are perfectly satisfied to have the tariff left as it is. (628.)

Mr. ROBERT T. DAVIS, president of the Stafford, Wampanoag and Algonquin Print Mills, says that tariff revision has usually disturbed business very much, and that any changes in the tariff should be undertaken with great caution. It does not seem to be practicable to change one schedule of the tariff without opening the whole question. So far as the removal of the tariff from iron and steel products is concerned, it is Mr. Davis's opinion that such legislation would be disastrous to the concerns outside the trust, unless the industry has reached that point where those concerns can make large profits without any protection, and that does not seem to be the case. (593.)

Mr. WILLIAM M. WOOD, treasurer of the American Woolen Company, says that it is very important for the woolen manufacturers to have stable conditions, and they would deplore any tariff legislation at this time. They would rather go along just as they are for a few years than have any change. They want a little period in which to get adjusted to existing conditions. (516.)

Mr. JOHN HOPEWELL, a manufacturer, of Boston, says that a general revision of the tariff would have a disastrous effect on business. If the protective tariff were abolished, American wages would necessarily go down substantially to the level

of the wages paid in other countries. The consuming capacity of the American people would be very much reduced, and that would affect business in general. One great reason why this country offers the best market in the world is that the people consume more per man than do the people of any other country in the world. (524, 525.)

Mr. LINCOLN GODFREY, president of the Eddystone Manufacturing Company, says that he does not want to see another general revision of the tariff in his time. It would be very disastrous to business. (478.)

Mr. HARRAH, president of the Midvale Steel Company, is a free trader by conviction, but declares that to adopt free trade in this country would unsettle everything. People accommodate themselves to existing conditions. If a still higher tariff were to prevail, Mr. Harrah would adapt himself to that. The great evil is change. "It is far better for us to let the tariff alone for some time now. We have just got through a period of great anxiety, and now we want 4 years of rest. Now let us have that rest. Don't touch the tariff and I will not touch the question of free trade." The Midvale Steel Company has only three customers—the Government, the shipyards, and the railroads. It prospers when the shipyards and the railroads prosper. While it would like to have some changes made in the tariff for its own benefit, they might hurt somebody else; "and it would hurt us more to have a change made than to endure the little annoyances we have to put up with now." (355.)

Mr. LEAKE, a Philadelphia cotton and linen manufacturer, thinks that it would be unwise to attempt any change in the tariff. It takes time to adjust business to new laws and new conditions. We have only fairly got adjusted to recent economic changes. Doubtless there are some inequalities in the tariff. For instance, the existing tariff on linen yarns is quite high in comparison with the duties on the woven product, and there is very little linen weaving in this country. If the spinner were willing to divide a little with the weaver, he could create a market for his yarns by inducing weavers to engage in novelty work of all sorts with linen as a basis. The same thing appears in the cotton industry. The market value of cotton yarns is far below the importing price, including the duty, but during the last year the prices of cotton yarns have been manipulated by agreements between the spinners. The manufacturers about Philadelphia of novelties and specialties in woven goods, because of their changing output, which requires now one class of yarn and now another, seldom undertake to do their own spinning. They are dependent upon the market, and when the price of yarn is raised by manipulation the market for the woven goods is curtailed. Mr. Leake himself has been compelled to withdraw his line of samples from Australia. It is better, however, to bear any slight disadvantages that the present tariff arrangements may involve than to run the risks of change. (274, 275.)

Mr. STEEL strongly urges that there be no change in the tariff laws. He would rather submit to any of the inequalities and disadvantages of the present law than to a general stirring up of the question. Disturbance and agitation, with a constant fear of change in the laws that govern one's business, produce a horrible condition of life. (246.)

Mr. JOSEPH G. JACKSON, secretary of the Slasher Tenders' Union of Fall River, would not advocate any sudden or radical change in the tariff. Reciprocity, as proposed by Mr. Blaine, should be adopted. Competent men should be appointed as consuls, and they should try to build up the trade of the United States by offering inducements in the line of reciprocal trade relations. We can produce more cotton cloth in this country than we can consume. It is true that our exports are increasing; but we have not the foreign market which we ought to have. We should establish reciprocity with the countries of South America if we can do so without unsettling our own market or our own economic conditions. Any changes in the tariff should have in view the preservation of industries and of employment in this country; but the law should not foster some little insignificant industry at the expense of some large one. (587, 588, 589.)

Mr. CRESSON, a manufacturer of transmission machinery, thinks that the business depression of 1898 was entirely due to the tariff change. Business had been adjusted to a certain tariff arrangement, and the alteration of it put a stop to everything. Mr. Cresson thinks that the most important thing is to have business entirely separated from politics. "The business of the country should be on an entirely different basis from anything that could be affected by politics, and until we can get that done I do not see how we can have steady business." General revisions of the tariff, with a large number of manufacturers going down to Washington and trying to get the tariff placed as high as possible on their particular products, are most unfortunate. Mr. Cresson is not at all an advocate of a high tariff. He thinks the tariff should be as low as possible, affording a fair profit to manufacturers. Excessively high rates give enormous profits for a time, and the

result is demoralization. Mr. Cresson's own business is not at all affected by the tariff, except indirectly through its effect on his customers. (287-289.)

3. *Trusts and the tariff.*—Mr. CRAPO says that the domestic competitors of trusts would be more injured by the repeal of the tariff than would the trusts themselves, for the reason that the withdrawal of tariff protection would destroy the small competing industry, while the trust, with its larger capital, enormous resources, and superior organization, might, in the absence of home competition, survive and become even more of a monopoly. (538.)

4. *Ad valorem and specific duties.*—Mr. CRAPO thinks that it is quite advisable, in fixing tariff rates, to mingle an ad valorem with a specific duty. A specific duty undoubtedly prevents undervaluation. Sometimes it is desirable to start with a specific duty and then add to that an ad valorem duty. (538.)

5. *Desirability of a tariff commission.*—Mr. MCNEIR believes that there should be appointed a permanent tariff commission. The members of the commission should be appointed perhaps for life, and should be paid salaries sufficient to enable them to devote their entire time to the subject. They should also be given power to arbitrate some of the differences which may arise, having, perhaps, some of the duties, privileges, and powers of the present board of appraisers. If these men were selected with reference to their especial fitness for the position and without regard to their party affiliations, the appointment of such a commission would result in a better adjustment of tariff schedules than can be secured in any other way. The commission would not, of course, frame legislation, but it could submit reports on which Congress would base its action. (718.)

E. Patents. Copyrights.—1. *Erroneous granting of patents.*—Mr. GIBSON, a manufacturer of gas and electric fixtures, complains of the ease with which patents are sometimes obtained for alleged inventions that are not inventions. His complaint is based upon a costly experience of his own. It was natural, he says, that, when the electric light came into use the manufacturers of gas fixtures should make electric fixtures; indeed, an electric fixture is a gas fixture except that it is not necessary to make the joints tight, because there is no gas to escape from it. But when the gas-fixture people were giving their attention to the new demands upon them, a workman was observing what was being done in the factory where he was employed, and he brought the matter to the attention of a New York patent attorney who was very successful in getting up specifications and claims. This attorney drew up an application embracing perhaps a dozen claims, and covering everything pertaining to the manufacture of an electric fixture. There was absolutely nothing of new invention in it. The application was refused over and over again; but finally, under circumstances which seem to be surrounded with mystery, the patent was granted. That was in 1882. Very few of the manufacturers recognized the patent. Mr. Gibson and four or five others thought it better to pay a 3 per cent royalty than to risk a lawsuit, and they took out licenses. In 1889 a combination was formed in the gas and electric fixture business. Mr. Gibson was the only prominent manufacturer who refused to go in. In 1892 Mr. Gibson's license under the patent expired. When he applied for a renewal of it, he found that the managers of the combination had come to an agreement with the owners of the patent, and that he could not get a renewal of the license unless he joined the combination. He refused. Suit was brought against him. He won at last, but the suit cost him \$18,000 in cash, besides a great loss of business. The patent was then surrendered. Some modifications were made in the claims, which were intended to make them conform, as was alleged, to the decisions of the courts, but which, Mr. Gibson asserts, really broadened them, and the patent was reissued. Suit was not again brought against Mr. Gibson, but it was brought against other manufacturers. In the first suit the patentees were successful, but in the second they were beaten.

Mr. Gibson does not wish to oppose the general granting of patents, but he thinks that some measures should be taken to prevent the granting of them when no invention exists. (286-289.)

2. *Patent litigation.*—Mr. ELMER P. HOWE, member of the executive committee of the United Shoe Machinery Company, thinks that it would be a good thing if there could be legislation which would lessen the expense of patent litigation and hasten the decision. At the present time a person without considerable means can not afford either to prosecute or defend a patent suit. (489.)

3. *Copying of designs.*—Mr. GIBSON complains of the copying of designs. His practice is to produce original designs, with the help of designers, modelers, and chasers. He may go to an expense of \$500 in preparing to make a chandelier which will sell for \$20. Another manufacturer buys one of these chandeliers, copies it, and cuts the price. The original manufacturer is compelled to lower his price, though he may not have asked more than is just, considering the design-

ing and preparing of the patterns. One new establishment in Mr. Gibson's line has recently put out a catalogue of 180 pages, composed exclusively of cuts copied from the catalogues of other manufacturers. The law of copyright affords no protection against the imitation of designs, because the imitator could evade the law by making some little change in the pattern which the buyer might hardly be able to detect. (389, 390.)

II. GENERAL CONDITION OF LABOR.

A. General social conditions and progress of working classes.—

1. *General social conditions.*—Bishop POTTER declares that the problem of modern society is to prevent alienation and misapprehension of classes. With the growth of wealth, this is as great in a republic as in an empire. No one can fail to recognize the enormous contrast in social conditions between the present time and 50 or 75 years ago. In the smaller communities in which Bishop Potter's youth was spent, "if there was poverty it was recognized and known about, and the conditions under which it came about were known. If there was intemperance that was recognized; and the ne'er-do-well people were not left, as they are in modern life, to the experience of such profound indifference; and the distances between the top and bottom were so much less than they are to-day that the tendency was to help people mutually to understand one another. The mischief of the growth of wealth and luxury in a country like ours is that it practically destroys that condition." A large portion of the well-to-do people in our great metropolitan communities are as remote from other elements of the population as from the "people in the Philippine Islands or in Borneo—don't know any more about them; don't know how they live. The sad part of it is they do not want to know, as we do not enjoy hearing things painful to us. So, when issues between labor and capital come about, the element that is discreditable in it is the profound ignorance of intelligent people as to what brought them about." (2.)

Mr. Woods, head of the South End House, Boston, speaking of a tenement district of about 40,000 population in that city, says that about 2 per cent are loafers; 10 per cent casual and intermittent workers, 38 per cent unskilled laborers regularly employed, earning from \$1.50 to \$3 per day; 30 per cent mechanics and artisans, earning \$2.25 to \$3 per day; 27 per cent clerks and small shopkeepers, and 3 per cent belong to the professional and mercantile class. (199.)

2. *Influence of politicians.*—Mr. Woods says that the power of the local politician depends largely on the manipulation of social groups and organizations which he finds ready to his hand. It is one of the objects of university settlement work to take advantage of this instinct for organization and turn it into good and hopeful channels. To a very large extent, however, ward politics is based on economic needs. Young men of foreign nationalities and of different religious faith from the well-to-do find themselves hindered in a business career by certain prejudices. Often district machine politics offers the largest opportunity to the cleverest and most ambitious of them. Then there are a large number of men, mostly unskilled laborers, who want work in the city departments. There are the small jobbers and contractors who want to get work from the city. The small shopkeepers are dependent to a considerable extent for their patronage on the influence of the more powerful men in the district, who are usually the politicians. The various holders of liquor licenses, peddlers' licenses, and so on are to a large extent dependent on the politicians. The loafer and semi criminal class must keep in touch with the local political organization, for they depend on it when they get into trouble. (199, 200.)

3. *Unskilled labor.*—Mr. WYCKOFF, assistant professor of political economy, Princeton University, states that soon after he graduated from college it was suggested to him that as a means of increasing his knowledge of social and economic questions he become a workingman for a period of months or a year or two. He accordingly undertook to earn his living as an unskilled laborer, and continued the experiment from the latter part of 1891 to the early part of 1893. He determined not to beg, but to rely entirely upon his ability to earn a living by the work of his hands. His plan was, further, not to depend upon small temporary jobs for the earning of meals and lodging, but to accept a job of a more or less permanent sort, work at it until he had saved a little money, and then walk through the country until his savings were exhausted. He traveled in this way from Connecticut to San Francisco, except that he rode on the railroad through some of the very thinly populated parts of the far West. (181-197.)

Mr. WYCKOFF says that in the course of his experiment he never found an employment, except possibly in one or two cases, which did not offer means of improving his position. For instance, when he worked as a hotel porter for \$3 a

month and his keep, and often worked 16 hours out of the 24, he found a chance of securing a position as assistant gardener, with a great improvement of position and wages. When he worked in a logging camp in Pennsylvania, he was at first at a great disadvantage because of his absolute lack of experience in the woods; but as soon as the boss found that Mr. Wyckoff was capable of giving him help in some simple matters of record and reckoning, such as keeping track of the loads of bark that went to the tannery and the number of pounds in each load, he offered to keep him and give him a much better position. The work in question was not a matter of skilled bookkeeping; it involved nothing more than a knowledge of elementary arithmetic, such as any boy with a few years' training in the public schools should have. Again, while Mr. Wyckoff was at work in the Chicago factory he constantly saw men who entered the place as unskilled laborers advanced to positions of advantage as soon as they showed any capacity for the piecework system which was in vogue there. He constantly noted the anxiety of employers to discover any special ability in their hands. Mr. Wyckoff feels justified in making two generalizations: First, no man who is willing to work at any honest employment and is not bound down to any one locality, but is free to go out into the country and look for work, need long look fruitlessly for employment; second, every form of employment which Mr. Wyckoff secured as an unskilled laborer opened the way to a better position. (183, 184.)

Mr. Wyckoff says that he found it impossible to keep his notes closely during the period of actual employment, because the strain of manual labor was such that when the day's work was done he was physically unfit for any further effort, even mental effort. He adds, however, that this was probably due in a large measure to his being wholly unaccustomed to manual labor, and that if he had been accustomed to it he might not have found the strain quite so exhausting. (188.)

4. *Character and intelligence of workmen.*—Bishop POTTER declares, for himself and his associates on the Board of Mediation and Conciliation, of New York, "that we have found our relations to workmen a daily education to us; that we have found in them a degree of intelligence, and especially an instinct of fairness, with which they are rarely credited; a disposition to be careful about statements of fact, and to recognize the tendencies of exaggeration among their own number, and to assist us—assist me, particularly—in my relations with them in reaching conclusions, by making sacrifices." Bishop Potter finds that the workmen are usually disposed to make a concession if they see that it will be met with a concession on the other side. They do not maintain their demands with unreasonable rigidity. (3.)

Bishop Potter refers to the strike of the marble workers of New York City, which he was instrumental in settling. The working of marble is, in his judgment, a low type of industry, requiring little intelligence; yet the intelligence of the men engaged in it, or of those who spoke for them, was interesting and encouraging. There were Italians, Germans, Irishmen, and Americans; but there was no choice as to the clearness of their statements or their readiness to consider points in opposition, or their apparent capacity to do so. (4.)

Bishop Potter spent some 6 weeks, 3 or 4 years ago, in a community house of the Episcopal Church in Stanton street, New York. He devoted a large part of each day and evening to receiving anybody who wanted to come to him about any conceivable trouble. He had all kinds of visitors, with all kinds of sorrows, troubles, and shames; but, though there was a great deal of poverty all about and many factories in the neighborhood were shut down, and though he was asked for all kinds of comfort and sympathy, he was never asked for money, directly or indirectly. "What are you going to think about people who are of as fine fiber as that, the most redeemable quality in our social order? They have just the same sympathies, character, and purity and self-respect and chastity and honor as you and I have." (5.)

5. *Character of farmers.*—Mr. WYCKOFF, speaking upon the basis of his experience as a farm laborer, in the course of his experiment in earning a living by unskilled work, declares that he came out of his experiment with the very highest regard for our farmers. The standards of intelligence, the standards of morality, the standards of patriotism among them, seemed to him very remarkable. In numbers of instances he lived and worked in the homes of farmers, where he was most strongly impressed with the high, intellectual, and entirely exemplary character of the whole family life. Throughout the Northwest he found large numbers of New England farmers who seemed to him to preserve the very best traditions of New England. (187, 185.)

Mr. Wyckoff came to know many farmers who were deeply interested in the free coinage of silver, and gained a knowledge at first hand of their views. When, during the campaign of 1896, he read in the Eastern papers that the silver move-

ment was essentially dishonest, and that the farmers were trying to pay off their debts at 50 cents on the dollar, he resented that imputation very strongly. It was exceedingly unfair. "However wrong the men may have been, as a question of finance, they were not at all wrong in looking at the matter from their point of view as producers, because it is indisputable that from 1873 down to that year of 1892, and for 4 or 5 years after, there had been a steady decline in prices." Suppose one borrowed \$1,000 when he was getting \$1 a bushel for wheat. Suppose wheat went down to 50 cents before he paid the debt. When the debt was contracted it was equivalent to 1,000 bushels of wheat; when the time came to pay, the debtor had to raise 2,000 bushels to meet it. It seemed to the farmers that the fall in prices resulted from a shrinkage in the volume of currency, brought about by the creditor class, which was interested in increasing the value of the currency. Many of them conceded that the currency had increased in volume, but contended that the increase had not kept pace with the increase of commercial need. Mr. Wyckoff thinks that if there had been more instruction, of a careful, systematic kind, in the elements of finance, many of these very intelligent farmers would have regarded the matter in a very different way. Yet it seems to him that there was a great deal to justify their views. (197.)

6. *Religious attitude of workmen.*—Mr. WYCKOFF says that, excepting in the country, the working people of Protestant antecedents seem largely to have drifted away from religious influences. When he went to church in a country community, he found the farmers and the agricultural laborers there, with their wives and children. But in the city, if he went as a workingman to a Protestant Church, he very rarely found other workmen there. On the other hand, if he went to a Roman Catholic Church he found wage-earners overwhelmingly predominant. The Roman Catholic Church seems to be the only one which has retained its hold upon the laboring classes, excepting in the country communities. (194.)

7. *Intoxicating liquor.*—Mr. Woods says that poverty and drink are each a cause of the other, but he believes that the drinking of mature men in the tenement-house districts is largely the result of the weakening influences to which they were subjected and the depraved habits which they acquired while they were children. The weakening of vitality and character almost inevitably leads to drink.

Mr. Woods thinks that as more and more restrictions are placed on the saloon, compelling it to be open to the public view, etc., the tendency of the saloon to be a workmen's club decreases. Indeed, some saloons in Boston display prominent signs forbidding loafing. (200.)

Mr. WILLOUGHBY, of the United States Department of Labor, has not seen, as a matter of personal observation, as much drunkenness in Europe as in the United States; but all the evidence shows that in France drunkenness is increasing greatly among workmen, on account of their giving up wine drinking for the drinking of absinthe and similar liquors. (170.)

8. *Standard of living.*—Mr. WYCKOFF says that in the course of his experiment as an unskilled laborer his experience of the conditions of life of the workmen among whom he was thrown was uniformly satisfactory. He lived for the most part in mechanics' boarding houses with other workmen. The houses were good, the beds were good, and the food was uniformly good. It often happened that the woman who kept the boarding house had been out at service before her marriage, and so had acquired some exceptional knowledge of cooking. His common experience was to have meat three times a day; indeed, the workmen seemed to demand this as their right. While he worked in the factory in Chicago he lived in a boarding house opposite. For breakfast he had porridge, meat, a vegetable, and coffee, all very well prepared, and excellent bread; for dinner at noon there was first a steaming bowl of soup, then a roast, two or three vegetables, with abundance of bread, and then a dessert, either pie or pudding; in the evening there was cold meat, a hot vegetable, with an abundance of bread, and some sort of preserved fruit. For all this the price was \$4.25 a week. Mr. Wyckoff did not find the cooking so uniformly good on the farms as in mechanics' boarding houses, and did not find the variety of food so great. The bread was not nearly so good, and particularly the pastry was not nearly so good. It was not an infrequent thing to find much of the food fried; pork or bacon, with potatoes fried in the fat of the pork. (192, 193.)

Mr. Woods says, speaking particularly of the people among whom he works, that the generation which is coming upon the scene has higher standards than the old generation. In many cases the young men avoid the saloon; not that they are total abstainers, but they consider themselves above the low saloon. They have acquired a certain self-respect and certain social standards, partly, perhaps, as a result of being in the public schools and partly as a result of belonging to social organizations connected with settlement houses and similar institutions. (204.)

XCIV INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

9. *American and European workmen compared.*—Mr. HARRAH, president of the Midvale Steel Company, says that the reason why manufacturing can be done more cheaply here than abroad is not to be found in the superiority of tools or of brain power, but simply in the superior energy of the American. People do not work as hard in Europe as we do. The men are allowed more time to do things. They have a much easier life. He does not think that our superiority is due to advantages in raw material and fuel, because the price of fuel and ore is not fixed by the geographical location of the mines, but by the railroad companies. (354, 355.)

Mr. JACOB WEIDMANN, of the Silk Dyeing Company of Paterson, N. J., says that foreign workmen who come to this country become more efficient after they have been here a short time, and in 5 or 10 years a foreign silk dyer will turn out a third more work than when he first came to this country, and will be as efficient as any workman in the mills. (704.)

Mr. LINCOLN GODFREY, president of the Eddystone Manufacturing Company, says that in this country a man would turn off 125 pieces of cotton prints in the same time in which the same man would turn off only 100 pieces in Europe, under the conditions that exist there. (478.)

Mr. STEEL, a manufacturer of worsted and woolen goods, who has had experience both in America and in England, thinks that the capability of the English working people in his line is superior to that of the American. The reason is, in his judgment, that on account of the surplus of good labor in England, the manufacturers can be more exacting and compel them to do their work carefully and properly; here that is scarcely possible. (237.)

10. *American and European conditions compared.*—Mr. WILLOUGHBY says that the conditions of labor are undoubtedly better here than in any European country. There are exceptions, however. "For instance, I believe the coal miners are better off in Europe than they are in the United States. I think their actual conditions of living there are better. They are probably better housed; they probably eat better, and they are certainly very much better off as regards stability of employment."

In the glass and iron industries our conditions compare very favorably, at least with those of continental Europe, but though the British workmen in the steel trade do not earn as high wages as ours, they are very well off. "They have more constant work; through various relief organizations they are better taken care of, and their requirements are not so great as they are here." The great advantage of the European workman generally is that the conditions of his life are more certain. The German, for instance, whatever his condition may be in comparison with the American, "knows that if he meets with an accident incapacitating him for work he is going to receive a pension for the remainder of his life; that if he is killed there is going to be a compensation paid to his wife and children; that if he falls sick he is going to receive compensation also; and finally, when he gets unable to work as a result of old age that he will be then entitled to a pension—these are advantages that the American workman does not enjoy."

The American workman, on account of his higher wages, may make provision against those conditions, and to a certain extent he does so. But the person who is most in need of provision, the common laborer, does not. (479, 480.)

Mr. STEEL, who has paid some attention to the cost of living in England and America, believes that the cost of living generally is somewhat lower there, but among working people is almost as high as here. The prices of food are, if anything, higher there. The only articles which he discovered that were cheaper than in this country were potatoes. "But they live fairly well over there; they do not consume a great deal of meat; their food is more of the character of cereals—bread and things of that kind." Working people do not live in separate houses, but in rooms. They generally have gas, but do not ordinarily have bathrooms. For heating they depend almost entirely on open fires. As to clothing, prices are somewhat lower in Great Britain, but not, Mr. Steel thinks, very much lower. His impression is that the profits of retailers are greater there than here. There is no other country in which the ready-made clothing business is so developed as in the United States, nor where ready-made garments are so well made, either in point of workmanship or as to style and general character. Mr. Steel believes that these goods are sold to consumers as cheaply as the product of ordinary tailors in England. There it is necessary to depend almost entirely on tailors. (388, 393.)

Mr. WEIDMANN says that workmen can live more cheaply in this country than abroad. Some of his foreign-born employees have kept a record and have found that living is cheaper in this country. (707.)

11. *Housing of working classes.*—(a) *New York.*—Bishop POTTER considers that the elevation of the working classes depends largely on the condition of their homes. There has been a noticeable improvement in this respect in New York within 10

years, and still more within 20 years. The legislation for improving the homes of the poor has been judicious and wholesome upon the whole, and has been fairly well enforced, though the enforcement of it brings up the question of an efficient police system. The disposition of capitalists to build improved tenement houses is increasing noticeably, and the experiments in this direction have on the whole been encouraging and reassuring, yet the movement lags far behind the position it should have reached. It seems to be one of the defects of the trade unions that they have given no attention to this subject. It has not yet been possible to interest small shareholders in the building of improved tenement houses. This is most unfortunate. Model tenement houses ought to be built by the people and not for them.

Bishop Potter believes that the tenements of New York are not owned to a great extent by the large owners of real estate. He believes that they prefer a higher grade of property. Tenement property is troublesome and needs constant vigilance. The witness thinks it is owned considerably by Hebrews and by people who are not of great wealth. His knowledge, however, is not definite.

The problem of decent housing is partly a problem of the education of the people themselves. Many of the inhabitants of New York, coming to us with Eastern ways and habits, have to be taught to use a Western house and Western conveniences. (5-7.)

Mr. REYNOLDS, head worker of the university settlement of New York City, says that the condition of tenement houses in New York has improved, on the whole, during the past 10 or 15 years. The older tenement houses were buildings which had formerly been occupied by single families. When such a house is turned into a tenement there are always dark rooms and unsatisfactory sanitation. The requirements of the building department as to air space, and those of the board of health as to light, are much less adequately enforced with respect to old houses than with respect to new. On the lower West side, in the old houses with rotten woodwork and defective plumbing, the prevailing disease is typhoid or typhus; on the East side, where the evil is lack of light, the prevailing disease is tuberculosis. (87.)

Mr. Reynolds says that in a special investigation of the relations between landlords and tenants in the tenement-house districts of New York, in which he was engaged, it was learned that the landlords calculate that a given apartment will be occupied, on an average, 10 months in the year, and that they base their scale of rents on 10 months' occupancy. When a tenant goes into a new place he has to make a deposit. He stays a certain number of months, and when he gets ready to leave he lets the rent go as long as the landlord will let it go and economizes and saves and is able to pay a month's rent in advance at the next place. (87.)

(b) *Philadelphia*.—Mrs. SYMONDS, labor editor of the *Philadelphia Inquirer*, says that she spent her childhood and young womanhood in the neighborhood which is now the slum district of Philadelphia. The present tenement-house conditions did not then exist there. They have come in with the Russian and Italian immigration. The majority of the houses are old dwellings which are entirely unsuited for the purpose of tenement houses, to which they are now put. Apartment houses on the New York plan are beginning to be built. Even in them the conditions are bad. Though the houses are not deep, 2 families are put on a floor; the rooms are very small, and the water and toilet conveniences are in the hall. (261, 262, 266.)

Mr. FOLWELL, a woolen manufacturer of Philadelphia, states that working people of the class employed by him live in 2 and 3 story houses, of brick, with bath-rooms and hot and cold water. The smaller houses contain from 5 to 7 rooms and the larger from 10 to 12. The rent is from \$12 to \$20 a month. The houses are habitually occupied by single families. (215.)

Mr. CRESSON, a manufacturer of transmission machinery, mentions as reasons why more working people own their homes in Philadelphia than in other cities the cheapness of ground and of building, and the good transportation facilities. The building and loan associations have also helped. Mr. Cresson thinks it a good thing for a boy to be brought up in his father's house. If a man owns a house he will take care of it and teach the boys to do the same. But it is cheaper to rent than to buy. (271.)

(c) *Boston*.—Mr. WOODS gives some results of an investigation of a tenement district of about 40,000 population in Boston. It was found that fully one-half of the population live in apartments of from 1 to 4 rooms for each family; one-fifth live in tenements and apartments of a higher grade, and nearly all the remainder live in lodging houses. Less than 100 families in the district have entire houses to themselves.

Many of the tenement houses were formerly residences of well-to-do citizens. When they are made to serve for 2, 3, or 4 times as many people as they were meant

for, the bathing facilities and the water-closet facilities are very inadequate. Where houses have been specially built as tenement houses, the evils of the ventilating shaft and the dark inside room appears. In an investigation of this district made by the Massachusetts Bureau of Statistics of Labor some 9 years ago, it was concluded that 25 per cent of the houses were positively objectionable from a sanitary point of view. Within the last few years a large number of the most insanitary buildings have been destroyed by order of the board of health. At present the restrictions in Massachusetts upon the building of new tenement houses are adequate and effectual, but it often happens that under the pretext of repairing an old house a practically new tenement house is constructed under conditions which would not be allowed except for this pretext. (198.)

Mr. Woods says that rent is a rather higher item in Boston than in most other American cities, except New York. Often more than one-fourth of the family income of the poor goes for rent. About one-half goes for food. This leaves one-fourth for clothing, furniture, recreation, support of religion, etc. The spirit of enterprise and self-respect often leads people to sacrifice food for the sake of clothing and furniture, and perhaps to secure an extra room in which to receive friends. "People familiar with working-class life abroad, who see our working classes and see the way they dress, are always misled as to the grade of income on which they are." (199.)

(d) *Fall River*.—Mr. THOMAS O'DONNELL, secretary of the Fall River Mule Spinners' Association, says that factory tenements are gradually disappearing from Fall River. There is no need now for mill owners to build tenements for their operatives, as there are plenty of tenements in the city. The tenements built now are more modern than those built by the mill companies 25 years ago. Many of the operatives, however, are compelled to live in the poor tenements because of their small earnings. The rents of the factory tenements vary from \$1.50 a week up. For other tenements, built in a more modern way, the rental is from \$10 to \$14 per month. Many of the mill operatives own their own homes. The cooperative banks have, to a great extent, assisted them in obtaining homes. (566, 567.)

(e) *Europe*.—Mr. BLAUSTEIN, superintendent of the Educational Alliance of New York City, refers to model tenement houses in Frankfurt on the Main, which have been built by private individuals under arrangements which give them 4 per cent on their money, and turn all the rest of the income into a sinking fund for improvements. This fund is managed by trustees. The occupants of the houses exercise a control over the property and have a feeling of ownership in it. (137.)

12. *Discontent among working classes*.—Mr. WYCKOFF says that during his experiment as an unskilled laborer in Chicago he made it a point to attend as many meetings of the revolutionary classes, socialists and anarchists, as he could, and to come to personal acquaintance with their leaders. He found that Germans and Polish Jews were to be found in the largest numbers among socialists and anarchists in Chicago, but that all nationalities were represented. The majority of the men of revolutionary opinions were foreign born and of comparatively recent immigration. They were not largely professional agitators, but were almost exclusively working people, and largely of the skilled-artisan class. It seemed to him, however, that while there were industrious workmen among them, the majority of the rank and file were not thrifty, were not good workmen, but were men who did not keep their jobs very long.

Mr. Wyckoff did not find the socialists at all destructive in their opinions. Their views are rather evolutionary. They believe that the processes of social evolution are all working in the direction of the collectivist order of society, as contrasted with the individualist order. They have two very definite objects in view: The first is to form a political organization which they hope will extend until it will embrace a sufficient number of voters to gain political control; the second object, to which this is preliminary, is to use political control to reorganize industry, by substituting for private property in the instruments of production collective ownership of them. They anticipate no revolution in bringing this about, but they regard the progress of centralization and the organization of capital as preparing society for the final collectivist organization. There are many men among the socialists who believe in socialism as in a religion, and who try to make themselves centers of missionary influence. Their discussions, however, are not based upon simple discontent, but are rather discussions of principle. Mr. Wyckoff did not hear among them much violent hostility to any class. They constantly contrasted the capitalistic class and the wage-earning class, but he heard no violent speeches against the capitalistic class. They seemed to regard it, as well as the proletariat, as the result of evolution. They considered that the capitalists were not themselves to blame for the condition of things. The class

was looked on as tyrannously appropriating the values created by the wage-earning class; yet it was not spoken of with hostility, but rather in the way of a theoretical accounting for an economic condition which is a part of the evolutionary development. There would be frequent admissions that there are many capitalists who as individuals are good men, and that the capitalistic class represents a necessary phase of evolution.

On the other hand, Mr. Wyckoff has the feeling that among the anarchists there is a strong hostility to the capitalistic class, and that many, especially of those who call themselves communistic anarchists, believe in the violent overthrow of the present organization of society. (188, 195, 196.)

13. *Saving by workmen.*—Mr. WYCKOFF says that he always found it possible to save money out of the wages he received as an unskilled laborer. His plan did not enable him to learn what a man could save by sticking to one employment, say for a whole year. As soon as he had worked a few weeks in one place he gave up his job and spent his savings in walking through the country; but he never found it impossible to make savings, and often he was able to lay by a large part of his wages. He gives details of his earnings and the cost of board. (173-189.)

Mr. Woods says: "A family which manages to put by something is likely to rise in the scale, and a family not putting anything by is in all probability tending downward." An important feature of the work of the South End House is the encouragement of thrift. One of the workers, a young woman, goes about to the factories of the district, especially those where young women are employed, and collects their savings. (199, 203.)

Bishop POTTER says that the foreigners who come to New York, and who are accustomed to lower planes of living, are very thrifty, and that the savings bank exerts a most conservative influence over them. Though they may be anarchistic or revolutionary in their tendencies, they cease to be destructive as soon as they have some money in the bank. (5.)

14. *City and country.—Respective advantages.*—Mr. WYCKOFF considers that for men of skilled trades it is on the whole better—better for their trade and better for the interest of their class—to be under conditions which admit of their being members of trade unions, and adding their personal strength to the strength of the union. For them, therefore, he seems to consider city conditions more favorable. But for unskilled laborers, in the present conditions of employment in this country, he considers it far better to be in the country than in the large industrial centers. (193.)

15. *Chinese labor.*—Mr. WYCKOFF states that in working his way from Los Angeles to San Francisco in the early part of 1893 he was effectually cut off from the possibility of finding employment on the railways by the presence of Chinese labor. He observed no mixed gangs of Chinese and Americans. (192.)

16. *Negro labor.*—Mr. HARRAH, president of the Midvale Steel Company, says that among the 8,400 employees of this company there are 800 or 1,000 colored men. They are not men bred in Philadelphia. Philadelphia colored men are accustomed to be waiters, cooks, and the like. The steel company gets its men from Virginia. They are men of strong physique, intelligent and docile. While they begin as unskilled laborers, they gradually become skilled. There is no drinking among them, and there is no friction between them and the white workers. (353.)

Mr. HIXEY, commissioner of labor statistics, Missouri, says that there are no factories in that State run wholly by colored labor, and that there are very few colored workers in the mechanical arts. Almost all the colored wage workers are engaged in domestic work, or in such work as that of porters. (74.)

B. Agencies for betterment of social conditions.—1. *Legislative remedies.*—Bishop POTTER has little faith in legislation as a remedy for social evils. He believes that we have too many laws rather than too few. Yet he would except "all law which involves the turning on of the light," such as factory-inspection laws and those which relate to the sweat shops. (11.)

2. *Extension of municipal functions.*—Mr. Woods says that Boston now has public playgrounds, public baths and public gymnasiums. There are swimming baths for the summer in each great district, and there is one public all-the-year-round bath, with accommodations for 50 bathers and with separate departments for men and women. The number of baths taken is about 300,000 a year. There is soon to be established in Boston a workingmen's institute, to be provided by the Franklin fund, the accumulation of a small bequest left by Benjamin Franklin a hundred years ago. The institute will be in part devoted to mechanical and technical education for artisans and mechanics already engaged in their trades, and in part a general social center for workingmen. Mr. Woods believes that such work as this on the part of the city is in the end an economy; that there will be a

saving in the police department, in the prison department, in the almshouse department, and in the hospital department. (202.)

8. *Social settlements.*—Bishop PORTER says that the college settlement grew originally out of the desire of college men in England to get closer to the laboring classes. The first was Oxford House, in London, founded by a number of Oxford men who went and lived in the slums and interested themselves in the social recreations of the people. Next was Toynbee Hall. The success of these movements led to the establishment of similar settlements in New York, Chicago, Boston, and other American cities. Young men give a month or 2 months or 3 months to this work, living in community in the settlements. One of the advantages of these organizations is that they give an opportunity for humanitarian work to persons who would be embarrassed if it were necessary to take it up under distinctly ecclesiastical auspices. (8, 9.)

Mr. REYNOLDS, head worker of the University Settlement Society, New York, says that this society is a voluntary organization, composed of people who make annual contributions of \$5, \$25, or \$100 a year to support the work done by the University Settlement. The object of the society is to bring together people of the laboring class and the wealthier class, to compare ideas regarding the conditions of society, and to work together for the amelioration of conditions, especially in the poorer quarters of New York. The lines of work which the society takes up may be divided into two classes. First, investigation into the social conditions of the quarter in which the settlement is situated; for instance, special investigations have been made as to the condition of the unemployed, relations between landlord and tenant, the conditions of women workers, and pawn shops. The second purpose is to provide an opportunity for the people of the district to improve themselves mentally, morally, and socially. The society has two settlements, one on the lower East side, in a district peopled mainly by Russian, Polish, and Roman Jews, and the second on the lower West side, in an Italian quarter. The latter has just been established; the former has existed 14 years.

The work of the settlement is carried on chiefly by men living in the houses. In the older settlement at Eldridge street there are generally 8 or 10 men. They are usually, but not always, college graduates. They live there at their own expense, paying a regular price for room and board, and taking part in the work of the house. There are also 40 or 50 nonresident workers or day visitors. They, for the most part, are not college graduates.

The settlement has a kindergarten for the youngest children, between the ages of 5 and 7. It has clubs for older boys and girls, organized primarily for social purposes, and secondarily for educational and moral purposes. Each club has a director, a young man or a young woman. The position of the director is, however, that of an adviser, rather than of a governor or teacher. He is present at the weekly meetings of the club, but the club elects its own officers, and the responsibility of good order is put upon the children themselves. The director oftener finds it necessary to interfere in the interest of moderation than in the interest of severe discipline. The children are only too willing to punish. These children's clubs meet in the afternoon; in the evening there are clubs of older persons.

The settlement has a children's penny provident bank, with a membership at present of about 4,000 children. Deposits are held without interest and repaid on demand. There is a library with a membership of 1,100 or 1,200. There are concerts, music classes, musical and dramatic entertainments. There are some simple industrial classes in cooking, business arithmetic, stenography, dressmaking, etc. Five-cent baths are provided. There is a gymnasium on the ground floor and a roof garden on the top. Summer outings are organized. There is a summer home for girls and a summer camp for boys. Probably a little more than half of the people who use the building are less than 21 years of age.

In addition to the direct activities of the settlement itself, valuable work is done by other organizations which occupy parts of the settlement's building as tenants. The Provident Loan Association, a model pawn shop, has a branch there. The Legal Aid Society has an office there. The Central Federated Union, the central labor body of the city, meets there, and so do several trade unions. The number of persons who use the Eldridge street building, in one way or another, is about 6,000 weekly. The difficulty now is to find accommodations for societies and organizations which wish to use the rooms.

While the elevation of the moral tone of the community is one of the chief objects of the society, the question of religion does not enter into it. The settlement is supported by Protestants, Catholics, and Jews. (78-82.)

Mr. WOODS, the head of the South End House, Boston, states that this is a college settlement established about 9 years ago. There are at present 7 men in residence, and at another house 3 women. There are, besides, about 30 men and women

who do not live on the ground, but come usually once a week for some regular duty. The plan of the settlement is to assume the care of a definite district or parish with a population of about 6,000. In this neighborhood the effort is made to have some center of influence in every block; that is, there is one house where the young women live, another house where the young men live, another house where there is a workmen's reading room and a kindergarten and a manual-training shop. Then there are small libraries of 15 or 20 books each, deposited in tenement homes; a dozen boys and girls living in the court or alley where a library is established become members of it. One of the workers attends once a week and gives out books, and talks with the children, and visits their families. Another worker, a young woman, goes about among the factories of the district, particularly those where young women work, and collects their savings. In this way she comes into personal relations with them. There is an ascending scale of little clubs and classes, beginning with the kindergarten and going on to boys and girls and young men and young women. The settlement tries to cooperate with all forms of charitable, philanthropic, and educational work in the district. It forms the link or connection between the public schools and the homes of the children. It comes into active touch with the leaders of the labor organizations.

The object of the college or university settlement is to place in a poor and crowded district a group of young men or young men and young women who shall, so far as possible, identify themselves with the life of their district. They are supposed to be young persons who have been trained in college in some branches of social science, and they go there with the double object of studying the situation and of doing all that they can for improving the conditions which they find. In their work for social improvement they strive, above all, to work with the people of the district and to incite self-help and mutual aid among people just as far as possible. (198, 203.)

4. *Educational Alliance.*—Mr. BLAUSTEIN, superintendent of the Educational Alliance of New York, says that this institution has existed since 1891. It does work very similar to that of the social settlements, but it is not a social settlement, because it has no resident workers. Its work is chiefly among the Jews, and it is supported chiefly by Jews; but it makes no distinction of race or religion. If one who is not a Jew applies for admission into a class or a club, or wishes to draw books from the library, or wishes to attend the gymnasium, no questions are asked. There are even colored people in the classes. The institution was formerly called the Hebrew Institute. The name was changed to get rid of the appearance of sectarianism.

The work is chiefly among comparatively recent immigrants and their children. There are morning classes for children of school age who do not attend the public schools, especially recent arrivals who have not learned English. They are prepared for the public schools and sent there as fast as possible. It is attempted to exert a moral influence over them and to teach them habits of cleanliness. There are baths and there is a barber attached to the institution.

There are also morning classes of graduates of the public schools who want to prepare themselves for office work. There is a kindergarten class for children from 3 years old upward who are too young to be admitted to the public kindergartens. These are largely children both of whose parents work. In the afternoon, from 4 to 7, there are classes for children who attend the public schools. The most of these come for religious instruction. The attempt is made to stop the gap between the rising and the passing generation. The greatest stress is laid on the ethical part of religion, but children are taught to respect their traditions and to respect their parents. There are also industrial classes for girls—sewing, millinery, dressmaking, and cooking. There are gymnasium classes for both girls and boys. There are literary clubs for both boys and girls, meeting in the afternoon. A special effort is made to teach the children the history of the city of New York.

The most important part of the work is the evening work. Then the adults who work in factories or in stores or in the sweat shops come. Some of them can not come before 9 o'clock; so classes are arranged to begin as late as 9, and the building is open till 11. At any given time, not less than 1,000 people may be found in the building.

Besides the classes and clubs, there is in the building a branch of the Penny Provident Fund, with as many as 18,000 depositors. There is a branch of the Aguilar Free Library, a library supported mostly by Jewish people, whose books and magazines are selected especially for the immigrants. There are books in Hebrew, in Russian, and in Yiddish.

There are also classes which do not lead to any particular end; classes in literature, history, economics, constitutional history, music, and art. "The people of the East Side are very eager to know everything."

On Saturday the building is closed for secular work, and there are religious

C INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

services, both for the older people, with prayers in Hebrew and addresses in German on topics of the day, and for children, mostly in English. On Saturday evening the building is devoted chiefly to recreation. There are dramatic entertainments which are meant to be of an elevating character and to counteract the demoralizing influence of the three regular Jewish theaters in the city. On Sunday there are no regular classes, but there is social work.

A special point is made of celebrating all legal holidays and of teaching the people the meaning of them. Special efforts are made to instruct the people in American geography and in facts about the different States. It is hoped in this way to encourage scattering from New York into interior States. (114-118.)

5. *Provident Loan Association.*—Mr. REYNOLDS says that the pawn shop is the only means by which money can be raised under any circumstances in the lower part of New York City. The regular rate of interest charged by pawn shops is 3 per cent a month for the first 6 months and 2 per cent a month for the second 6 months, making 30 per cent per annum. The Provident Loan Association has been organized, partly on philanthropic grounds, to furnish loans at 1 per cent a month. At this rate it has been found possible to return an interest of 5 or 6 per cent on the investment. The branch office, established in the building of the University Settlement, did a business of \$500,000 the first year in loans which usually did not amount to more than \$5 or \$10 at the outside. Ninety-eight per cent of the articles pawned the first year were redeemed, as against from 70 to 80 per cent in the average pawn shop. It does not appear to be true that ordinary pawnbrokers desire to get the articles. They unanimously state that when they have to take articles they generally lose. They are willing to loan more when they think the loan is likely to be repaid than when they think it will not be. Since the rate of interest is high, they like to loan as much as they think they can loan safely. One reason for the smaller proportion of unredeemed pledges in the experience of the Provident Loan Association is that it is rather more conservative in its methods than the ordinary pawn shops. (79, 80.)

6. *Legal Aid Society.*—Mr. REYNOLDS states that the Legal Aid Society is a philanthropic organization established to provide free legal counsel for the poor. The branch established at the university settlement has one salaried lawyer regularly employed. Two residents of the building give a certain amount of their time to the work without pay. A charge is made of 10 cents for the registration of a case. If suit is brought and money is recovered a certain per cent is paid to the society. If there is no recovery there is no charge. Advice is given gratuitously. The society is careful not to interfere when there is no reason why an ordinary lawyer should not be employed. Most of the contributors to the society are lawyers. The society was established partly because poverty prevents so many from resisting injustice through the law and partly because the legal counsel that is given in the poorer quarters tends so largely to encourage rather than to discourage litigation. (80, 81.)

C. *Relations of employers and employees.*—1. *Generally.*—Bishop POTTER thinks he observes a distinct improvement in the disposition of employers to recognize the rights of their employees. Moreover, he believes that the fraternal instinct is widely diffused in the minds of employers all over the world. He does not think that the popular mind does justice to the growth of this feeling. The great enemy of good is ignorance. People are ready to take hold of instrumentalities for bettering the relations between the classes as soon as they realize the need. (4, 6.)

Mr. FRANK W. CHENEY, a silk manufacturer, says that if a manufacturing enterprise is to get on successfully, there must be cooperation and mutual confidence between employers and employees. If any conditions exist in the mills of Cheney Brothers which are unsatisfactory to the employees, they mention the fact to the company and the matter is gone over in a friendly way. (733, 734.)

Mr. HARRAH, president of the Midvale Steel Company, says that the Baldwin Locomotive Works must treat their men very kindly, because when work is slack with them many come to the Midvale Steel Works, but when work picks up at Baldwin's the men leave the Midvale and go back there, even though they may be getting big wages. Mr. HARRAH declares that his own policy and desire is to make his works attractive to the men, for selfish reasons. One invests a great deal of money in the education of a man. It is necessary to be patient with him, to explain things to him, and to let him waste a quantity of material while he is in training. When he is thoroughly educated, the works can not afford to lose him. In 1894 and 1895 and 1896 Mr. HARRAH took contract after contract which brought no profit, and some which involved a loss, simply to keep the men together and enable them to support their families in comfort. It was not a philanthropic measure, however, but a measure of business; and when good times came the company got its reward. (350, 351.)

2. *Model towns.*—Mr. NELSON, president of the N. O. Nelson Manufacturing Company, refers to the beautification of factories and their surroundings, and the provision of dining and rest rooms and of lecture courses and libraries for employees; a series of provisions which, as he says, are sometimes designated by the name of social betterment. These things cost some money, and to this extent may be regarded as a form of profit sharing.

Mr. Nelson refers to his own model village of Leclaire, Ill., laid out on a tract of 125 acres of land 18 miles from St. Louis. The village is provided with well-made and tree-lined roads, with a bowling alley and a billiard room and a clubhouse for single men, with a room for evening gatherings, and a lecture and dance hall, which, by the aid of sliding partitions, is used also for a schoolhouse. There is a greenhouse which provides flowers for the public grounds and gives them away to such as will set them out in their yards. The company has its own electric-light plant for lighting the factory and the village, and its water plant. It has built cottages of from three to six rooms and sold them on easy terms to such employees as have wished to buy. It provides lawn mowers for everybody's use, and if anyone wants more garden room than he has on his own lot, he can have all he wants, already plowed, on the adjacent farm. At the start scarcely any of the people made gardens or planted flowers; they did not know how to do it or care for it. By infectious example they now all have gardens and handsome yards. "No resident has ever been asked to cut his grass, or go to church, or keep sober; mainly, I think, for that reason there has never been a fight, or a drunk, or any interference with a neighbor." There are a kindergarten and a primary school and a dancing class, and two or three reading clubs among the children. There is a lecture course every winter. Mr. Nelson has lived in the center of the village for 8 years, and he asserts that he never had better neighbors and that no more intelligent or better behaved children than those about him can be found anywhere. (361, 362.)

Mr. WILLOUGHBY speaks of the model villages and institutions which have been established in connection with the Krupp works at Essen, and adds that there is scarcely a large establishment in Europe where the employer does not provide institutions of one kind or another for the benefit of his employees. The reason why these things are so largely done in Europe and comparatively so little in America is, Mr. Willoughby thinks, the difference of mental attitude between the European laborer and the American. The American does not like to have things done for him. What he wants he wants as a right. The continental worker does not have this feeling. Mr. Willoughby refers, as an illustration, to the experience at Pullman. Even in continental Europe, however, some wise employers have adopted the policy of turning over their model institutions to their employees as fast as possible. Mr. Willoughby believes that even in this country the employers could, in many cases, encourage and foster the development of club houses, reading houses, and baths, and the organization of cooperative societies, either for managing stores or for building houses. But he should encourage the men to do these things rather than do them himself. (178.)

3. *Insurance of tools.*—Mr. WILLIAM C. REDFIELD, treasurer of J. H. Williams & Co., says that that company insures the tools of its employees against loss by fire or water, without charge, the consideration given being service in the fire department of the works. (658.)

4. *Advantages of fair treatment of employees.*—Mr. REDFIELD says that industrial betterment is not a matter of giving alms, but of doing justice. If a man is justly treated and well paid he will be a more economic producer, except where conditions make it impossible, than if he is ill treated. A justly treated man produces more than an unjustly treated one; a contented man is a better and cheaper producer than a discontented man. The fair treatment of employees by J. H. Williams & Co., has worked well. The company has lived through one panic, holding its working force together and not reducing the pay of any employee. It has stood the test of competition, for it has many rivals in the same industry. The company has won its success largely because it has paid high and continuous wages to its workmen, and has recognized thoroughly the intelligence and efficiency of its employees. (657, 660, 665.)

10. *Employment and unemployment.*—1. *Opportunities for employment.*—Mr. WYCKOFF is convinced by his own experience in earning his living as an unskilled laborer that no man in this country who is willing to work at any form of honest labor, and is not bound down to any one locality, but is free to go out into the country and look for work, need not long look fruitlessly for employment. He admits, however, that this statement does not apply to certain localities or to certain seasons of the year, and that it does not apply to those who are bound by family ties or otherwise to congested centers of population. In the great centers the army of the unemployed is a genuine phenomenon. (185-191.)

III INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

Mr. Wyckoff feels confident that the period of his experiment in working as an unskilled laborer, from 1891 to the early part of 1893, was a better time for such an experiment, because a more normal time, than the period following the panic of 1893. He believes that 1893 and 1894 were very abnormal years, and that 1891 and 1892 were much less so. He is convinced, however, that even in 1893 and 1894, he would still have found opportunities for work in the country much as he found them in the years in which he did carry on the experiment, because the work he got was of a kind for which there is always more or less demand, on the farms, in the logging camps, and on the railways. (192, 194.)

Mr. Wyckoff says that nothing surprised him more in connection with his early experience in rural districts and small towns in the eastern part of the country than the ease with which he found employment. He believes he never had to look for work more than a single day without finding it. He had the same experience in traveling west from Chicago to the Mississippi, up into Minnesota, down through Iowa, and on through Nebraska; and in California abundant opportunities for work were offered to him. He never had any trouble in getting work with farmers. His experience in this respect was entirely uniform, both in the East and in the West. A physician in southwestern Minnesota assured him that at the time when he was there, 30,000 men could have been put to work within a few neighboring counties. This, however, was the harvest season. But Mr. Wyckoff was assured by the testimony of numbers of farmers that the demand for men was so chronic among farmers in that region that they were more than willing to keep desirable men throughout the winter at a nominal wage in order to be assured of their services from the 1st of April to the end of November. During the period from April to November, the regular wages are \$20 a month and everything found, even including washing. For the few weeks of the harvest season it is easy for skilled men to get \$2.50 and \$3 a day.

Mr. Wyckoff adds, however, that so far as a large proportion of the unemployed in the cities are concerned, farm employment does not, on account of social considerations, present an opening for them. Except in the large ranches of California, Mr. Wyckoff did not find that farmers made provision in outbuildings for the accommodation of help; elsewhere it was the uniform practice of farmers with whom he came in contact to take their hired men into the house, have them eat at the family table, and make them members of the family. In numbers of instances Mr. Wyckoff was greatly impressed with the high intellectual and social tone of the family life of the farmers among whom he worked. Many of them in the Northwest seemed to preserve the very best traditions of New England. A large part of the unemployed in cities are unfitted by experience or training to be admitted into the life of such families. This may be said without raising the question of vicious habits. The recent immigrant, for instance, could not be admitted into families of the type of which Mr. Wyckoff speaks.

Yet, if such a thing were practicable, and so far as it is practicable, it would be of the greatest value in the assimilation of the immigrants, and in their social training and training for citizenship. There is no class among whom the foreigner could learn American institutions as he can among the farming class. The farmers are themselves intelligent and observant. They know American institutions and believe in them, and they would be able to impart their knowledge to foreign-born men as perhaps no other class in the country could. (186, 187, 195.)

Mr. Wyckoff found it more difficult to obtain employment in the larger towns and cities than in the country and the small towns. In Chicago, in the winter of 1891 and 1892, the supply of labor was in excess of the demand by many thousands of men. Mr. Wyckoff devoted 2 weeks to continuous effort before he was able to find employment. Then he got a place as a hand truckman in a factory at \$1.50 a day. The existence of a large army of unemployed and the pressure of competition among the men seeking employment did not seem to affect wages in the factory, and \$1.50 a day represented considerably more than the means of subsistence. Mr. Wyckoff got good board across the street from the factory at \$4.25 a week, and he was able to save almost the entire margin between \$4.25 a week and \$3.

The only other place where Mr. Wyckoff speaks of having found a large number of unemployed men is Cripple Creek, Colo. He reached Cripple Creek in the early days of mining there and found it impossible to get work. He went on from there to Creede, which was also in its early days, and again found it impossible to get work in the mines. He did get employment there, however, with a gang of men building a road, and he received there the highest wages that he ever had as an unskilled laborer—\$2.50 a day. (188, 189.)

2. *The unemployed. Classification.*—Professor COMMONS, of the Bureau of Economic Research, New York City, suggests that the unemployed should be divided into four classes: First, the able-bodied who are willing to work; second, the able

bodied who are unwilling to work; third, the totally incapable; fourth, those who are partially incapacitated. Each of these classes should have different treatment. (84.)

3. *Causes of unemployment.*—Professor COMMONS says that the most obvious cause of unemployment in this country is immigration. Some of the trade unions protect themselves by charging special initiation fees to foreigners. The union of stationary engineers has induced the State of New York to pass a law that engineers' licenses shall be granted only to citizens. (42, 43.)

Professor Commons says that the general tendency of modern industry, with its high pressure and its speeding up of machinery, is to increase the number of those who can not come up to the required standard of performance. A man who is "either physically, mentally, or morally weak, is less able to hold a job than ever before, and of course in a period of depression he is the first discharged. He is the man likely to get into intemperate and vagrant habits, and that number is necessarily increasing, owing to the pressure of modern industry, which in this country is higher than in other countries." The fixed standard wage rates of the trade unions increase the difficulties of the less efficient. Professor Commons mentions a lithographer in New York who is growing old and can no longer do a day's work on the basis of the union scale of \$25 a week. He could earn \$18 a week and would be glad to, but the union will not let him take less than the standard rate. So he will be discharged and become one of the unemployed. Provisions of law which fix maximum hours and minimum wages on public work tend in the same direction. They compel contractors on public works to be more careful about the men they employ and to work them harder. Some trade unions remedy this bad tendency of their standard wage rates by considering separately the cases of individual men, and permitting them to work at lower rates when it is clear that there is no subterfuge by which the scale itself may be broken. (37.)

Professor Commons points out, in considering statistics of unemployment of organized workmen in Great Britain, that there is regularly an increase of unemployment in the winter. Unemployment on account of the season can hardly be called unemployment, because men who are subject to such things can predict the lack of work and prepare for it. A seasonal worker, other things being equal, can secure higher wages when he is working, as an insurance against that unemployment which is sure to come. The case is entirely different with that unemployment which is due to fluctuations of business prosperity. It is this kind of unemployment which is the serious social problem. (35.)

Mr. HOURWICH says that the great cause of unemployment in 1893 was, of course, the industrial depression. The answers given by employers to the police of Chicago disclose a reduction in the working force of the establishments of about 40 per cent. Yet a certain amount of the unemployment was not attributable to any acute crisis. There are seasonal trades, for example, and the returns of the factory inspector showed that there were periods of unemployed time which could not be ascribed to the industrial crisis.

Drunkenness figured very little as a cause of unemployment. There were cases in which aid was refused on account of drunkenness or bad habits, but in Mr. Hourwich's belief they amounted to only about 1 per cent or less. (166, 167.)

Mr. WYCKOFF says that there is either a lack of knowledge among city laborers of opportunities in the country, or else there is unwillingness on the part of men who know of these opportunities to accept work in the country with the conditions of life there. He found in numbers of instances that men who knew from their own experience that they could get work in the country preferred the comparative destitution of chance employment in the city to the isolation and loneliness which attend the life of labor in the country. Mr. Wyckoff believes that with the rise of new communities and the growth of small communities into larger ones and the cheapening of the means of travel, so many city opportunities are being brought to places which were formerly isolated and lonely that the gregarious instinct will cease to work so strongly in crowding men into the great industrial centers. (191.)

1 *The unemployed in Chicago in 1893.*—Mr. HOURWICH says that at the time of the great industrial depression, 1893, he had the chair of statistics in the University of Chicago, and he undertook, with the assistance of his class of graduate students, to study the condition of unemployment. Two police censuses were taken, and data were gathered by several of the agencies. The Central Relief Association examined individually 20,000 cases of application for aid, with the practical purpose of determining the worthiness of the applicant in each case. These figures were tabulated by Mr. Hourwich and his students. They examined data on file in the office of the factory inspector. They also made personal investigations of some 800 cases. Mr. Hourwich also went with a party of the students to the camp of the Coxey army, and examined personally some 250 members of it.

CIV INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

It was discovered, contrary to popular opinion, that nearly all the applicants for relief were residents of Chicago. Only a very slight percentage had not lived in Chicago for a period of years.

The average time of unemployment was about 5 months. This shows, not that these persons were unemployed only 5 months, but that they were able to eke out an existence for 5 months before going to the charity organization. For about 3 months, on the average, they had not paid rent; the landlords had borne with them to this extent; but they had paid rent for 2 months on the average, and they had got food. Very little property was mortgaged or pledged or pawned. The grocer and the milkman and the baker and the butcher had furnished some of the support. Some families owed in this way \$20 or \$25, but not all could get credit, and the amount of credit was not sufficient to carry them over a period of 5 months. Mr. Hourwich believes that a considerable part of the living for 5 months and the 2 months' rent must have come from savings. This shows, he thinks, that there must be in the hands of the workmen a certain fund to provide for such emergencies, and that they can tide over a slack season which lasts less than 5 months.

The unemployment was pretty well divided between the skilled and the unskilled, but very few members of labor organizations were among the applicants. There may have been less unemployment among them, or they may have been better paid and able to stand unemployment longer, or they may have been aided by their organizations. (185-188.)

Mr. WYCKOFF says that it was very plain to him that a considerable element of the unemployed in Chicago during the winter of 1891 and 1892 were to be classed as tramps. The tramps come into the large industrial centers in the winter because they can live better there than in the country. Large numbers of them make considerable sums of money by begging. He has been told that men who become proficient in that line may average as much as \$1.50 and \$1.75 a day. The saloons which furnish free lunches make it possible for them to live on comparatively small sums, and they can sleep in the 5-cent, 10-cent, and 15-cent lodging houses. At the worst there is always the police station to fall back upon. Mr. Wyckoff came very little into contact with tramps in the course of his experiential experience as an unskilled laborer. He did the most of his traveling by walking along country roads, and very few tramps are to be found there. Tramps travel by the railway systems usually, beating their way on freight cars. (190.)

Mr. Wyckoff is certain also that many of the unemployed men whom he observed in Chicago in the winter of 1891 and 1892 were supported by the work of their children or that of their wives. (191.)

5. *Amount of unemployment in England.*—Professor COMMONS says that while the percentage of unemployment among the organized workmen in England fell as low as 1½ per cent in a period of great prosperity—December, 1889—the percentage among workmen as a whole never falls nearly so low. The unions include only about 15 or 16 per cent of the workmen of England, and even in the unions it was over 10 per cent in 1887. Booth's figures show as much as 30 per cent of unemployed in east London, and Professor Commons thinks that Mr. Booth would reckon 10 per cent of the workmen of the whole country as falling below the line of efficiency, either mentally, morally, or physically. (87.)

6. *Evils of unemployment.*—Professor COMMONS declares that if workmen can not be brought into the habit of thrift it is doubtful if we can make good citizens out of them; but if a man's savings are liable to be swept away by periods of unemployment over which he has no control the inducement to thrift disappears and character will be broken down. (84.)

7. *Unemployment and prices.*—Professor COMMONS shows by a chart, indicating the movement of prices and also the percentage of unemployment of organized workmen in Great Britain from 1887 to 1900, that during this period the changes of employment varied constantly with the changes of general prices. As prices went up unemployment diminished, and as prices went down unemployment increased. There was not more than one month during this period in which the rule was not verified. Professor Commons does not undertake to say which is cause and which is effect. (34, 35.)

8. *Indiscriminate giving.*—Professor COMMONS thinks that the reason why people give indiscriminately to beggars is that when a man is asked for alms and is told that the beggar can not find work he feels that the burden of proof is on him to show that the man can find work. In Holland the labor colony furnishes a place where work can be found by anybody. This shifts the burden of proof to the beggar to show why he should not be at work in the labor colony. Professor Commons believes that in Germany public begging has practically been abolished by the establishment of such institutions. (38.)

9. *Remedies for unemployment.*—(a) *Generally.*—Mr. WYCKOFF considers that the most impressive feature of the problem of the unemployed in this country is the

lack of scientific distribution of population, and that measures looking to a more scientific adjustment of the supply of labor to the demand would go to the root of the difficulty. (195.)

Mr. REYNOLDS finds that one reason why our people refuse to go from the city to the country is that they prefer to live in the city, and another reason is that they feel that if they get into the country they are lost. If they should become stranded there, their position would be much more calamitous than in the city. The great need is some well-arranged communication between city and country by which those who want work done could be brought into direct contact with those who want to work. (94.)

Mr. WILLOUGHBY thinks that the evidence is strong that trade unions look after their own members very adequately, and that the problem of unemployment relates almost exclusively to unskilled labor. He suggests that if cities could so organize their work which requires a large amount of manual labor, such as street sweeping and road making, that the service could be expanded when many were out of work. That would be the best way of meeting unemployment. When an attempt is made to organize a special relief scheme from the beginning after the necessity arises it is almost always a failure. (170, 171.)

Professor COMMONS believes that a large proportion of those who are unable, by reason of mental, moral, or physical weakness, to come up to the standard of efficiency required by the conditions of modern industry, and so go into the ranks of the unemployed, might be made self-supporting by subjecting them to a regime of steady and compulsory labor under proper supervision and training, and that by virtue of the training a certain proportion might be made capable of self-support in ordinary competitive industries. That particular weakness which shows itself in epilepsy is cured in the epileptic colony of New York, by giving the patients suitable outdoor work. The superintendent of the institution for the feeble-minded in Ohio believes that by taking all the feeble-minded of the State and employing them upon 1,000 acres of land he can make them self-supporting. The experiment is to be tried, but has not yet had time to show its results. A similar experiment is applied in the Australian colonies to drunkards. In Holland there is a free labor colony where those are employed who have not the ability to maintain themselves in competitive employment. Holland seems to have made a mistake in permitting people of this character to settle permanently with families in her labor colony, and to multiply and produce incompetents. In New South Wales it is proposed that the labor colony be a temporary place, and that when a man has shown his competency there, he be promoted, as it were, to a homestead on government land. It is proposed that he be provided with a cow and a horse, perhaps, and that a certain amount of capital be lent him by the government at 4 per cent interest, and that he be taxed merely on his land value and not on his improvements.

Professor Commons would wish to get rid altogether of the penal idea in connection with such institutions. A court committee would be necessary, but it should not be regarded as a penal procedure. A distinction should be made between compulsory work and penal work. Our present method of commitment to jails and so-called workhouses simply hatches criminals. (37-40.)

Professor Commons says that the idea of the shorter day as a remedy for unemployment is based on the theory of underconsumption; namely, that the producers of commodities have not enough earnings to buy all that they produce. It is held that in order to remedy unemployment we must give a greater consuming power to the masses of the people. The working people simply live from hand to mouth and consume what they get. The wealthy classes, with their large incomes, do not in fact consume all that comes to them. They therefore invest a large part of their incomes in productive enterprises. They add to the productive capacity more than the market will stand. In the end more goods are produced than there is a market for, and collapse necessarily comes. If the working people, who consume all they get, had a larger purchasing power, the consuming power of society as a whole would be greater, and its producing power would be less; so the phenomenon of congestion would not appear.

Professor Commons does not think that shortening of the hours of labor is a remedy. If a man can produce as much in 8 hours as in 10, as is said to be the case in some industries, it is evident that the 8-hour day will not increase the demand for workers. If the production of each individual is diminished with the shortening of hours, and wages are diminished in the same proportion, there will be a demand for more workers, but the aggregate wage payments to the greater number will be no more than was formerly paid to the less, and the consuming power of the wage workers will not be increased. Finally, if individual production is diminished and daily wages are not diminished the cost of production will be increased, "and an increased cost of production means that the

CVI INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

purchasers will purchase a smaller quantity of the product—there will be less sales, and consequently the unemployment would not be remedied in that way."

The most thorough experiment that has been made with the 8-hour basis has been made in Australia. It has not abolished unemployment there. There is as much in Australia as here. (36.)

Professor Commons says that under any system of public work in this country, workmen are certain to get the idea that they can appeal over the heads of the foremen to somebody. They will appeal to the alderman or the political boss. This is the strength of the ordinary political machine. Colonel Waring invented a means of abolishing this trouble in the street-sweeping department of New York. He organized a board of representatives of the street sweepers, elected by the men and including no representative of the commissioner himself. When a complaint was made against a foreman it was considered by this board. Two-thirds of the complaints were dismissed by these representatives of the men without going any further. When this board thought a complaint well-founded, the matter was carried up to a board composed of 5 members elected by the representative board and 5 members appointed by Colonel Waring from the superintendent's staff. These 10 men considered the appeal. They settled every case that was brought before them except one. Just one appeal was taken to Colonel Waring himself, and he decided that in favor of the man. (42.)

Professor Commons thinks that if relief for unemployment is to be found through public work, the work must not be done through contractors. When a million dollars was recently distributed in Porto Rico for this purpose, the work was done through contractors. The contractors cut the wages, and compelled the men to buy from company stores, and the expected benefit did not appear. In Great Britain it was found that army clothing was being made by contractors in sweat shops, at very low pay. The Government introduced a clause requiring that in all public contracts the prevailing rate of wages be paid. In London the difficulty of enforcing this clause has led to the doing of municipal work largely by the municipality directly. A special advantage of this method is that it is possible to increase the activity of work in the winter when private employment is slack. The Boston water-works department has adopted this policy. It bought steam machines for thawing out the ground so that water pipes could be laid in the winter. It reported 3 years ago that, taking into consideration the way in which the whole staff could be readjusted and organized, it was found that this method did not involve any additional cost. (41-42.)

Professor Commons thinks that the great difficulty in our State charities and penal institutions has been the contest between the two political parties to get possession of the offices. This trouble has been met by the institution of a non-partisan board, unsalaried, having an equal number of members from each party, and having no offices to distribute. Such boards are peculiar to this country, and are the outgrowth of our governmental conditions. The first was established in New York in 1862. It has been found possible to get on these boards men who have a genuine interest in the reform of the prisons and the charities. Practically all the progress that has been made in this country in improving our State charities and prisons has been due to these boards. The board meets perhaps once a month, and remains in session for 2 or 3 days. It appoints a secretary, who is a salaried official, and who is or becomes an expert on the questions with which the board has to deal. When questions of legislation regarding State prisons or charities come up the members of the board and its secretary are called upon, as a matter of course, for expert advice. (32, 33.)

(b) *Public work.*—Mr. Woods considers that for the unemployed who are not in any way delinquent some sort of public work should be provided which should carry no stigma with it. The opportunity to earn an honest living ought to be given to every man without placing upon him the disgrace of being a pauper. (201.)

Bishop POTTER thinks that it may possibly be worth while in certain emergencies to give people State assistance in finding work, as in transporting them long distances; but, "on the whole, when the State goes into that business it interferes in a way with the freedom of action of individuals." He is not sanguine as to the desirability of State legislation dealing with unemployment. (11.)

(c) *Labor gazettes.*—Professor Commons suggests that labor gazettes or monthly publications, describing briefly the state of employment in the different localities and the rates paid, are important helps against unemployment. The best gazette of this kind in the world is published in New Zealand. There are such publications, however, in France, in Belgium, and in England. There are none in this country. The labor unions do something in disseminating such information for the benefit of their members. (41.)

(d) *Proposed method of dealing with tramps.*—Mr. Woods, of the South End

House, Boston, thinks that if every town of more than 5,000 people were compelled by State regulation to provide a suitable work test for tramps, their roving would be put an end to. This system has been tried in a large number of towns in Massachusetts with great success; these towns are avoided by the tramps. (200.)

(e) *Labor colonies.*—Mr. WILLOUGHBY says that the labor colonies of Germany were started under private auspices, though he believes that they now receive contributions from the local authorities, and possibly from the State. They reach only the permanently incapable. A large proportion of the inmates have been convicted of crime. Over half have been in the colonies before, and many have been there repeatedly. The main function of the colony seems to be to segregate the hopelessly inefficient persons who would have to be taken care of, perhaps in jails or poorhouses, if they were not taken care of there. Very few are permanently reformed to such an extent that they can be restored to society and become independent workers again.

The Dutch colonies are quite different from the German. They are more select and appeal more to the family man than to the single man. The purpose of them is permanent reformation. Their system is very expensive, and even if it is successful it counts for very little, because the funds allow them to help only a few families each year.

The Australian States have had considerable success in organizing labor colonies, but that is because they have had large tracts of waste land which have required a large amount of ordinary manual labor. In the older communities, it is hard to make use of great amounts of such labor. (177.)

E. Effect of machinery on labor.—1. *Effect on employment.*—Mr. JOHN GRAHAM BROOKS, president of the National Consumers' League, believes that machinery sets more people to work than it throws out. Yet if it is introduced under conditions which the labor organizations have no voice in determining, the laborers feel helpless to secure their share of advantage and their organizations are weakened or destroyed. This has been the effect of the lasting machine and other important machines in the shoe industry in New England. (140, 141.)

2. *Effect on wages.*—Mr. McDERMOTT, editor of the *Boot and Shoe Recorder*, says that the development of labor-saving appliances has tended to increase wages. In the United States, where there is the greatest development of machinery, the highest rate of wages is paid, and wherever there is development of machinery and labor-saving appliances there is a corresponding development in wages. The introduction of machinery, therefore, has been an advantage to labor, and the laboring men are now themselves beginning to recognize this fact. (502, 505.)

Mr. Fox, president of the Iron Molders' Union, says that until within the last 10 years, or possibly 5 years, labor-saving machinery was not a serious factor in the foundry, but recently the molding machine has undergone a wonderful development. Molding machines are of various kinds; some for packing the sand in the mold and some for drawing patterns. In all cases they are improved appliances rather than machines. The removal of the pattern from the sand is a part of the process of molding which requires the highest skill, especially in the case of the smaller castings, as the surface of the mold may be disturbed by the slightest swerving. The stripping-plate machines greatly simplify this operation and supplant the skill of the molder. All the machines greatly increase the quickness of the operation. The application of the machines is confined to the smaller castings of which many duplicates are to be made. Mr. Fox is not prepared to say that the machine has actually displaced any men, in the sense of reducing the number of molders. Increased demand seems to have prevented that. The real trouble is the wage question. Foundrymen seem to prefer to teach unskilled laborers to operate machines instead of employing molders. Unskilled labor, being accustomed to work for less than the mechanic, will operate the machines for less. The union does not oppose the machines; it only asks that its members be employed on them and that wages be maintained. It advises its members to promote the development of the machine, and to bring out its best possibilities when they have a chance to operate it. Employers have feared that the union would try to restrict the output of machine molders, but this is not the union's policy. (148-150.)

F. Rates of wages.—1. *Wages of unskilled labor.*—Mr. WYCKOFF testifies that the first job which he obtained in his experiment of earning his living as an unskilled laborer was on the tearing down of the old academy building at West Point. Here he received \$1.60 a day. His next employment was that of a hotel porter in the Highlands in eastern New York, where he received \$8 a month and his board and lodging, for work which often extended to 16 hours a day. Soon after he got work in a logging camp in Pennsylvania at 75 cents a day and his keep. In Chicago, as a hand truckman in a factory, he received \$1.50 a day. On farms

OVIII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

west of Chicago he was offered quite uniformly \$20 a month and everything found, even including washing, as a regular rate from the 1st of April until the end of November, with the alternative in the haying season of a daily wage of \$1 and everything found. If he had had any skill at the work he could easily have got \$2.50 a day during the harvest season. Many men were getting \$3. The harvest lasts only a few weeks, however. At Council Bluffs Mr. Wyckoff got a job in a livery stable at \$20 a month and his board. He had the option of receiving \$30 and finding his own board. About 200 miles west of Omaha he got work with a gang of navvies on the Union Pacific Railway at \$1.25 a day. At Creede, Colo., he got the highest pay he ever received as an unskilled laborer, \$3.50 a day. This was on road making. (188, 184, 187-189.)

2. *Average wages in Missouri.*—Mr. RIXEY, commissioner of labor statistics, Missouri, presents a table from his annual report, giving the average daily wages of skilled and unskilled labor, as determined in 40 occupations in Missouri. The average of all, as given in the table, is, for males skilled, \$2.35 a day; unskilled, \$1.28; for females, skilled, \$1.32; unskilled, 78 cents. Mr. Rixey believes that the average number of days of employment to which the average rates of wages refer is nearly the full number of working days in the year. He says that wages have shown in recent years a slightly upward tendency. The change is not great, however, while the prices of the necessities of life have noticeably risen. (73, 74, 77.)

3. *Economy of high wages.*—Mr. STEEL, a woolen manufacturer, thinks that the purchasing power of the people in this country, due to higher wages, is one of the great causes of the prosperity of the country. The consuming power of the common people in Europe is very limited. (239.)

4. *Wages and productivity.*—Mr. JUSTICE, a wool merchant of Philadelphia, is informed by Edward T. Steel & Co., who formerly had a mill in Bradford, England, and moved it to Bristol, Pa., that they pay \$10 a week to some of the same work people to whom in England they used to pay £1. The machinery was run as fast as it could be run in both places, and there has been practically no difference in the output. The only difference is that discipline can not be as well maintained in America. A spirit of independence arises which does not exist in England. On the whole, no better results are obtained from the same labor, with better food, better housing, and better wages. (780.)

5. *Evils of low wages.*—Mr. WOODS, head of the South End House, Boston, says that while he has found that the instances in which women have been driven into sin by want are comparatively rare, yet where large numbers of women receive \$5 or less per week and have to pay \$4 for board and lodging, it is easy to see how strong the temptation to prostitution is. While prostitution is often due to other causes, it is also true that it exists because it is impossible to hold human beings to the hard limits of a bare subsistence. (200.)

6. *Wage system of J. H. Williams & Co.*—Mr. WILLIAM C. REDFIELD, treasurer of J. H. Williams & Co., manufacturers of drop forgings, says that that company, as a rule, advances wages voluntarily. There has never been a general demand for an increase of wages by the employees, and none of the workmen have ever had their wages reduced. The foreman is always on the lookout to raise wages whenever one of the workmen by superior efficiency and economy earns an advance. The rates paid for piecework have never been reduced by the company. It is believed that when by the piecework system a man through skill and energy increases his earnings, he should receive the increase, because the employer economizes on fuel, interest, and other important items. In an industry such as that of manufacturing forgings repairs are a large item, and a well-paid man so cares for his machine as to minimize the need for repairs, because he loses by the time taken for such repairs. Men on piecework who are well paid willingly replace in their own time work which has been spoiled through their fault, and pay at cost for the material and fuel used. If the company puts in improved machinery, it makes no change in the piecework rate, but the workman gets the advantage of the increased output made possible by means of the new machinery.

When men are paid wages according to the time system they do not get any direct advantage through the putting in of improved machinery; yet, as a broad fact, it is true that as machinery and product improve, wages rise and the cost of production decreases. (659, 662, 663, 666.)

G. *Methods of paying wages.*—1. *Time of payment.*—Mr. HARRAH, president of the Midvale Steel Company, says that he has found it best to pay his men every week and to pay in cash. If payment is made in checks the storekeeper who discounts the checks is certain to make something out of it, and if payment is made once in two weeks or once a month hardships may be caused to some of the men. (851.)

Mr. IRA DIMOCK, president of the Nonotuck Silk Company, says that that company has paid wages weekly since 1886. The weekly payment of wages is required by the Massachusetts law. The system is a benefit to employees, as it enables them to pay cash for what they get, and they are not compelled to run up bills. (894.)

Mr. JAMES WHITEHEAD, representative of the Weavers' Progressive Association, of Fall River, says that the weekly payment law in Massachusetts gives perfect satisfaction. The weekly payment of wages gives operatives an opportunity to purchase where they feel disposed. The system has done away with a good deal of the giving of credit. (575.)

Mr. THOMAS O'DONNELL, secretary of the Fall River Mule Spinners' Association, says the weekly payment of wages is a great benefit to the wage-earners, as it enables them to buy most advantageously. (568.)

2. *Company stores.*—Mr. HARRAH says that his company has no stores and no dwellings for the men. He does not think it good policy to go into such enterprises. There is a tendency to force men to deal at the company store and to live in the company tenement. This is not fair to the men; and if a man is compelled to do what he does not want to do, even if it is for his benefit, it makes him dissatisfied and leads to trouble. (351.)

Mr. WHITEHEAD says that he does not know of any company stores in Fall River. In some of the mills, operatives can go to the mill office and get a note, make purchases at certain stores, have the purchases charged and the amount taken out of their wages. There is nothing compulsory about this, however. (576.)

II. Hours of labor.—1. *Duration dependent on occupation.*—Bishop POTTER does not consider that any hard and fast general rule for the hours of labor of all workers can be fixed. The character of the work must be taken into account. In the case of railroad engineers, he finds that the men themselves have a very definite conception of the length of time during which a man can stand in front of a throttle valve and run an express train. Where work is of an artistic quality, he believes that the mental power becomes so far weakened after a certain time that the excellence of the work suffers, and that on this account the employer will gain by exacting only moderate hours of labor. When he acted as arbitrator in the strike of lithographers in 1896, it was largely on this ground that he fixed the 7 hours at 47½ a week. The argument that if some establishments in a trade are compelled to shorten their hours their competitors will have an unfair advantage, is not conclusive. "You must make a beginning somewhere. It must impinge upon somebody, and the hope is that you can pull up the whole line to a higher standard." (10, 11.)

2. *Eight-hour day.*—Mr. STEINBISS, general secretary-treasurer of the National Building Trades Council, gives the result of some inquiries as to the extent to which men in the building trades work over 8 hours a day. The details which he gives, relating to the cities in which local building trades councils exist and are affiliated with the National Building Trades Council, indicate that the great majority of the workers belonging to these councils do not work more than 8 hours. In some cases hours are longer for shop work than for outside work in the same trade. Mr. Steinbiss suggests that this is because workmen outside the building trades are employed in the same shops and are less advanced than the building trades workmen, while the 8-hour law can not well be enforced for some without being enforced for all. So far as physical conditions are concerned, shop work is quite as trying as outside work, and perhaps more so in some trades. The building trades have succeeded better than most others in cutting down the hours of labor, and the reason is that in the building trades only a few men are employed by each contractor, while the factories are controlled by companies, which are harder to influence. The example of the building trades is having an effect, however, on other workers. (17.)

Mr. Steinbiss says that the shortening of hours in the building trades necessarily makes the erection of buildings somewhat more expensive, but he does not think that it diminishes construction. As the hours of workmen decrease and their wages increase, they themselves have more to spend in building. (17.)

Mr. SINGER, president of the Central Convention of Shoe Workers of Philadelphia, says that this organization has not made any efforts to secure the 8-hour day. He believes, however, with many others that it would be far better for all if the 8-hour day were obtained. He has heard such expressions from many of his fellow-workmen and more from pieceworkers (who are in the majority among his fellows) than from day workers. The earnings of the pieceworkers would be reduced, but he has heard them say that they would be satisfied to have shorter hours and let those have work who are unemployed. (382.)

OX INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

3. *Effect of shorter workday on production.*—Mr. REDFIELD says that on January 2 last, J. H. Williams & Co., after consultation with the leading workmen, reduced the hours of labor from 10 hours a day to 9 hours a day, and at the same time paid for the 9 hours the wages previously paid for 10 hours. The experience of the company thus far has shown that the 9-hour day is profitable, for there has been a slightly larger average output for the 9-hour day than there was for the 10-hour day, though in every other respect work has been done under similar conditions. In the grinding department, where the severest test would come, the output under the 9-hour day has come within 1 per cent of the output under the 10-hour day. This has not been due, either, to the fact that methods were lax previously, for there was rigid supervision under the 10-hour system. A part of the gain has undoubtedly been made by reason of the fact that under the 9-hour system the men go promptly to work on the minute and work close up to the close of the day. It is true, however, that a man can work normally at a higher rate of speed without pushing himself for 9 hours than he can for 10 hours. The fundamental reason for the keeping up of the amount of production is to be found in the spirit of the men themselves. It is, of course, true that if a machine were speeded up to the highest point, were kept in absolute condition, and were continuously fed, a workman could not keep his output up to the same amount if the hours of labor were shortened, but these perfect conditions are rarely, if ever, found. It can not be demonstrated mathematically just how it happens that a man produces as much in 9 hours as he formerly produced in 10 hours, but, as a matter of fact, it has been the experience of almost every manufacturer that a man can and will and does do more the moment he is justly and fairly and liberally treated. The business done by J. H. Williams & Co. involves the use of a great many different kinds of machines, and the experience of the company has been such that it is entirely satisfied with the situation which has developed from the shortening of hours and considers that no loss has resulted. This feeling is shared by at least one other large establishment in the city of Brooklyn, an establishment employed in the building of hoisting engines. (659, 663, 664, 665, 666.)

Mr. FRANK W. CHENEY, treasurer of Cheney Brothers, silk manufacturers, says that it might be possible in some departments to turn out as much work in a 9-hour day as in a 10-hour day. That would not be true, however, in departments where machinery comes in as a heavy element. A machine runs straight ahead, and the more minutes it runs in a day the more work it turns off. In industries where work is paid for by the piecework system, as is the case in the manufacture of drop forgings, the workmen would be anxious to get out as much as possible. Where workmen were paid by the day, however, they would have no particular incentive to hurry. (733.)

Mr. STEINBISS does not believe that a man can accomplish as much in 8 hours as in 10. "If that were the case our object would fail. The object in introducing the 8-hour workday, and lately the Saturday half holiday, is to give the unemployed work." A further object is to insure sufficient rest and recreation to workers. (16.)

Mr. WHITEHEAD says that the shortening of the hours of labor would not necessarily mean that there would be smaller production. It has been demonstrated beyond question that a man working 8 hours a day will accomplish as much in the year as he would working 10 hours a day. (577.)

4. *Hours of labor for women.*—Mr. LINCOLN GODFREY, president of the Eddystone Manufacturing Company, says that under the laws of Pennsylvania women and minors are treated alike as to the hours of labor, and the law provides that they can not work more than 12 hours in any one day or 60 hours in any one week. Many of the women would like to work overtime, and there is not any reason why a grown woman should not be permitted to use her own judgment as to the number of hours she wants to work, the same as a grown man. The women could correct abuses just the same as the men can. (481.)

Mr. WHITEHEAD says that he believes that the hours of labor are too long for both women and minors. If possible, there ought to be a national law enacted shortening the hours of labor for women and children. It would not necessarily follow that if the hours of labor of women and children were reduced the hours of labor would be reduced for men too. (577, 578.)

5. *Hours of labor in Europe.*—Mr. JUSTICE, a wool merchant of Philadelphia, speaks, from information received, of 12 and 14 hours of work a day in hosiery mills in Chemnitz, with work on Sunday up to 12 o'clock. In this country we work 10 hours a day, and never on Sunday. "In Germany they work longer hours than they do in England." Mr. Justice does not mention the English hours specifically. (884.)

III. SPECIAL LABOR PROBLEMS. LABOR LEGISLATION AND OTHER REMEDIES.

A. Labor legislation in general.—1. *Desirability of uniform laws.*—Mr. WOODS, head of the South End House, Boston, says that there is a good deal of feeling in Massachusetts that some national factory legislation is needed. Difficulty is found in bringing the Massachusetts legislation to the level which should be reached in an enlightened modern community, because certain other States are very slow about making beginnings in that direction. (201.)

Mr. ROBERT T. DAVIS, President of the Stafford, Wampanoag & Algonquin Print Mills, is in favor of a national labor law limiting the hours of labor in the different industries, and equalizing labor conditions in the different States. (591.)

Mr. SIMON B. CHASE, treasurer of the King Philip Cotton Mills, thinks that it would be very desirable if there could be national legislation in respect to hours of labor, sanitation, factory inspection, etc., so that there should be a uniform condition of things for manufacturers in different parts of the country. (563.)

Mr. PIERCE, president of the New England Cotton Yarn Company, says that it would be an advantage if there could be a national labor law, so that competition would be more nearly uniform. (545.)

Mr. CHARLES H. McDERMOTT, editor of the Boot and Shoe Recorder, says that the shoe manufacturers of Massachusetts would like very much to see the substance of the laws of Massachusetts concerning child labor, inspection, hours, and female labor enacted in other States where they have competitors. (504.)

Mr. THOMAS O'DONNELL, secretary of the Fall River Mule Spinners' Association, thinks that there should be a national labor law. The workmen in Massachusetts are handicapped in their efforts to get more favorable legislation in regard to hours of labor and other matters on account of the laws relating to such matters in other States. (569, 570.)

Mr. JAMES WHITEHEAD, representative of the Weavers' Progressive Association of Fall River, says that the hours of labor ought to be the same throughout the country, and that he would like to see a national working day of 9 hours. The mill operatives in the Southern States are at the present time much interested in bringing the hours of labor down nearer to what they are in other States. (578.)

Mr. JAMES TANSEY, secretary of the Carders' Association of Fall River, says that uniformity in industrial legislation throughout the country is very desirable. The hours of labor ought to be uniform and shorter. Shorter hours of labor would mean lesser production, and would have a tendency to advance prices and wages. (580.)

Mr. JOSEPH G. JACKSON, secretary of the Slasher Tenders' Union of Fall River, believes there should be national legislation in respect to labor, and that there should be both national and State inspectors appointed. (585, 589.)

2. *Prohibition of night work.*—Mr. T. O'DONNELL, says that recently some of the mills in Fall River began to run nights with a second set of help. The Mule Spinners' Association is opposed to night work on principle, and has been trying for several years to get legislation preventing night work on the part of women and minors. (570.)

3. *Wage law in New York.*—Mr. WILLIAM J. O'BRIEN, of the Granite Cutters' National Union, says that there is a law in the State of New York providing that State and municipal corporations, and contractors or subcontractors employed by them, shall pay to their workmen the prevailing rate of wages paid in the locality where the work is performed. This law prevents a man from importing cheap labor, and has proved to be very effective. There has been trouble in Chicago over the wages paid to workmen employed in constructing the Chicago post-office. If there had been a law similar to the one in force in New York, the contractor would have been compelled to make proper terms. The matter has now been settled, but there was not much progress made on the building until the settlement was reached. (434, 439.)

Mr. LEO, president of the Builders' League of New York, speaks of the prevailing rate of wages law, passed in New York in 1898, as "the worst sample of law, passed largely by the labor lobby." It enables men employed by municipalities to claim extra pay for any extra time they may have worked in the past, during the full term of their employment. He believes that suits have been entered under it for over \$3,000,000, and that the corporation counsel of New York City has confessed judgment for large amounts. (101, 103.)

4. *Influences securing labor legislation.*—Mr. LEO, asserts, as of his own knowledge, that the Central Federation of Labor of New York City has maintained a lobby of 8 or 10 men at Albany through the whole session of the legislature, either at its expense or at the expense of the several affiliated organizations. The policy

CXII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

of the unions has been to make a blacklist of men who are alleged to have opposed their measures. They put on this list every man who refuses to accept their propositions in full, without modification. The Federation has in some cases admitted that it has been unfair in denouncing men for offering certain amendments, though they were in sympathy with the desires of the unions. (102, 103.)

Mr. LAWSON, vice-president of the Builders' League, of New York, complains of the injurious activity of the labor organizations in promoting legislation. The Builders' League has had to send representatives to Albany every winter for years to try to beat bad bills and get good ones passed. He would be glad, and he is sure his organization would be glad, to confer with the labor organizations in advance with regard to proposed legislation. The labor legislation which is introduced is often ridiculously unfair, and the promoters of it can sometimes be led to see the wrong of it when the case is fairly presented to them. Yet he does not think the agreement for preliminary conference could be brought about. If the employers proposed it, the workmen would think they were seeking an advantage. (104-106.)

Mr. HARDING, a building contractor, says that when he has had occasion to speak with members of the legislature about pending bills, he has always found a great fear of the labor element. The labor organizations print a black list of public men who have acted contrary to their wishes, and circulate it among their members. The fear of getting on this list exercises a powerful influence on legislators. (107, 108.)

Mr. Harding says that the Builders' League has a committee to watch proposed legislation at Albany, and there is also a legislative committee supported by the Building Trades' Club, the Masons and Builders' Association, the Master Carpenters' Association, the Master Plumbers, and the Master Steam-Fitters. The two committees often cooperate. They do not have representatives constantly at Albany, but they have copies of all bills sent to them, and send committees to Albany when it seems necessary to act with regard to any measure that has been introduced. (107.)

B. Bureau of statistics of labor.—Mr. RIXEY, commissioner of labor statistics of Missouri, says that the duties of his office include the gathering and furnishing of information with regard to all the mechanical, agricultural, mineral, educational, labor, and other interests of the State. He also has the supervision of the inspection of sweatshops and manufactories; and the two State free employment bureaus are in his charge. He is permitted to expend \$24,000 a year in addition to his own salary of \$2,000. He employs 6 or 8 people in all. (61, 75.)

C. Labor councils.—Professor COMMONS thinks that labor councils, somewhat after the pattern of our State boards of charities and corrections, might well be established in the different States and also under the General Government. Such boards exist in several European countries. The object of them is not the equal representation of two political parties, as in our State boards of charities, but the equal representation of capitalists and laborers. The French board, called the Superior Council of Labor, is composed of 16 members, elected by associations of capitalists, manufacturers, etc.; 16 representatives of the labor organizations, and 16 experts appointed by the Government. The council has existed since about 1891. Until 1899 all members were appointed by the minister of the interior. Belgium has a somewhat similar council, instituted about the same time as that of France. Austria has one which was established several years later.

Professor Commons remarks that our Department of Labor is often criticised because it does not undertake to draw conclusions from the voluminous materials which it collects. In his opinion this is beyond its province. The Commissioner of Labor is an administrative officer. A council like that of France, however, could take the material furnished by the Department of Labor and draw conclusions, and recommend legislation upon the basis of it. In France, when the question of the prevailing rate of wages on public contracts was brought before parliament, parliament referred it to the labor council. The labor council called on the department of labor for information as to the practices in other countries, and the resulting report is the most complete in existence up to the date of it—1897. The council recommended that in all public contracts a clause be inserted requiring that the prevailing rate of wages be paid, and about a year afterwards parliament adopted the recommendation. (83.)

Mr. WILLOUGHBY says that there has developed in Europe quite an elaborate system of labor councils, whose functions are different from those of arbitration boards. Their purpose is rather to furnish the employees with an organ for learning what public opinion is, and for exercising an influence upon public opinion. They are composed partly of employers and partly of employees. The government takes the opinion of these councils in regard to social matters, and the councils dis-

cuss them and report. The wage workers on the continent are not organized like those of Great Britain or of the United States, and the press does not give any such opportunity for developing or expressing public opinion. There is a field for such councils in those countries, therefore, which does not exist here. (176.)

D. Factory inspection. Existing conditions.—1. *Factory inspection in Massachusetts.*—Mr. IRA DIMOCK, president of the Nonotuck Silk Company, says that in Massachusetts there are State inspectors who visit factories from time to time to see that the laws in respect to the hours of labor are observed. The inspectors also note whether there is any dangerous machinery in use, whether the machinery is properly guarded, whether fire escapes are provided, etc. The restrictive laws as to hours of labor, etc., do not in any way interfere with the business of his company. On the whole, it is better that there should be such laws, though some of the requirements come pretty close to being an invasion of private rights. (695, 696.)

Mr. JAMES TANSEY, Secretary of the Carders Association of Fall River, says, that the factory laws in Massachusetts are quite well executed. There are some defects, however, in the laws themselves. (580.)

Mr. JOSEPH JACKSON, Secretary of the Slasher Tenders' Union of Fall River, says that the factory law in Massachusetts is defective in that, in order to prove a violation of the 58 hour law, it is necessary to have the employee testify. The inspector's evidence ought to be sufficient to secure conviction. (589.)

2. *Factory inspection in Missouri.*—Mr. RIXEY says that his State has no State factory inspectors. In 1892 the legislature passed a bill making it the duty of the city authorities of all cities of 5,000 population and over to appoint factory inspectors and provide for their compensation. St. Louis has, however, never complied with the law. In Kansas City the building inspector is also factory inspector. The State commissioner of labor statistics is the head of the factory inspection system, and the city inspectors are expected to report to him. The inspection is meant to cover sanitary conditions, and by a recent law it has been extended to bake shops. (61, 73.)

3. *Maintenance of sanitary conditions.*—Mr. REDFIELD says that bathrooms have been placed in each department of the shops of J. H. Williams & Co. Each bathroom contains lockers for the men in the department, has the best sanitary plumbing arrangements and a shower bath. For the purpose of exhausting emery dust from the grinding room, a hood is fitted over each wheel and connected with a tube passing through the floor into a large main, through which it runs to a powerful fan situated high up under the forge roof. This draws the dust inward and downward from the grinding wheels into a large receiver whose outlet projects beyond the forge roof. The floors of the forge shops are covered with iron plates so as to promote cleanliness. The shops are ventilated by means of placing individual chimneys for the hoods over each fire to remove gas and hot air, and by furnishing ample window space and a double line of overhead fan lights at the top of the building. In addition, clean fresh air is drawn in by powerful fans and distributed through the shops in such a way that it descends above every man's head through a flexible pipe which is under his control. In the summer months an abundant supply of cool and carefully filtered water is provided for the workers. The equipment of the works in regard to safety appliances is far beyond the requirement of the law, and employees are requested to point out to their respective foremen any defective or dangerous conditions existing in any machine or apparatus. Cuspidors are provided, and spitting on the floors or stairways is forbidden. Waste cans for both clean and oily waste are furnished, both for cleanliness and to avoid danger from fire. The machine shop floors are scrubbed weekly with hot water and soda. The works have been made attractive to the eye by the training of vines over the exterior of the buildings and by planting the yard with quick-growing vines and flowering plants.

The company has offered prizes open to all employees not on salary for suggestions for improved methods of management, and a number of valuable suggestions have been received and adopted. (657, 658, 659.)

4. *Precautions against fire.*—Mr. REDFIELD says that J. H. Williams & Co. has organized a fire brigade among its employees which, on trial, has proved most efficient. Thousands of dollars have been spent also on fire protective, restrictive, and extinguishing apparatus. The company has a water supply which is independent of the city water supply, the water being secured from wells in the factory yard. (658.)

Mr. FRANK W. CHENEY, treasurer of Cheney Brothers, says that mills are subject to rigid inspection by insurance companies. The mutual companies will not now insure the old fire traps that used to exist, and they require the concerns which they insure to take very elaborate precautions against fire. (735.)

5. *Bake shops. Inspection and conditions.*—Mrs. SYMONDS, labor editor of the Philadelphia Enquirer, says that when the Pennsylvania bake-shop-inspection law went into operation, she went around with the deputy inspectors on their visits to the bake shops. The conditions in bake shops run by immigrants of the same low class as those who carry on the sweated clothing industry were most repulsive. The floors and even the boards on which the dough was worked up were filthy. The toilet rooms opened directly from the places where the bread was baked and were indecibly vile. The factory inspectors gave orders for the cleaning of these places, and when the time for compliance had expired, Mrs. Symonds went the rounds of the shops again. The change was marvelous. But the biggest bakers in the city, men who ought to have followed the letter and the spirit of the law, fought it in the courts and succeeded in getting it declared unconstitutional. The factory inspectors still continue to make the rounds of the low-class shops, and Mrs. Symonds believes that, because the proprietors of them have not learned of the destruction of the law, the inspectors are still able to keep them up to a tolerable degree of cleanliness. (262, 263.)

E. *Child labor.*—Mr. DIMOCK says that the Massachusetts laws allow children above the age of 14 to work in mills, provided they furnish a certificate from the school superintendent that they attend night schools. This restriction applies until the children become 16 years of age. Mr. Dimock submits a copy of the Massachusetts law relating to the employment of children. (694, 698, 699.)

Mr. FRANKLIN ALLEN, secretary of the Silk Association of America, says that in New Jersey and in New York the laws regulating the employment of children are more strict than are the laws in Pennsylvania. This explains why so many more children are employed in the silk mills of Pennsylvania than in New Jersey or in New York. (Children are employed more largely in the throwing branch of the industry than in weaving, and are employed in large numbers in the sewing-silk branch. The States having the largest proportion of such output, therefore, will show a larger percentage of children employed. (680.)

Mrs. SYMONDS refers to the misstatements of the age of children which parents make in order to get permission under the factory laws for them to work in factories. She has seen the same thing among the breaker boys in the coal regions. It has been suggested that the parents be required to produce before the magistrate a record from the church in which the child was baptized, if a Christian, or the record of the child's admission to the primary school, which would give the age of the child at that time. Mrs. Symonds adds that the provision of the Pennsylvania law that a child must know how to read and write before he can be employed is often nullified by the laxness of the magistrate, who simply assumes that the child has learned. She suggests that the magistrate should make an actual test. (263.)

F. *Employers' liability. Workingmen's insurance.*—1. *Employers' liability for injuries to workmen.*—Mr. HOURWICH says that there has been a two-fold movement in this country in modification of the law of employers' liability. The courts, by construction, have carried the law further away from the sound principles of the common law; on the other hand, the legislatures of the several States which have taken up the question have tried to define the law so that all the advantages of the common law should be secured, and have also tried to add some new safeguards necessitated by the growth of industry.

One of the chief provisions of the common law was the requirement that the employer furnish proper tools. Under modern conditions the tool has become something very different from the tool of primitive industry. There may be defects which are not known to the ordinary journeyman, and which he may even see without fully understanding the danger; yet the prevailing theory of the law of New York is that if any defect of the machinery is known to the employee, he assumes the risk. If the workman who handles a machine gives notice to the employer or the superintendent that the machine requires repairs, the courts have held that he has thereby displayed knowledge of the defects, and as he has continued to operate the machine, he has assumed the risk of the employment. The practical inference is that as soon as a machine is out of repair, the workman must go to the employer and say, "You must repair that machine or I will leave your employment." In the ordinary course of industry this can not be expected. If a workman gives notice of any defect, no more ought to be required of him. The employer should be required to make the repairs or bear the results of his carelessness.

Another thing of great importance is the fellow-workman clause. The courts of New York have even held that a foreman and a general superintendent are fellow-workmen. In the case of a corporation every act of an employer is necessarily the act of an agent. Every agent is, strictly speaking, an employee, a

workman, of the corporation, and consequently a fellow-workman of the employee at the machine. Strictly speaking, the theory of the courts exempts a corporation from any liability for any injury to its employees.

"There is no employers' liability under any circumstances under the present laws of the State of New York, as construed by the courts; and I think that there is certainly a need of some law which should protect the employee to-day just as the common law protected him two or three hundred years ago. We have outgrown the conditions of the common law in the first place, but, in the second place, whatever beneficial features there were in the common law have been done away with by the interpretation of the courts."

A certain number of lives and limbs are inevitably lost under the operation of our modern industry. The danger is not of such a nature that it should be thrown on the shoulders of the individual. It is the industry of the country at large that consumes these lives and limbs, and the country at large should be made responsible for it. The ground might be covered by a national insurance law or by some similar provision.

It is the duty, however, of those who manage the industries of the country to obviate as far as possible the dangers incident to production. It is the duty of the employer to see that the machinery is in good repair. If there are two processes, one of which protects the life of the employee better than the other, it is the duty of the employer to adopt it, and not to follow a dangerous or injurious process because it is cheaper.

The law of Illinois has a provision which is preferable to a doctrine of contributory negligence. It is the theory of comparative negligence. When an accident occurs, if there was negligence on the part of the employee, and still greater negligence on the part of the employer, the defense of contributory negligence will not avail. This is no very radical departure from our actual law. It is in accordance with the principles that the courts follow when property is at stake. If a shipper sues a common carrier for loss of freight, the common carrier must prove that it was perfectly guiltless of any contributory negligence. The burden of proof is on the company. If there was any negligence on the part of the company, no matter how negligent the shipper may have been, the common carrier is liable. But if any employee sues the common carrier for damages for personal injury, the employee must prove that he was perfectly guiltless of contributory negligence. This is somewhat contradictory. (151, 165.)

Mr. BROOKS declares that there is no adequate way of dealing with the victims of modern industry which does not definitely throw the expense of accidents upon the industry itself, precisely as with insurance against fire. He has never seen a student who has thoroughly studied the subject who does not consider that the principle of the British legislation on the subject ought to be fully adopted. There are some large corporations, like Mr. Carnegie's, whose employees receive, in case of injury, the full measure of what should be done for them. Mr. Brooks believes that the largest corporations in general do better than smaller employers. But this is benevolence. It should be put on the basis of right. (138, 139.)

Mr. WILLOUGHBY says that the provisions of the common law fixing the liability of employers for injury to employees came into being when employees were in intimate relations with employers and when it was easy to determine responsibility for accident. It is largely unjust under modern conditions. Saying nothing about the greater ability of the employer to bear the financial burdens of accidents, there is no apparent reason in equity why the employee should bear the consequences of accidents due to fortuitous occurrences or to the acts of fellow-workmen. It is the industry that causes these accidents, and the industry, in the person of the employer, ought to bear the cost of them. They should constitute a normal item in the cost of the production, like the breaking of machinery or any other incidental loss or damage. (169.)

Mr. LEO, president of the Builders' League, New York City, condemns strongly the employers' liability law which passed the New York senate in 1900, but died in the assembly. He says that under it the liability of employers for injuries to workmen would have been unlimited as to the amount and unlimited by any consideration of the fault of fellow-workmen. The witness mentions an experience of his own in which he fortunately discovered the drunken condition of a stationary engineer who was running a hoisting machine on one of his buildings, and who was said by the bricklayers to have been drunk for several days. This man was a member of a hoisting engineers' union and had been assigned by the union to the job. Mr. Leo promptly discharged him and the union sent another man in his place; but, though Mr. Leo courteously informed the union of the character of the discharged man, the drunkard had another job within three days. Under existing conditions of labor organization the employer is not responsible for the putting of such men in positions where they endanger the lives of others. The union is

responsible for it. Yet, under the proposed law, the employer would be liable for any resulting damage, and no excuse on account of the character of the engineer could have been pleaded. Furthermore, the proposed law would allow no contract by which an employer could give extra pay for extra-hazardous work, with the understanding that the workman should assume the risks.

Mr. Leo believes that 60 per cent of the accidents are due to the fault of the men who are injured, and that almost all are the fault of the injured men or their fellow-employees. Men often take chances, even contrary to orders. For instance, they will build a scaffold of 1-inch boards when they are told to use 2-inch plank, and when plenty of 2-inch plank is furnished.

The employers of New York were willing to compromise on the Massachusetts law, which, among other things, limits the amount of damages to \$5,000; but the workmen would listen to no compromise. (97, 100, 101.)

2. *Workmen's compensation acts.*—Mr. WILLOUGHBY points out that the legal insurance of workmen against accident furnishes a very interesting example of the evolution of a social problem. The old common-law liability of the employer was substantially the same in Europe as in the United States. The employer was responsible only for accidents resulting directly from his fault or the fault of his agent, whose orders the injured person was bound to obey. It was necessary for the employee to establish the employer's fault by positive proof. Accidents may be divided according to responsibility into five classes: First, those due to the employer's fault, provable; second, to the employer's fault, not provable; third, to causes inherent in the industry; fourth, fellow-employees' fault, and fifth, the injured employee's fault. The injured employee had to bear all except the first.

The first demand for reform was for the inversion of proof—that is, throwing the burden of proof on the employer and making him liable unless he could show that the damage resulted from the employee's fault. It soon became evident that this would be a very slight measure of reform. A very large part, approximately half, of all accidents are due to what is called trade risk; that is, to the conditions of the industry, without fault in any person and without possibility of prevention. The second step, then, was the demand that the employer should be responsible not only for all accidents that he could not prove were not due to his fault, but also for all accidents due to trade risks. The next step was to secure compensation for the employee without a lawsuit. Measures were taken for fixing in advance the amount of indemnity that should be paid in each class of accidents, and also to simplify judicial procedure by providing for boards of arbitration in which representatives of the employer and of the employee could determine the amount of indemnity due in each particular case, subject to appeal to the courts.

Germany was the first to take radical action for workmen's compensation. In 1884 it passed a law making it compulsory upon employers to insure practically all their employees against accidents. The entire burden of this insurance must be borne by the employers. Austria passed a similar law in 1887. It differs from the German law in that one-tenth of the insurance premiums may be deducted from the employees' wages, but in practice this is seldom done. Norway adopted a similar system in 1894, Finland in 1895, and Denmark in 1898.

Great Britain passed her workmen's compensation act in 1897. It accepts the principle of trade risk and compulsory compensation, excepting only accidents due to the serious or willful misconduct of the injured person. It rejects, however, the German system of compulsory insurance. The employer is free to insure against risk or to bear it himself. The act makes special provision for the organization of insurance institutions by the employers. Acts following the English system were passed by France and Italy in 1898 and by Spain in 1900.

The principle of compulsory compensation by employers for all accidents to workmen (with the exception in England of those due to the serious and willful misconduct of the injured person) has been accepted by practically all European countries. The only industrial country which has not accepted it is Belgium. In Belgium bills with this object have repeatedly been before Parliament and have been indorsed by practically all parties. They have failed of passage only because the two houses could not agree on particular details of organization. All the more dangerous industries are already covered in some way or other by insurance schemes. On the State railways there is practically compulsory compensation and insurance, and the insurance of miners, whose industry is very important in Belgium, has been compulsory for many years. Moreover, many manufacturers have voluntarily insured employees against accident, and Belgium has a national institution for the insurance of workmen against accident, of which employers make use. A similar condition of things existed in France before the compulsory-compensation law was passed.

Practically all industrial employments, including agriculture, are regularly included in the scheme. As a matter of practical policy it was found necessary to

begin at first with particular industries where the risk of accident was especially great. After the plan was organized and working, it was extended to other lines. In England agricultural laborers were included only by a law passed in 1900. Domestic and commercial employees, salesmen, etc., are not yet included. They are somewhat outside the contemplation of the scheme. The idea is to insure workmen against trade accidents; that is, risks incident to their employment. If a workman is injured going to or from his work, or at any other time than while engaged in it, he receives no compensation. The trade risk or risk of accident to the employee is very slight in the case of salesmen and domestics.

The almost invariable system is to divide accidents into the following classes:

First. Those causing death.

Second. Those causing total permanent invalidity.

Third. Those causing partial permanent invalidity.

Fourth. Those causing temporary invalidity, whether partial or total.

All of the laws in regard to class 4 provide a minimum—that is, only accidents causing disability over a certain number of days, or a certain number of weeks. In the German system the minimum is rather high—14 weeks—but this is due to the fact that Germany also has a system of compulsory insurance against sickness, and these minor accidents are taken care of by the sick fund. The same is true of Austria. Where a system of sick insurance does not exist, the minimum is usually a few days.

The scale of benefits is then fixed in about this way: In case of death, either a lump sum or a pension, where an insurance system is also provided for the widow or orphan; and in case of permanent disability, whether partial or total, a pension is paid the injured person. In the case of total invalidity the pension usually amounts to as much as two-thirds of the average wages that the person was earning. In case the disability is partial it is proportionate to the extent of the disability, and it is at this point that the use of the arbitration boards come in. They have to determine whether the disability is total or whether partial, and the extent of the disability. There is a right of appeal from the arbitration boards to the courts.

The indemnities are always proportionate to the wages of the employees. The dues of the employer, where insurance is compulsory, are proportionate to the total amount he pays out in wages. Since the risks are very different in different employments arrangements are made to insure the bearing by each industry of its own risks. In Germany the employers in each separate industry organize a separate insurance institution. In Austria the insurance institutions are territorial, but the premiums required of each employer are based on a coefficient of risk in his industry, based on statistical data.

The principles of this law seem to be universally accepted on the Continent as wholesome. In Great Britain some employers feel that an unjust burden has been placed upon them. Yet the evidence seems to show that even in Great Britain the acts are well received upon the whole, and that public opinion in their favor is growing. The expense of litigation and of damage suits has been materially lessened. It was quite usual in Great Britain for employers to insure against their liability under the older laws, and the premiums that they now have to pay are not so very much heavier than those they paid before. Employers' liability insurance is increasing quite rapidly in this country, but it does not in any degree take the place of workmen's compensation acts, like those of Europe. It is insurance for the benefit of the employer, and not in any degree for the benefit of the employee. It simply protects the employer from the burden of litigation and of any judgment that may be obtained against him. The workman gets nothing unless he gets it by legal proceedings.

There is no clear proof that carelessness has or has not been increased by the certainty of compensation for injuries. The officials who manage the State insurance institutions say that it has not; but it is a matter of personal opinion.

Because of the great decrease of litigation and the attendant expense, the increase of burden upon the employers is perhaps less than might be expected. So far as there is an increase, the witness thinks that it becomes a part of the ordinary cost of production, and is ultimately thrown upon the consumer, like other costs, as a part of the selling price. This is just and right, for the cost of accidents is properly an incidental expense of industry. (169-175.)

Mr. Willoughby thinks that any of our States would do well to take the British workman's compensation act as a model on which to base a law. He also suggests that Congress might pass an act regarding the liability of railroads for accidents to their employees. Such a law would be of great importance in itself, and would furnish an example for the States to follow. (170.)

8. *Benefit funds and associations.*—Mr. HARRAH, president of the Midvale Steel Company, says that his company conducts a benefit fund to which every man in

OXVIII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

the works, high or low, is compelled to pay 5 cents a week. The fines collected from the men, amounting, Mr. Harrah supposes, to \$5,000 or \$6,000 a year, also go to the fund. The fund is managed by the men through trustees whom they elect. A veto power is lodged in the manager of the company. Sick benefits are not paid except in special cases, but accident benefits are paid, and a physician is employed to attend to accidental injuries. The physician comes every day and has, on an average, 42 cases to attend to. Between 800 and 900 men are hurt at the Midvale works every year.

There is a separate assessment of death dues when a man is killed by which the widow receives some \$1,500 or \$1,600 in cash. (352.)

Mr. REDFIELD says that the employees of J. H. Williams & Co. have a mutual aid society supported and managed by themselves, to which practically all the employees belong. The only thing that the company has to do with the matter is to contribute a certain amount to the benefit fund every year in cash, to guarantee the safe-keeping of the funds and to have one of the officers of the company serve without pay as the treasurer of the association. The members pay weekly dues and the association pays a weekly benefit to members who are ill, and also pays death benefits. It employs a physician under salary to attend sick members. (357, 364.)

4. *Pensions.*—Mr. HARRAH says that when one of his employees becomes incapacitated by old age or sickness the company pays him wages during his life, usually at the highest rate he has received in the employ of the company. The list now contains, Mr. Harrah thinks, 13 or 14 men. The men do not like to go on the pension list; they consider it a disgrace. The company gives the old men light jobs, like gate tending, so far as they are able to attend to them. The knowledge that they will be looked after in old age makes the men reluctant to leave the employ of the company. (351, 352.)

G. *Convict labor.*—1. *Indiana law.*—Mr. McCORMACK, labor commissioner of Indiana, says that the legislature of 1898 passed a law looking to the abolition of the contract system of convict labor in that State. It is intended to substitute the State account system. The number of men allowed to any one contractor has already been restricted to 100. The kinds of industries that may be carried on in the penitentiary have also been restricted. A piece of land has been bought outside the prison, and it is proposed to employ a considerable number of the trusty convicts in working it. The prison will be supplied with vegetables, and the surplus can either be sold or sent to other State institutions. It is intended also to eliminate machinery as much as possible in the prison. It is believed that if the prisoners are confined to hand work, their position when they leave the prison will be better—they will have learned trades. (60, 61.)

2. *Interstate sale of goods.*—Mr. Fox, president of the Iron Molders' Union, feels that the competition of prison-made goods with goods made outside ought to be stopped, and in particular, that the more progressive States which have undertaken to stop it ought to be protected by national legislation prohibiting interstate commerce in convict-made goods. His own trade feels the competition of prison labor severely in some branches. The cast-iron hollow-ware trade is practically turned over to the prison factories, except in the high grades of ground hollow ware. Hollow ware is cast in the prisons of Pennsylvania, Illinois, and Ohio. The stove-plate branch has also suffered in the cheaper grades, but not so much. (147, 148.)

Mr. WILLIAM J. O'BRIEN, of the Granite Cutters' National Union, says that the law in the State of New York provides that the products of convict labor shall not be put on the open market, but must be utilized by the political subdivisions of the State. The convicts can not be farmed out or hired out to anybody. The products of convict labor from other States, however, can come into New York, and there ought to be a law providing that such goods be branded as convict goods. The legislature of New York passed such a law, but on a test case the law did not stand. (436, 437.)

H. *Free employment agencies.*—Mr. RIXEY, commissioner of labor statistics of Missouri, states that the last legislature passed a bill for the establishment of State free employment bureaus in cities of 100,000 inhabitants or over. Only Kansas City and St. Louis have heretofore come under the terms of the law. Employment bureaus have been established in these cities, each with a superintendent and a clerk. Mr. Rixey regards them as of the very highest importance to the welfare of the State. During the summer of 1900 the bureau at Kansas City sent 1,700 men to the harvest fields of Kansas. So these employment agencies may help to correct the unfortunate tendency of the people to crowd into the cities, as well as find employment for those out of work. Private employment agencies are inefficient, and in many cases fraudulent. (61, 75, 76.)

Professor COMMONS says that in New York City there is one State employment

bureau, three in Ohio, and one or more in Illinois. So far as he has observed them, they are inefficient, mainly because they are treated as political appointments. The difficulty is that the man in charge is not acquainted with employers in the neighborhood and does not know who want employees. Even in the absence of politics it will not generally be possible to get for an ordinary salary a superintendent who will have connections with employers. (89.)

Professor Commons says that he understands in Seattle there is a labor bureau in charge of an unsalaried board of business men. They appoint the agent who has active charge. He conducts the registrations and makes the acquaintance of employers. The oversight of the board of business men gives the bureau a prestige which it could scarcely get otherwise. (39.)

Professor Commons has found that the charitable associations which undertake to provide work and shelter and food for the unemployed are, so far as his experience has gone, very unsatisfactory. They are often imposed upon; they are not critical as to the worthiness of applicants. The man who takes an active part in the religious exercises is more apt to get work than one who does not. They usually degenerate into soup houses and indiscriminate relief. They encourage pauperism. The bottom of the trouble seems to be that men are put in charge who have made a record as good men in religious work, but who are not able to detect the frauds who come for relief. (39, 40.)

Bishop PORTER says: "My hope lies most in the individual. I am not a machine man. I do not believe in an institution of charity. An institution of charity is a mechanism which opens the door for personal contact, and I believe in the growth in the popular conscience of the community of a sense of personal responsibility and in the development of a capacity for service." (10.)

Mr. REYNOLDS, head worker of the University Settlement, New York, thinks that the New York State Employment Bureau amounts to very little. He has sent a few applicants to the office in order to test it, and he learns that it has practically become a woman's employment bureau, and the men need not apply. Mr. Reynolds believes that there is hardly anything for which greater need exists than an efficient labor bureau exchange. He would start a State employment bureau, largely as a bureau of information, requiring it to cooperate with all private bureaus, and then let it gradually and cautiously develop itself. (89, 95.)

Mr. Reynolds says that there have been a number of philanthropic employment agencies in our cities, and that many of them have failed. He believes that the reason is that they have omitted properly to classify their work. The unskilled labor rushes in, and the skilled labor and the clerical class shun the bureau because they feel that they would be lowered by connection with it. It is necessary to recognize the aristocratic feeling which exists among the workers, and which, to a certain extent, it is necessary for one in the upper grades to maintain if he is to have the respect of his employer and of his fellow-workers. There should be one bureau or one division for skilled labor, a second for mercantile labor, and a third for unskilled labor.

As to the private employment agencies run for profit, they are purely dishonest. They have a system by which they take a fee and send a man to a place where he is employed; he is kept for a week or two weeks and then discharged, and the next one comes in. Mr. Reynolds has known several such cases. (95.)

I. Cooperation and profit-sharing.—1. *Cooperation.*—Mr. NELSON, of the N. O. Nelson Manufacturing Company, gives details of the successful working of several cooperative enterprises in Great Britain and on the European Continent, including the cooperative wholesale and retail associations of England. He mentions, among successful cooperative stores in the United States, the Arlington, at Lawrence, Mass., and the Johnson County, at Olathe, Kans. He notes among the advantages of such cooperative stores that they sell only genuine goods, give honest weight and measure, and save for themselves the profits as well as the economies. The English associations pay 5 per cent interest on the share capital and set aside a portion as surplus, and then return dividends of from 10 to 15 per cent on the purchases. (359-361.)

Mr. WILLOUGHBY thinks that the ill-success of cooperation in the United States is due largely to the mobility of the workmen, to their habitual movement from establishment to establishment and from place to place. He mentions a development of cooperation which has taken place in Great Britain and France, in the taking of contracts for public work, as for the erection of a building or the plastering of it, by trade unions. In France the law provides that contracts shall be split up into such size that associations of workmen can bid on them, and also that such associations shall be exempt from the necessity of giving bonds, and from some other formalities which they are not in a position to meet. The building for social economy at the Paris Exposition was built entirely by associations

CXX INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

of workmen on this cooperative plan. The regulations provide that associations of workmen may bid on all kinds of contracts for the performance of work or for the furnishing of supplies, either for the central government or for the departments and the communes. (178.)

2. *Profit sharing.*—Professor GILMAN declares that profit sharing has a great advantage over productive cooperation in that it pays due respect to the two great principles of modern society which must find a *modus vivendi*—democracy and aristocracy. Our continual labor troubles signify that the democratic spirit has invaded the industrial world. Universal suffrage and political democracy have suggested a false analogy between Government and industry. There is a feeling that the factory and the countingroom can be and should be conducted on republican principles. Industrial success, however, requires a practical recognition of the superiority of head over hand for the good of both. The railroad and the mill must be governed by the able few if they are to give the best service to the many. The profit-sharing system leaves this natural aristocracy undisturbed. (366.)

Professor Gilman says that comparatively numerous cases of profit sharing have occurred in the United States, but that in a large proportion of these instances nothing like a thorough trial of the system was made. In some cases, the advertising motive was prominent in the adoption of it; in others, there was a general feeling of good will on the part of the employer, but almost absolute ignorance as to what had already been done in the field. Hence, mistakes were committed which would have been saved by a slight knowledge of the experience of others. The hostile attitude of the trade unions has in other cases compelled the abandonment of the plan. "The firm which takes up profit sharing seriously should make up its mind to a patient trial of the new way for a term of years; it should be willing to learn from experience, and fully realize that education is necessary for both parties, that they may not cherish unreasonable expectations and may learn to live up to the moral demands of the new situation." (367, 368.)

Professor Gilman points out that a system of profit sharing is not a commercial partnership under which the workmen inspect the books at their pleasure and have a voice in the management of the business. It is an industrial partnership only. The purpose of it is to incite a feeling of community of interest in the mind of the working man. So far as gain to the employer is to be expected, it is to come by greater economy, carefulness, and zeal on the part of the employee. In bad years as in good, the employee in a true industrial partnership is a successful maker of profit when compared with the ordinary wage-earner, and so far as his own power and responsibility are concerned. If the workmen were given the right to examine the books at any time, if they had a powerful voice in shaping the business policy, there might be reason and equity in expecting them to share the money loss of a bad year, out of their wages. So long as this is not done, their responsibility must in reason and equity be measured by the power allowed them. They make equal contributions to the success of the business: in a good year and in a bad one. If the commercial management of the business is successful, they receive the bonus they have earned; if not, they lose it. It would not be wise or right to expect them under such a system of industrial partnership to lose more. (364, 365.)

Professor Gilman refers in some detail to the instances of profit sharing which have made a marked success in France and in America. He gives a list of the concerns in the United States where some form of sharing of profits with employees was known to be in existence in November, 1899. He also refers to several writings of his own in which the history of the principles of profit sharing have been fully discussed. (362-370.)

Mr. NELSON says that his company adopted the plan of profit sharing in 1886 and founded the village of Leclaire in 1890. The immediate occasion of adopting profit sharing was the great railroad strike on the Southwestern railroads in the early part of 1886. Mr. Nelson's attention had for some years been drawn to the waste of capital and wages which repeated strikes involved, as well as to the mutual enmity of classes which they stirred up. His attention had also been attracted to several great profit-sharing cooperative enterprises, particularly those of Leclaire & Co., at Paris, and Godin & Co., at Guise, France, whose financial arrangements Mr. Nelson concisely details.

By the Godin and Leclaire plans the net profits, after allowing 5 per cent interest on the capital and some amounts for other purposes, are divided between the shareholders and the workers in the form of a percentage on the amounts received as dividends and as wages. Mr. Nelson says that his business was to some extent a trading one, and its earnings were large, compared to the capital. It was thought that it would be sufficiently liberal to set the wages of the employees against the capital itself. It was accordingly determined that the net profits, after allowing a commercial rate of interest on the capital, should be divided by equal percentage on

the salaries and wages of all employees and on the net cash capital of the company. This plan was first announced to the employees in March, 1896, and was applied to all profits from the beginning of that year. The employees were asked to select an auditor from their own number to examine the books at the end of the fiscal year and certify that the dividend had been properly made. The proposal was unconditional. No agreement or stipulation on the part of the employees was asked, and the men were not requested to work harder. The system was not, as a matter of fact, instituted with a view of getting more work or making more profit, though Mr. Nelson believes that even if this had been the motive it would have been best to leave the matter to the judgment and fairness of the people themselves, and though he believes that the quality of work will in the long run unavoidably be affected by a feeling of joint interest in the profits of the concern.

In the first year of the plan, the profits of the company were somewhat small, largely on account of the great railroad strike. The dividend on wages was 5 per cent; in the following year it was 10 per cent, and up to 1895 it varied from 5 to 10 per cent per annum. The first 3 years the dividends were paid in cash, with the privilege of investing in shares of the company. The management felt, however, that an average increase of 8 per cent in wages would mean in most cases a rise in the scale of living, which would have to be forcibly reduced when there should be no dividends, or when the employee should have to work elsewhere. The main value of the money, it was thought, would lie in making provision for the future. When by the experience of 3 years it had been shown that the dividends really meant money, the dividends for the future were made payable in shares of the company. No trouble or criticism ever occurred, or has occurred up to the present time. (358, 359, 360.)

Mr. Nelson says that in the years immediately following the adoption of profit sharing by his company, many others throughout the country adopted the plan; but most of them discontinued it after two or three years' trial, on the ground that they observed no improvement in the quality and quantity of the work. Mr. Nelson declares that no one should adopt the system except on the ground that is right to recognize the workers' interest in the joint outcome of the work. He would not advise the adoption of it with a view to making an additional profit larger than the amount paid in dividends. He believes, however, that the quality of work must in the long run be affected by a sense of personal interest, though it is impossible to decide whether each employee does a little better or a little worse. (359.)

Mr. Nelson says that two conditions only are necessary to the successful establishment of the profit-sharing plan: That the plan of distribution shall be stated in advance, and not be left to the good will or caprice of the employer, and that no counter conditions be exacted. If left to the option of the employer, after the profits have been made, the dividend comes as a gift. If the offer is coupled with conditions, it is open to the objection that it interferes with the rights of the employees. (360.)

Mr. WILLOUGHBY thinks that the greater success of profit sharing in Europe than in the United States is explained partly by the less independent feeling of the European workmen, and partly by the more permanent and less mobile conditions there. In Europe a workman remains for years in an establishment and becomes identified with it. In the United States a man does not know whether he will be working in a given place six months from now or not. It is a question whether it is desirable to limit the mobility or independence of the laborer and his ability to move from place to place and seek his advantage wherever he can find it. (178.)

IV. EDUCATION. INDUSTRIAL TRAINING.

A. Economy of education.—Mr. WOODS calls attention to the estimate of Professor Marshall that something like one-half of the best natural genius which is born in England is born among the working classes, and that a great part of this is lost through lack of opportunity. Only about 5 per cent of American children, says Mr. Woods, continue their education beyond the grammar school: a large part of the genius of our people is in the other 95 per cent, and much of it is wasted through lack of opportunity. The grammar school ought to be widened in the direction of manual training; and it would seem that money could not be better invested, from a public point of view, than in providing scholarships which should make it possible for bright and promising boys and girls, children of poor parents, to carry their education to the high-school stage and beyond. (202.)

Mr. WYCKOFF, referring to his experiment as an unskilled laborer, states that he believes that he had an advantage, by reason of being an educated man, in possessing a broader horizon. He believes that one serious disability attaching to a workman, even if he is free to go about, is a disability which may be called lack

of imagination. He has been accustomed to one form of employment, and he shrinks from venturing into an unknown world. An educated man is more likely to be free from this handicap. On the other hand, Mr. Wyckoff found that employers generally suspected him of being an educated man and of having reached the position of an unskilled laborer through some discreditable cause, such as dissipation or dishonesty. The workmen themselves among whom he was thrown did not seem to suspect that he was a man of education; they appeared to think him some new sort of immigrant. The unskilled workmen in this country are so mixed a class that such an experiment as Mr. Wyckoff's can be carried out much more easily here than in a country where the laboring population is more homogeneous.

Mr. Wyckoff admits that he had a further advantage over the ordinary unskilled workman in that he had certain defined objects in view. He wanted to retain his work, and he wanted to see whether in each particular form of employment there were any chances of improvement of position. (185, 186.)

Professor COMMONS says that in 1897 the Association for Improving the Condition of the Poor made an investigation of the reason why the farming people of New York State flock to the cities. They found that 36 per cent of the children of farmers refused to stay on the farms. But in the section of the State around Cornell University no such condition of things existed. There, through the activity of the experiment station, the farmers have been educated in scientific agriculture, and agriculture has been made both interesting and profitable.

B. Public Schools.—1. *Defects in public-school system.*—Mr. REYNOLDS says that more than 55 per cent of the children must earn their livelihood with their hands, and that when they leave the public schools they are absolutely incapable of using their hands for any purpose whatever. In his work in the University Settlement, New York, many boys and girls are sent to him in the hope that he can get work for them. They come about the age of 14, when they leave the public schools. He asks them what they can do; the regular answer is "nothing." He asks what they want; they want to get into a store. (87, 88.)

2. *Technical education in the public schools.*—Mr. MILLER, principal of the School of Industrial Art, Philadelphia, does not believe in the introduction of professional studies into the common or high schools. He would not, for instance, approve of an attempt to give any special preparation for the work of his own school in the ordinary high schools. Aside from the waste of effort in trying to educate in a particular direction those who have no natural aptitude for it he believes that success in the industry depends on a cultivation of the general powers, which is given more effectively by a less direct method. For example, in textile work a great deal of calculating must be done; yet he believes a boy will get a better preparation for that in the high school by a more general course of mathematics, than if he were all the time occupied with textile calculations. He will go further in textile calculations at the end of his high-school course than if he took the textile calculations alone. His mind will be more developed and more active. In the same way, in designing, a student who tries to specialize, even in a school like Mr. Miller's, one who feels that he wishes to learn only about one kind of fabric, does not get as far at the end of the year, even in that particular line, as one who takes a regular course and develops his mind in a more general way. What is needed is mental attainment rather than specific information.

At the same time, Mr. Miller believes that the instruction now given in the public schools might be modified with advantage in an industrial direction, not as a matter of specialization, but by diminishing existing specialization in other directions. For instance, he finds text-books of arithmetic almost wholly occupied with mercantile problems, calculations of profits, and brokerage. He believes that an arithmetic written on proper lines would be largely occupied with calculations of speeds of machinery and with problems that would lead the student's mind to work in industrial directions quite as much as on purely mercantile problems. In connection with questions of this sort, teachers who are themselves informed regarding the different industries could give a great deal of information about industrial work and could give the right direction to minds that are industrially inclined. (225, 226.)

3. *Schools in New York City.*—Mr. BLAUSTEIN complains that there are not enough schools in New York City. In some cases there are half-day schools, where one set of children go in the morning and another in the afternoon. That leaves the children on the street the most of the time. The night schools also ought to be kept open throughout the whole year instead of only in the winter. (126.)

C. Industrial and technical Education.—1. *Advantages.*—Mr. HARRAH, president of the Midvale Steel Company, considers the development of manual training schools one of the most important things to which the attention of the country can be given. (353, 358.)

Mr. SIMEON B. CHASE, treasurer of the King Philip Cotton Mills, believes that the establishment of textile schools in this country will result in educating skilled workmen and in improving the quality, quantity, and economy of textile production. (580.)

Hon. WILLIAM W. CRAPO, president of the Wamsutta and Acushnet Mills, thinks that a very hopeful indication of our continued proficiency in the manufacture of textile goods is to be found in the establishment of textile schools. (586.)

Mr. JOHN HOPEWELL, a manufacturer of Boston, says that because of the very fine textile schools which there are in Germany, that country has made much more rapid advance in the manufacture of textiles and in all kinds of manufacture than has any other foreign country. The American people have begun to wake up to the importance of textile schools, and some have been established in this country. (527.)

Mr. LEAKE, a manufacturer of cotton and linen goods, says that the Philadelphia Textile School has been a benefit to those who have been wise enough to appreciate it. The importance of education in designing and in the manipulation of material and of machinery can not be overestimated. Yet the shops must keep ahead of the schools. The curriculum of the schools must follow actual practice. (276, 277.)

Mr. MILLER, principal of the School of Industrial Art, Philadelphia, thinks that industrial schools are not likely to be established in too great numbers. Conducted largely as evening classes, in places where they draw a clientele of operatives and workmen, there is no limit to their field. Indeed, wherever a community has a distinct industrial character of a given type, Mr. Miller thinks it the duty of the State to assist both the industry and the industrials by provisions for instruction which they can appreciate and apply; but the pupils of such schools will be mainly men who are actually engaged in the industry, and the main reliance must be placed on night schools, with the addition, when it is possible, of Sunday schools. Such institutions would not take up chemistry and dyeing, or carding and spinning, nor the general questions of designing, form, and color; they would be essentially weaving schools, like those abroad.

With regard to schools of the character of the School of Industrial Arts at Philadelphia, which give a highly specialized training, the establishment of them might easily be overdone. The number of those who can profitably apply such specialized training must remain comparatively limited. A few schools of this character are needed in the country, but a few strong ones would be better than many weak ones. (226, 229.)

2. *Philadelphia School of Industrial Art.*—Mr. MILLER, principal of the School of Industrial Art, Philadelphia, says that this school was established to perpetuate the lessons of the Centennial Exposition of 1876. A collection, as the nucleus of a museum was made at the exposition itself, and has grown by purchases, loans, gifts, and bequests until it forms a large and creditable collection of works of industrial art. The institution was incorporated as the Pennsylvania Museum and School of Industrial Art. The school itself was opened in 1877. It was at first a school of drawing only. Mr. Miller was invited to take charge of it in 1880. He was at first the only teacher. The number of students was small, but in a year or two Mr. Miller was able to show the men of Philadelphia to whom he appealed for a larger support the direction which he thought a school of industry ought to take. He heard that there was a purpose on foot among the manufacturers to establish a textile school. A fund of about \$28,000 had been raised for this purpose. Mr. Miller succeeded in having the textile school established as a department of the School of Industrial Art in the year 1884. The work of the art school had in the meantime been developing in the direction of industrial designing. A school of carving has been added. Modeling is taught with reference both to architectural ornamentation and to pottery. Designing is also taught in its application to surface decoration, as by printing on papers and textures of all kinds. Instruction in leather work, as applied to bookbinding, is given, though the purpose of this is to secure familiarity with the material and with design as applied to it, rather than to make bookbinders. The school now occupies a whole Philadelphia square, say 200 feet by 400 feet. Its building is four stories high, including the basement. It was supported up to 1887 entirely by private subscriptions. In that year an appropriation of \$10,000 was made by the legislature. This appropriation has been continued and increased until in recent years it has been \$20,000 or more. Ten thousand dollars a year is now contributed by the city of Philadelphia. The fees amount to some 17,000 a year, so that the annual resources of the school are between \$40,000 and \$50,000. An endowment fund of about \$100,000 has been accumulated. The tuition fees in the day classes of the art school are \$60 a year, and in the textile school \$150 a year. In the evening course in both schools the fees are nominal.

CXXIV INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

The school appeals to two rather distinct classes of pupils, one in the day class and one in the evening class. The two sets are substantially equal in number. The evening classes are composed largely of working men and women actually engaged in the mills. They are mostly men of fairly good position in the mills, draughtsmen in offices, bosses in one department or another. The day classes in the textile school are composed almost exclusively of young men, and largely of young men of good families and education. Many of them are college men, some of them college graduates. The entrance requirements do not require college education, but the college men can avail themselves of the opportunities of the school more fully than anybody else and get more out of it. In the day class in the art schools the sexes are about equally divided, with possibly a slight preponderance of women. The entrance examination supposes graduation from a grammar school, but a large percentage of the pupils are considerably more advanced than that, many of them high school graduates. The appropriation from the city of Philadelphia is coupled with a provision for a certain number of free scholarships for pupils from the several grammar, high, and manual-training schools of the city. The grammar school students are chosen by competitive examination, and those from the high and manual-training schools are accepted on the recommendation of the faculty. The appropriation by the State of Pennsylvania is accompanied with a provision for one free scholarship for each county, and in the case of counties which have more than one State senator a scholarship for each senatorial district. The appointments to these scholarships are made by the governor without legal restriction, but largely in practice on the recommendation of legislators. Mr. Miller says that these, the persons received on appointments, often without any direct preparation for the work of the school, have on the whole been quite as satisfactory a class of students as those who have prepared in the city schools, and have obtained the scholarships by competitive examination or have been recommended by the faculties of the high schools.

The work throughout is intended to develop originality in the pupil as well as to give him a knowledge of historic styles and an acquaintance with materials and methods. Even in drawing from life in the art school the pupils are encouraged to make original compositions, based upon the posing of the model rather than simply to copy the model as a cast might be copied. In the posing itself the pupils are invited to assist. A considerable part of the instruction is given by persons who have achieved practical success in the industrial application of the arts of design; for instance, the advanced class in applied design is conducted by a woman who has for several years maintained a very successful factory for making stained glass windows. She was qualified for her work by instruction received in the school.

Students in the art school have a certain amount of instruction in the chemistry of pigments. There is also a school of modern languages in which French, German, and Spanish are taught, and an effort is made to have every student devote some hours each week to at least one of these languages.

A certain amount of the teaching is common to both the textile and the art school. Many scholars who come for the textile school work find that the instruction of the art school is really of greater value to them. It is not possible for the textile school student to avoid taking a good deal of the art school work.

In the textile school the finished fabric is the starting point of instruction. The pupil is taught to analyze it, both in a material sense, and with reference to effect. He learns to classify effects as well as materials and to vary them, much as he would vary effects in studying music. He learns themes and the treatment of them, and learns to make his own variations. The first year in the textile school is largely devoted to single cloths, hand weaving, and general design. The second year is devoted to double cloths, Jacquard, and dyeing. In the third year, the pupil perfects himself in some special branch, carpets or gauzes, or whatever line he expects to follow. The men who stay 3 years usually have such connections, family or other, as to enable them to see pretty clearly what their careers are likely to be, and they like to specialize with reference to that. The course of chemistry is very thorough so far as its application to textiles is concerned. Mr. Miller speaks of a man who graduated from one of the smaller colleges, took a special course of chemistry at Harvard, and then came to the textile school to specialize on textile chemistry. A part of the student's time is spent throughout in the designing room, or in making calculations for analysts and in performing experiments in the laboratory; and a part is spent in experiments on the loom, working at the principles he has acquired in the class room. He learns to adjust a loom to weave any piece of goods. He learns to detect flaws, to find out why the loom fails, and to remedy defects. When the loom works right and produces perfect goods, he is ready to cut out that piece and change the warp and make a new thing. The actual running of the loom forms no part of his work. The pur-

pose of the school is not to produce fabrics, but to teach men how to produce fabrics. The attempt is, of course, made to emphasize excellence and permanence in coloring and dyeing, but the school does not fail to face the necessities of competition. The whole of the textile work, including dyeing, is taught as in the presence of the commercial problem. Mr. Miller is afraid that in actual practice commercial considerations of cheapness, rather than considerations of excellence, nearly always determine the choice of methods. Changes in methods of dyeing which are exploited as improvements are too often, he fears, changes which reduce cost rather than secure permanency.

Mr. Miller thinks there is no class of fabrics on which mills are running in this country for which the work of the school is not a more or less adequate preparation, except lace curtains. (218-228.)

3. *New Bedford Textile School.*—Mr. CHRISTOPHER PARKINSON BROOKS, director of the New Bedford Textile School, says that the New Bedford Textile School was opened in October, 1899. The land was purchased and the building erected out of an appropriation of \$25,000 by the State and of \$25,000 by the city of New Bedford. The school has been equipped largely through donations from manufacturers of machinery, almost \$20,000 worth of machinery having been given. The course of instruction includes all branches of the manufacture of cotton cloth, from the raw material to the fabric, including designing, mechanical drawing, engineering, and subjects allied to it. The first year the school had nearly 300 students; the current year it has an enrollment of 301 students. The students are of two classes, day students and evening students. Probably 90 per cent of the evening students are workers in the mills, and altogether represent some 50 different occupations. The ages vary from 14 to 50. In the evening classes of elementary arithmetic and drawing are taught. Both sexes are admitted as pupils, but there are not more than 10 women in the school and they are in the drawing class. The tuition for day students is \$100 a year for residents of Massachusetts and \$150 a year for students outside the State. The tuition is fixed by statute. In the case of evening pupils a nominal charge of \$5 a year is made. Since the original appropriations the school has had an appropriation of \$18,000 from the State and one of \$7,000 from the city. It is hoped that these appropriations will be annual for some years.

Certain kinds of cotton fabrics, such as laces, embroideries, hosiery, etc., are imported into this country to the value of about \$40,000,000 per annum. It is hoped gradually to add to the departments in the school so that it will be possible to train the pupils to manufacture goods of this character. By the establishment of this school the manufacturers will ultimately be enabled to get skilled help, such as designers, overseers, and superintendents, without having to go abroad for them. The formation of large industrial combinations will call for an increased skill, and if these concerns do not organize technical schools themselves for the benefit of their employees, as has been done abroad in some cases, it will be necessary for the State or National Government to do so.

Some of the students in the New Bedford school have been through manual training schools, and are somewhat better prepared to receive instruction than they otherwise would be; but not sufficiently so as to warrant their having to spend perhaps two years in a manual training school. It is desirable that the curriculum of the public schools be somewhat modified so as to be better adapted to local needs.

In Mr. Brooks's opinion there is no textile school, either in America or abroad, that has as satisfactory and varied an equipment as the New Bedford school, for the giving of instruction in the manufacture of cotton fabrics. (553-554.)

4. *Industrial education in foreign countries.*—Mr. MILLER says that there are only a very few schools abroad like the one at Crefeldt, which do a work similar to that done by the Philadelphia School of Industrial Art. There are only two textile schools in France which he knows much about, and they are mostly weaving schools. Those in Germany are very largely the same. They are not meant for designers or superintendents, but for developing a high class of operatives. (229.)

5. *Apprenticeship.*—Mr. CRESSON, a manufacturer of transmission machinery, says that the old apprenticeship system, under which apprentices were taken into the family of the employer, is now impossible. Mr. Cresson used to take boys for 5 years; but when they had been with him about 3½ years they would leave him and hire out as journeymen; so he had to give up the plan. He has a number of boys in a certain part of the shop where they are treated in a measure as apprentices, and trained to become foremen and underforemen. (270.)

Mr. HARRAH says that in the works of the Midvale Steel Company, out of some 8,400 employees only about 80 are boys. When a boy comes to the company his father or mother signs an indenture, binding the boy to the company for a period of 8 years, which will expire when he is 21 years old. The boy is taught to be a molder, or a melter, or a machine hand, or a carpenter, or a pattern maker, or a

CXXVI INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

chemist, or whatever it may be. He is paid 6 cents an hour at first, with gradual increase to 8 cents an hour. Part of the money is paid to him and part to his mother, and he is compelled to put a part in a savings fund. The Franklin Institute has a branch near the works, and the boys are compelled to attend night school there. The company pays their tuition, and pays for their time at the night school just the same as while they are at work. When they come of age the boys generally like to stay with the company, and become inspectors and foremen. They usually fill those places excellently. Mr. Harrah likes, however, to get them into the employ of other companies, in order that the Midvale Steel Company may have friends and not enemies in the establishments it deals with. (351, 352.)

D. Libraries.—Mr. REDFIELD says that a circulating library for the use of employees has been installed by J. H. Williams & Co. From the time of the opening of the library there has been a strong demand on the part of the men not only for books but for good books. Experience has shown a circulation equal to the use of half the books in the library monthly. (359.)

V. IMMIGRATION.

A. Successive nationalities of immigrants.—Mr. REYNOLDS says that 50 years ago the part of New York just east of the Bowery, where the University Settlement now stands, was an American quarter, and the dwelling place of some of the wealthy families of the city. About that time the Irish immigration began, and the Irish pushed the Americans uptown. Then the Germans came and drove the Irish uptown. About the time the University Settlement was established, say in 1877, the Russian and Polish Jews came and crowded out the Germans. That particular region is now practically monopolized by Russian and Polish and Armenian Jews. In the public school directly opposite the University Settlement, from 97 to 98 per cent of the children are Jewish, and the same is true of several other schools in the vicinity. Within the last 3 years the Italians have begun to press into the quarter. The Italian community in Greater New York is said to number from 150,000 to 200,000 people. Farther downtown small detachments of Syrians, Greeks, and Armenians may be found. (82, 94.)

B. Influences which promote immigration.—1. *Influence of prosperity.*—Professor COMMONS shows a chart in which the number of immigrants to the United States, year by year, is compared with the average level of prices. It appears that as prices rise, indicating an increase of prosperity, the number of immigrants rises also.

The labor-union people say, in the present period of prosperity, that, on account of the immigration they have been unable to get any increase in wages commensurate with the increase in prices. (43, 44.)

2. *Efforts of steamship companies.*—Mr. BLAUSTEIN refers to the stimulation of immigration by steamship companies, which circulate rumors of golden opportunities in the United States and Canada. He thinks this influence is largely responsible for the large emigration of Jews from Roumania. (122.)

3. *Oppression abroad.*—Mr. BLAUSTEIN refers in detail to the gross oppression to which Roumanian Jews are subjected in their own country, and which is said to have driven out 50,000 between January 1 and August 1, 1900. (122, 123.)

C. Character and condition of immigrants.—1. *Economic condition of Jewish immigrants.*—Mr. BLAUSTEIN says that a great deal of the Jewish immigration is effected by family assistance. One member of a family will come and work and save until he can buy a ticket on the installment plan to send for another. Then the rest of the family will gradually be brought over. The newly arrived immigrant has generally a relative here, who will take care of him for a few weeks or months, until he can get a start. Otherwise there will be a little colony of people from the same city or from the same country, and they will help the newcomer for the first 6 months or so. If even this society can not take care of the immigrant he will be referred to the United Hebrew Charities. The United Hebrew Charities, however, does not, as a rule, help newly arrived immigrants except with work. If they are not able to support themselves by work, or are likely, in the opinion of the Charities, to become a public charge, the Charities will report them to the authorities, and they will be sent back. If they have smuggled out of Russia they must smuggle back again.

The United Hebrew Charities very seldom receives applications for help from people who have been 5 years or even 2 years in this country. After being here 2 years they seem to get along by themselves. Very few Jews receive help from the public authorities in New York or from the nonsectarian charities. (119, 121, 123.)

Mr. Blaustein says that a large part of the Jewish immigrants have trades. They are tailors, shoemakers, carpenters, painters. A tailor or shoemaker can not follow his trade in this country because of the factory system. As to agriculture, very few have been agriculturists because in Europe a Jew can not be an agriculturist. Some of them have been small shopkeepers. The employments that are most readily open to them here, aside from sweat-shop work, are the keeping of a little store or a stand, or peddling. Many work in the factories. (120, 121.)

2. *Desire for education.*—Mr. BLAUSTEIN says that when the evening classes of the Educational Alliance of New York were opened in October, 1899, the "building was mobbed." Probably 2,000 people asked for admission to the classes, and everyone was at least 35 years old. (119.)

3. *Criminality of foreign born.*—Professor COMMONS criticises the ordinary figures as to the criminality of the foreign born as compared with the native born. Crime is a phenomenon of adults, and principally of male adults. As most foreigners come to this country after they are 15 or 18 years of age, the proportion of adults among them is much larger than among the natives. Some 47 per cent of native-born Americans are of age, and some 85 per cent of foreign born; so the foreigners might have nearly twice as many criminals as the native-born, as compared with the total number, and yet have only about the same proportion of criminals among adults. Professor Commons thinks that foreigners and children of foreigners contribute more largely to the minor crimes and misdemeanors, drunkenness, etc., than to the serious crimes. But the native-born children of foreigners are the worst element. They are the hoodlums and bums. The tramps are largely of American stock. The reason for the troublesome character of the children of foreigners seems to be that the father and mother, perhaps unable to speak English, are at a disadvantage in an American community. In their own country, knowing the neighborhood and the surroundings, they would have been able to keep the children under control. (43, 45.)

D. *Effects of immigration.*—1. *General evil effects.*—Mr. REYNOLDS says that the intruding immigration is the great cause of the depression of wages and of such bad general conditions as appear in the sweated industries. One of the worst features of it is that the immigrants of each race settle in undigested masses in our great cities. Under these circumstances they become assimilated to the American life only very slowly. Among the children, especially, there is a strong tendency to moral degeneration. The people have been torn away from the moral traditions of their old country, and they have not yet adjusted themselves to the conditions and the moral traditions of the new. There is a relaxation of the feelings of moral obligation. It takes a considerable time to gain a new hold of moral principles and moral ideas. The Jewish population of New York is astonishingly industrious and astonishingly ambitious for education. It has done much to raise itself out of the mire. The trade unions have become a little stronger, and general conditions have made some slight progress. But now come the Italians, crowding into the garment-making trade and throwing themselves on the necks of the Jewish garment workers before the Jewish garment workers have sufficiently established themselves to cope with the dangers and evils of this new immigration. (90, 92, 93.)

Mr. Reynolds mentions three great evils under which the Italian immigrants in Greater New York labor: first, the sweatshop; second, the private bank fraudulently conducted by one of their countrymen—a special evil peculiar to the Italian people, and, third, the padrone system. (94.)

2. *Race colonies.*—Mr. WYCKOFF comments on the national clannishness of immigrants, which results in the formation of distinct colonies of particular races in our great cities. He adds that the same thing occurs in the farming communities of the West, where he found in some places Scandinavian communities in which even the teaching was in the native tongue of the settlers. In other places there were French settlements and German settlements. He regards this colonization in city or country as a decided hindrance to the assimilation of immigrants and their children by the American nationality. The separateness is more readily maintained in the country, however, because in the city the conditions of work compel the intermingling of the different races. Yet even in the country the actual process of assimilation seems to be very rapid. Children of foreign ancestors in many instances show the emergence of distinctly American traits. (194, 195.)

3. *Moral deterioration of immigrants.*—Mr. BLAUSTEIN says that the Jews who have come to America are better off materially, but it is their unanimous opinion that in a moral way they are worse off. They regret that they can not live up to their moral convictions here. Circumstances result in the revolutionizing of their moral ideas. For the Russian or Polish Jew at home it would be a material disad-

vantage to be irreligious. He would lose if he kept his store open on the Sabbath. But in America he finds that he is at a disadvantage if he keeps it closed. The Russian Jew, like all Russians, considers czarism divine. He comes here and sees the head of the nation ridiculed and caricatured. Moreover, he finds that the police, who immediately represent the Government to him, are corrupt. He loses all respect for authority.

On the other hand, those who have held radical opinions, perhaps anarchical opinions, in Russia, where argument is silenced by the prison, often become much more conservative under the experience of freedom. Mr. Blaustein cites a class of about 200 young people, every one of whom was radical 2 years ago; they were "anarchists in theory. They were discussing free love, and did not hesitate to discuss any subject in the world, but they have changed around and have become imbued with the spirit of patriotism and altruism." (118, 119, 125.)

4. *Moral separation of parents and children.*—Mr. REYNOLDS says that an unfortunate line of division arises between foreign parents and their children. The parents come to this country without knowledge of the language, and do not easily acquire it; the children, in the public schools, acquire the language of the country and become interpreters for their parents. At a very immature age they feel themselves superior to their parents. They become rather ashamed of them, and Mr. Reynolds regards this as one of the most unfortunate circumstances which he meets with in his work. (82.)

Mr. BLAUSTEIN says that children of immigrants, speaking English while their parents do not, lose all respect for their parents and for their parents' religious opinions. Conflict arises between the older and the younger generation. (115.)

E. Contract labor.—Mr. STEEL, a manufacturer of worsted and woolen goods, believes that the contract-labor law is a great injury to this country. People who are making a living abroad, particularly if they have families, are not inclined to take the risk of coming to America to get work. The consequence is that the more capable and better class of work people remain there, and there is always a surplus of them while the other class come largely to this country. If Mr. Steel could have brought from England, say 25 or 30 capable mill people, he could have started his mill here much more quickly and better, and could also have used these people in teaching others. He advertised in the Yorkshire papers, giving a description of the town, the wages, and the cost of living, but never had an application from a single person to come here. He does not think that the alien contract-labor law is an advantage to the working people of America. He believes that the importation of the best class of foreign working people would help in the education of the American workers, and that no considerable displacement of American workmen would take place, because there is a demand in this country for highly skilled labor that we have great difficulty in supplying. The effect on this country would be to create a higher degree of skill. The law could be safely amended so as to permit the importation of skilled laborers under contract for improving the processes of production in existing industries. The present law permits the importation of contract laborers for the establishment of new industries, but there is now little possibility of establishing new industries here. Mr. Steel adds that such an amendment as he suggests would "relieve the labor element of foreign countries of a large surplus that is always out of work, and in that way tend to equalize the wages in the different countries; and in that case, I think, there would be really less necessity for the tariff." It is true that some unfair manufacturers would take advantage of such a loophole in the law, and use the foreign supply to reduce the wages of American labor, and it would be unfair in the abstract that the manufacturer should have the protection of a tariff on his manufactured goods and the laborer should have no protection against imported labor; but the disadvantages would gradually disappear. (238, 241-246.)

Mr. WILLIAM BARBOUR, president of the Linen Thread Company, says that it would be to the interest of the manufacturers of linen thread if the law prohibiting the contracting for labor abroad could be somewhat modified. It is difficult to obtain women in this country who are willing to work as spinners in a flax mill, and there have been times when, for the lack of 2 or 3 spinners, some 25 women employed in other branches of the linen-thread industry have been thrown out of work. It is right that there should be a law putting restrictions upon the importation of labor, but certain changes in the administration of the present law could be made with advantage. It seems as though it would be practicable to allow a reputable manufacturer to give a bond whenever he wishes to import laborers, setting forth the names of the particular individuals whom he wants to come into this country, obliging him, if necessary, to lodge with the Treasury Department his reason for wanting those particular persons to come. (725.)

Mr. LINCOLN GODFREY, president of the Eddystone Manufacturing Company, says that the broad principle of giving protection to labor is right, but that the working of our contract-labor law, as applied to skilled labor, is very injurious to the finer lines of the textile industry in this country. It has been frequently found that not enough skilled labor could be secured in the United States. For skilled labor there should be some modifications of the law. Some skilled laborers do come to this country from other countries of their own accord, but not to the extent that the development of the industry in the last few years has required. A man who has a family hesitates to start out and come to this country. If he knew that there were employment for him here he would come. American young men do not want to give the time necessary for becoming trained. For an engraver or for a printer the time of apprenticeship is 7 years. (479, 480.)

Mr. JAMES WHITEHEAD, representative of the Weavers' Progressive Association of Fall River, says that he is totally opposed to the importation of contract labor. Workmen who are citizens are sometimes thrown out of employment to make room for persons who have no interest in the community. Sometimes the contractor is the only person that reaps any benefit. He hires the laborers at very small wages and makes considerably more money out of it than the laborer does. (574.)

Mr. McCORMACK, labor commissioner of Indiana, testifies that the law of that State prohibits the importation of aliens by employers, whether from other States or from foreign countries. (56.)

F. Restriction of immigration.—1. *Advocated.*—Mr. RIXEY thinks that the population of this country is now "as large as we need." He would not prohibit immigration altogether, but he would "be very particular about who came." He considers that almost anyone who wants to come, except Chinamen, can get in under our present laws. (76.)

Mr. THOMAS O'DONNELLI, secretary of the Fall River Mule Spinners' Association, says that he thinks there should be some restrictions placed on immigration. When there have been such industrial depressions in this country as there have been at intervals during the last 25 years, it is not right to allow an influx of labor, and provision should be made to restrict immigration at some times, though not at all times. Very few immigrants are now coming in to work in the cotton mills. The trade in Great Britain has been very good for some years, and the wages have been high, comparing favorably with wages in this country when purchasing power is taken into consideration. A large number of Poles are coming now to Fall River, and some are coming to work in the cotton mills. There may be individual cases where the immigrants work for lower wages than are generally paid, but there is a general wage schedule in the mills. Most of the employees of the cotton mills are English-speaking people and French Canadians. (568, 569.)

Mr. WILLIAM J. O'BRIEN, of the Granite Cutters' National Union, says that there ought to be further restriction of immigration. There is no objection to the coming of skilled workers to this country, but there is objection to having indigent people brought here. If so large a number of skilled workers came over as to overstock the market, a demand for skilled workers would be created on the other side, and they would go back. If the United States Government took proper steps to investigate immigrants, much good could be accomplished. Would-be immigrants should be compelled to make application to American consuls before they sail for this country, and the Government should have representatives in certain locations abroad to investigate persons proposing to emigrate to the United States. These agents should not be known as agents, but should work as detectives. A small head tax on immigrants would be a benefit and would help to pay some of the expense of putting in effect a better system of oversight. As matters are now the provisions of the contract-labor law are often violated. (483, 484.)

2. *Depreciated.*—Mr. McCORMACK considers that the present restrictions of immigration are severe enough, providing they are enforced. He sees somewhat frequent complaints in the labor papers that they are not enforced, but has no specific instance in mind. So far as there is a lack of enforcement, he believes it is due to lack of attention on the part of the officers, and not to corruption. (56, 57.)

Mr. BLAUSTEIN does not favor restriction of immigration. The immigrant is likely to be of an adventurous disposition and a man who will be useful to the country. If he comes to escape oppression, he brings the germs of liberty with him. (125.)

Mr. Blaustein says that the requirement of an ability to read one language would not debar the Jewish immigrants. The Russian Jews may not be able to read Russian, but they can read and write Hebrew. (119.)

Mr. COLLINS, a shoe laster, while admitting that immigration lowers wages, would give every man the same right to go where he likes, which Mr. Collins

CXXX INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

desires for himself. His remedy for the evil results of immigration is labor organization. The Philadelphia shoe manufacturers brought over some Italian shoemakers some 12 years ago. The shoemakers made the mistake of abusing them and showing hostility to them; but many of them are now in the unions. (809.)

3. *Attitude of trade unions.*—Mrs. SYMONDS, labor editor of the Philadelphia Inquirer, says that the sentiment of the rank and file of the labor organizations is divided on restriction of immigration; partly, perhaps, because so many of the members are themselves foreigners, to whom it does not seem fair that they, having got in and bettered their condition, should forbid others to come in. At the same time some of the most strenuous advocates of drastic restriction of immigration are themselves naturalized citizens. Mrs. Symonds has observed similar phenomena in patriotic societies. "A good many of the men who are so awfully American and want to reject everything that is foreign" are themselves only one remove from foreign soil.

The alien contract labor law ought to be more rigidly enforced; there are too many loopholes in it. Mrs. Symonds refers to the recent case of the Philadelphia lace workers, in which persons under contract to labor were admitted on the ground that they came to establish a new industry, though Mrs. Symonds believes there were lace-curtain operatives and lace makers already in Philadelphia who could do the same work. (264, 265.)

G. *Special problems.*—1. *Assimilation.*—Mr. REYNOLDS notes as an example for us the course of the Germans in dealing with Alsace-Lorraine. They sent their best officials there, in order that the work of assimilation might be done under the wisest possible administration. Our problem in assimilating large masses of foreign populations is substantially the same. We ought to put our best school buildings, with the best equipment and most skillful teachers, among the foreign-born population. We ought to put there the wisest and best officials in every department of administration. Our actual policy is the opposite. The best schools, the best teachers, the best officials, are found in the better districts. Here and there teachers of the very best caliber come into the poor quarters as a matter of personal self-denial, but there is no steady policy in any city in America directed to giving the best opportunities to those whose needs are greatest. (92, 93.)

Mr. WOODS says that while it is highly important to assimilate the immigrants, in all respects, to our American life, it is most vital that they be held to our American economic standards. For this purpose wise protective factory legislation should be universally enacted, and the peaceful carrying out of the policy of the trade unions should receive all possible encouragement by law. (202.)

2. *Distribution.*—Mr. BLAUSTEIN thinks the great harm of immigration comes from the settling of large numbers in particular spots, especially in New York. There ought to be a bureau of transportation and employment which should scatter the immigrants. The immigrant is like a child when he first lands. He is ready to be directed and to go where he is advised. He ought to be looked after as a child is looked after. (125, 126.)

3. *Naturalization.*—Mr. BLAUSTEIN says that it would perhaps be advisable that no naturalization papers be given to an applicant unless he presents a certificate showing that he has attended school in Europe or a night school here, and that he has really become acquainted with American institutions. The examination for naturalization should mean something. The standard of naturalization should be raised. The present examination is a farce. Pains ought to be taken also to imbue immigrants with the American spirit. Literature suitable for preparing the immigrant for American conditions ought to be provided in the various languages and given to him free, both when he lands and before he arrives. (125, 126.)

VI. LABOR ORGANIZATIONS.

A. *Effects of unionism. Advantages and disadvantages.*—1. *General advantages.*—Mr. COLLINS, a shoelaster, believes that the complete organization of workmen offers the only hope of material improvement in their conditions. Laws are of no value because they are not enforced except as labor organizations acquire strength enough to enforce them. As an ultimate solution of the labor problem Mr. Collins hopes for a radical change of the industrial system. "I believe some day we are going to have complete organization of each industry, and at that time we will inaugurate a general strike, and we will just shut out all our employers. We will not shut them out, but will give them an opportunity to work alongside of us. Nothing would give me greater pleasure than to teach my employer how to last shoes. But that is only a fad of mine." (309, 310.)

Mr. WYCKOFF believes that "union organization is just as inevitable a part of our industrial organization as the centralization and organization of capital. * * * I should say that it is very much better for the man with a skilled trade—better for him, better for his trade, better for the interests of his class, that he be under conditions which admit of his being a member of the union and adding his personal strength to the strength of the union as such." (193.)

Mr. HARRAH, president of the Midvale Steel Company says that the natural tendency of an employer is to protect his interests regardless of the interests of others. Mr. Harrah had experience in Brazil when it was a slave country, and he found there, what he afterwards confirmed by his experience in this country, that it is most unfortunate that a man should have unlimited power. The power of the steel masters is most beneficially curtailed by the influence of the trade unions. The Midvale Steel Company does not, however, deal with labor organizations in its own works. No inquiry is made whether or not any man belongs to a union. The company makes the wage scale and the men accept it. There has never been any dissatisfaction.

It would be of decided advantage to Mr. Harrah as an employer if wages were made uniform in all competing plants by the action of labor organizations. It would give a certainty and stability to business operations. Whether the actual effect of a labor organization is beneficial or injurious depends upon the character of the leaders of it. (849, 350.)

Bishop POTTER believes that the right of workmen to organize ought to be recognized and distinctly asserted. The organization of labor has in reality lagged behind the organization of capital, and must sooner or later come up to it. It is in the complete organization of labor that the remedy must be found for the pressure which the increased aggregation of capital puts upon the working people. The organization of labor ought to have the help of men of brains and capital who are not laboring men. There is no greater service that men of brains and character can render than that of assisting an intelligent organization of labor. (3, 4, 12.)

Bishop Potter does not think that labor "is as well rewarded voluntarily by anyone as it is likely to be when you get some organization or mechanism which presents the claim of labor in a forcible and intelligent way." He considers that "one of the great services which organized labor renders to those who are associated in it is that it brings before the mind of the employer in a concrete form the justice of its demands." (6.)

Mr. WOODS approves of the progress which has been made in removing the legal restrictions upon associations of workmen and upon the carrying out of trade-union policy. Further legislation in this direction is needed in almost all of our States. In England peaceful picketing in strikes has been allowed by statute for 25 years. In the most of our States there is still difficulty on such points. It is most important that our American economic standards of life be maintained, and the difficulty of maintaining them is great, especially in view of the flood of immigration. On this ground "it is very important that public legislation should give all the encouragement it reasonably can to the peaceful carrying out of trade-union policy." (201, 203.)

Mr. JAMES TANSEY, secretary of the Carders' Association of Fall River, says that it is due in part to the labor organizations that the relations between capital and labor have steadily improved in recent years in Fall River. The organization is educational to the operative. Without organization the operatives are likely to act on impulse, and the formation of organizations has had a great effect in preventing strikes which would otherwise have taken place. In periods of unemployment the organizations are of great benefit to the operatives, as they never allow a case of distress to exist without doing something to relieve it. (579, 580.)

Mr. JOSEPH G. JACKSON, secretary of the Slasher Tenders' Union of Fall River, says that since the formation of unions and the appointment of permanent secretaries there have been fewer labor troubles in Fall River than ever before. Organization has been a benefit to the operatives in other ways. When there is a grievance, it is not necessary for the person aggrieved to make personal complaint and thereby risk his position. All he has to do is to notify the secretary of his department, and the secretary will go to the mill officers. This prevents any blacklisting. The trade-union leaders watch the markets, and are therefore in a position to know when there is a good opportunity for securing an advance in wages. (582.)

Mr. JAMES WHITEHEAD, representative of the Weavers' Progressive Association of Fall River, says that labor organizations tend to keep up wages, and that they also improve the condition of employees, and in many instances prevent impositions that would be practiced on labor except for the organization. (577.)

CXXXII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

Mr. THOMAS O'DONNELL, secretary of the Fall River Mule Spinners' Association, says that one benefit from being organized is that manufacturers recognize the employees and give more consideration to them. Formerly, manufacturers would get together and reduce wages on short notice; now, before a reduction of wages is offered, the matter is considered and discussed by the employees as well as by the manufacturers. Organization also leads to the giving of more careful consideration to points at issue before a strike is resorted to. Organization tends also to keep up wages. Manufacturers will seldom make voluntary advances of wages even when conditions warrant such advances. Individual laborers are afraid to ask for an increase in wages for fear they may be discharged; when an organization, through its representatives, takes up the matter of wages there is no fear of being discharged. Labor organizations have received concessions when unorganized employees could not secure them. When a benefit is of a general character, however, the unorganized employees profit from it also, because it would not be practical to make distinctions. (565, 567, 568.)

Mr. McCORMACK, labor commissioner of Indiana, testifies that in his experience the older and stronger organizations are more conservative and generally settle their disputes by negotiation or arbitration. He thinks that 80 per cent of the labor troubles in Indiana are "with unorganized workmen, or men newly organized, not disciplined or educated along the line of organization." In former years the militia of the State was frequently called out in labor disputes, especially among the railroad men and the miners. These workmen are now strongly organized, and their differences with their employers are usually settled in an orderly way by negotiation. (52.)

Mr. LEO, president of the Builders' League of New York, says that it is more convenient to treat with committees than with large numbers of individuals; and when there is a contest, and the union will agree to abide by the decision, that is the quickest way of getting a solution. (101.)

2. *Evils and abuses generally.*—Mr. FRANK W. CHENEY, treasurer of Cheney Brothers, silk manufacturers, says that, theoretically, labor organizations are all right. The practical results of such organizations are not, however, always desirable. The trouble is that the organizations level down instead of leveling up. The members do not want anyone to earn more than the average rate of wages, and they are often jealous of each other. If one workman is more competent than the others, and does more work, the others are apt to make it uncomfortable for him. (783, 784.)

Mr. LEO says that much of the trouble in dealing with labor organizations comes from the fact that they are really governed by a small minority. If a union has 600 or 800 men, there will be only 30 or 40 that will attend the meetings. The rest simply do what the union dictates. Places are always provided for the faithful 30 or 40, because they elect the officers and the business agents. Many of the best workmen are in the silent majority. (98.)

Mr. HARDING, a building contractor, says that less than 10 years ago the great majority of the doors, sashes, blinds, and trim of all kinds in the carpenter line used in New York City were manufactured within the limits of what is now called Greater New York. To-day he believes that not 30 per cent of it is manufactured there. He attributes the change to the high cost of labor in New York, due to the high wages and the short hours enforced by the unions. He has in mind two instances of large trim factories which moved from New York City, in each case in consequence of a strike. (109.)

Mr. DIMOCK, president of the Nonotuck Silk Company, says that there is no question but that workingmen have a right to organize for their own protection. There is a question, however, as to whether organization is a benefit to them. If trade unions could be induced or compelled to ascertain the feeling of their members in respect to the advisability of a strike by secret ballot, it would be a very desirable thing. Frequently strikes are ordered because the members opposed do not dare, for fear of social ostracism, to vote against them. So far as nonunion labor is concerned, the nonunion workingman ought to be free to make contracts without having to depend upon the permission of the labor organizations. (694, 695, 696.)

3. *Effect on wages.*—Mr. CRESSON, a manufacturer of transmission machinery, thinks that wages have probably increased in places where the trade unions have been most active; "but they will find their level again, because it is only a question of how much a man can pay to manufacture a thing." (271.)

Mr. LEO states that while unions regularly fix a minimum rate of wages, they are generally willing to allow their members to get as much as possible. The pattern-makers' organization in New York will not permit a man to get more than the standard rate. He does not know of any other such instance. (100.)

B. Officers and leaders of unions.—1. *Necessity for business agents.*—Bishop PORTER considers business agents to be a necessary medium for the dealing of workmen with their employers. He quotes with approval the statement of a business agent to an employer: "I have always noted this fact, that whenever a body of employees appointed a body of 3 men or 2 men or 1 man to go to the employer and represent what they thought would be fair as to wages, whether or no the demand was conceded, that particular workman or these particular workmen, sooner or later disappeared out of this gentleman's employ." (4.)

2. *Powers and methods of business agents.*—Mr. LEO complains that business agents call off their men on strikes, sometimes without so much as giving a reason to the employers or to the men. When the men go out the employer has to hunt up the agent and inquire what the trouble is. It is true that the authority of the business agent is limited by the constitution of the union, but he does not think that the existing system is better than the methods that existed before organizations were so highly developed. The great trouble is that by reason of the association of the unions, one walking delegate "has the other unions as a club."

The business agents are very arbitrary, not only in the treatment of employers but in their treatment of their own men. If a man has been out of work and has not been able to keep up his dues to the union, the walking delegate will demand his card, and, on finding that it is not paid up, will order him off the job. This will be done even though the man explains the circumstances and promises to pay up as soon as he gets his week's wages. So, simply because a man is unfortunate, he is shut off from his means of livelihood and from the possibility of paying what he owes. (97-99.)

Mr. LEO, president of the Builders' League, New York, says that the league undertook to have stewards appointed as representatives of the workmen in different trades, who should be old and experienced journeyman, but should be appointed by the employers. This effort was a failure because the plan was not satisfactory to the unions. It interfered with the work of the walking delegates, who are the authorized representatives of the unions. (96.)

Mr. STEINBOSS, general secretary-treasurer of the National Building Trades Council, denies that business agents interfere with the business of employers, or stir up difficulties, except in isolated cases. Such charges are trumped up by employers when disputes arise. The duty of the business agent is to collect dues, to see that the men have their cards, to bring non union men into the organizations, and in case of trouble to adjust it, if possible, by peaceful means. The business agent has the same sort of value to the union which the manager has to a business concern. (23.)

3. *Salaries of business agents.*—Mr. WILLIAM J. O'BRIEN, of the Granite Cutters' National Union, says that labor delegates are, as a general rule, paid their regular rate of wages, with, perhaps, an additional amount of 50 cents or a dollar a day. (424.)

C. Methods of unions.—1. *Care of members.*—Professor COMMONS states that "it has been shown in London and in this country that at times of depression practically no union man has applied for relief from the public authorities. He is cared for one way or another by his union." (39.)

Mr. HOURWICH testifies that during the industrial crisis of 1893, when he examined the data with regard to many thousands of unemployed workmen in the city of Chicago, he found very few members of labor organizations among the applicants for charitable relief. Whether this was because there was less unemployment among organized workers, or because they were better paid and could stand unemployment longer, or because they were aided by their organizations, he does not pretend to say. (167.)

2. *Maintenance of strike funds.*—Mr. FOX, president of the Iron Molders' Union, says that his union sets apart 58 per cent of its receipts for a defense fund, to be used for the benefit of members on strike. It usually takes care of striking members even after the strike is over, if they can not get work. "For instance, it supported the strikers at San Francisco for 20 months, and others at Indianapolis for 24 months, though the strike was practically lost much sooner." (148.)

3. *Places of meeting.*—Mr. REYNOLDS states that the Central Federated Union of New York and four other labor organizations hold their regular meetings in the buildings of the University Settlement. Before they came there all of them met in rooms connected with saloons. Mr. Reynolds has been repeatedly assured that such organizations can hardly find in New York any hall at a rent which they can afford to pay which is not attached to a saloon. Halls connected with saloons are rented cheaply, but the members of the society are frequently reminded of the low rent, and they are made to feel under obligation to patronize the bar.

CCXXXIV INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

Sometimes it is made impossible for them to reach the meeting place without passing directly by the bar. As a result, the leaders say that some of the members are likely to reach the meeting in a condition which scarcely permits the serious and orderly consideration of business. (80.)

D. Relations of union and nonunion labor.—1. *Demand for exclusive employment of union workmen.*—Mr. HOURWICH justifies the demands of the labor organizations for the exclusion of nonunion men from employment. He asserts that this demand is identical with restrictions often inserted in other kinds of contracts. If a railway company bids for the transportation of troops it is natural for it to stipulate that it shall have the exclusive privilege of transportation between the points named in the contract. If a labor organization makes a contract of employment it must insist upon a similar provision, lest its contract become inoperative. The employer may lay off at any time such hands as have become superfluous to him. If he had the further privilege of subsequently replacing them with outsiders, not bound by the terms of the union's contract, he could practically rescind his contract with the union without openly saying so.

"No less important is the injury to the discipline of the organized body, which must inevitably result from suffering a number of outsiders, not subject to the jurisdiction of that body, to work side by side with the members of the union. A union of workmen will avail itself primarily of the same remedies as a single hired man to enforce the terms of its hiring. In case of a breach of contract on the part of the employer, the individual employee may quit; if he is reasonably certain that he is wanted by his employer he may thus succeed in obtaining redress. But when one-half of the force of a factory do not belong to the union, what will it avail the other half to quit, under similar circumstances, if the outsiders will remain at work? Whoever has had any experience on the labor side of this matter is forced to the conclusion that a union can sooner concede a reduction in the rate of wages than waive this fundamental demand."

The Appellate Division of the New York Supreme Court has lately made a new departure in adopting the view of the British House of Lords, which has unqualifiedly recognized the right of a labor union to refuse to work with nonunion men and to demand the discharge of nonunion men where union members are employed. This view is at variance with New York precedents, and it remains to be seen whether it will be upheld by the Court of Appeals. (154.)

Mr. STEINBISS, general secretary-treasurer of the National Building Trades Council, quotes a request which his organization has presented to the public, that only men in possession of the building-trades-council working card be employed in the construction of buildings. As reasons for compliance with this request the organization suggests, first, the delay in construction which may be caused by the refusal of union men to work with nonunion men, and, second, "the risk of having your building erected by reckless irresponsible parties, who loist themselves upon the community with bad material and inferior work, executed generally by unreliable tramps or boys at cheap wages, frequently the cause of accidents and faulty construction of buildings." To make it easy to secure union work the organ of the National Building Trades Council publishes every week a list of contractors who employ none but union men. (16.)

Mr. CROXTON, president of the Boot and Shoe Manufacturers' Association of Philadelphia, asserts that he knew a case, when the Knights of Labor controlled the Philadelphia shoe manufacture, in which a manufacturer wished to have his own son work for him, and was not permitted because the son was not a Knight. He made application to become a Knight and was blackballed. (332.)

2. *Attitude of nonunion men toward unions.*—Mr. FRANKLIN ALLEN, secretary of the Silk Association of America, says that there can be no question as to the right of labor to organize, so far as the men that unite are concerned, but the men that do not go into the unions must have freedom to work assured to them. To nonunion workmen "unionized labor" means the arbitrary restriction of the natural labor market, and this restriction and the claims made by union labor the nonunion workmen feel bound to resist. (681.)

Mr. STEINBISS believes that there are at least a million and a half of organized workers in the country, and says that the majority of unorganized workmen are disposed to comply with the requests of organized labor to stay away when there is a strike. They feel it to be dishonorable to take the place of strikers, and they also feel that employment obtained in that way is not likely to be continuous. There is no employer in the building line but prefers union men. The witness has known contractors who would not employ nonunion men under any circumstances. (23.)

3. *Labor organizations as monopolies.*—Mr. HOURWICH declares that labor

unions are organizations in restraint of trade, and that when they have sufficient strength they maintain monopolies. They are not monopolies with reference to individual workmen, if any workman of good character is permitted to join, but they are monopolies with reference to the employer. Suppose an employer needs 1,000 men. He can get 250 men outside the union, but he can not get 1,000. The 750 who belong to the union say that they are willing to work on the terms offered, but are not willing to work with the other 250 men who do not belong to the organization. The employer has the alternative of taking the 250 or the 750. He will take the 750 and turn off the others. The 250, finding that they can not get a job otherwise, will join the union. The union can not make such a demand if it has only 5 or 10 per cent of the workmen: but from a common-law standpoint an organization which intends to combine all the men in a certain trade so as to make joint contracts and to do away with individual bargaining is an intended restraint of trade. The restraint of trade becomes actual when the union acquires a certain strength in the trade and begins to make use of its monopoly power. The essential feature of a monopoly is in its effect upon the consumer. The object of the union is to control the trade so that consumers can not buy the commodity of the union—labor—except from it. This intention is the intention to create a monopoly. Mr. Hourwich believes that such a monopoly is desirable, both for the employer and for the employee, but it is a monopoly, and it should be regulated. When this labor monopoly joins with a combination of capital there is a combined monopoly as against the consumer, and the State ought to come in to take care of the consumer.

The monopoly of the trade union is not directed against the individual workman outside. So far as they are concerned, the remedy for any hardship is simply in joining the organization. (147, 154, 160, 161, 168.)

E. Attitude of employers toward unions.—Mr. McCORMACK, labor commissioner of Indiana, finds the opinion of employers growing more and more favorable to labor organization. He cites the case of a mine owner who formerly had nonunion men, and was not willing to arbitrate his disputes with them or to deal with a labor organization. Experience has entirely changed his opinion. He now says that he intends to work union men as long as he stays in business, because he can meet his men on the 1st of April each year, arrange the wage scale and the working conditions, and be free for the rest of the year to give his attention to disposing of his product. (59, 60.)

Mr. NELSON, president of the N. O. Nelson Manufacturing Company, says that the employees of his company in each line of work have their union, by the desire and encouragement of the management. (358.)

Mr. FREEL, a woolen manufacturer, has no positive objections to labor organizations as such, but he objects to their methods. "I am very much in favor of labor organizations for the purpose of elevating the character of the work people. I think if that was their purpose more than the arbitrary one of taking advantage of the position of their employer, they would be eventually much better off." (243, 244.)

Mr. LEAKE, a Philadelphia manufacturer of cotton and linen fabrics, has no objections to labor organizations "so long as they keep within legitimate bounds." He has had very little labor trouble: he has always settled his differences with his employees on lines that were conceded by both sides to be equitable. Although Philadelphia was the headquarters of the Knights of Labor "during the acute stage of that disease," Philadelphia perhaps suffered less from it than some other portions of the country, because of the somewhat paternal relation of employers there to their work people. "Most disputes were settled in the family way, but where they could not be settled in that way we took the strong hand." (278, 281.)

Mr. O'BRIEN, of the Granite Cutters' National Union, says that there is a better understanding between employers generally and labor organizations than was formerly the case. Employers have at last reached the conclusion that to get practical workmen they must employ members of trade unions, and they realize that if they employ nonunion workmen, those workmen will soon become educated and demand just as good conditions as demanded by anyone else. (431.)

Mr. FOX, president of the Iron Molders' Union, says that it is only the corporations which the molders come in contact with that give them any trouble with regard to the recognition of the union. Even with them he is usually able to come to satisfactory terms, and the tendency to recognize organized labor is increasing. (149.)

F. Union labels.—Mrs. SYMONDS, labor editor of the Philadelphia Inquirer, says that the union label of the cigarmakers has largely done away with the evils of sweat-shop work in that trade. Any union label, like that of the Garment Workers, is supposed to mean that the goods on which it is put are made under

fair conditions, and it does mean it if the union is honest. The State of Pennsylvania protects such labels by law, and there are several men in the State who are serving terms in jail, or have paid heavy fines, for counterfeiting them. (264.)

G. Incorporation of trade unions.—1. *Incorporation advocated.*—Mr. LEAKE thinks that when there is a test of strength between the labor organization and the employers the union is likely to promise to do some things which it can not fulfill. The failure to keep agreements is probably not from unwillingness on the part of the leaders. The employees who fail in their obligations are likely to be disciplined, but the union is often unable to deliver the goods. The employer is at a disadvantage in dealing with people who have no direct pecuniary interest in the issue, and who have no pecuniary standing to guarantee him against damage by failure of contract. Mr. Leake thinks that one of the most helpful changes that could be made in the law, from the laborer's standpoint, would be a provision that labor organizations should be incorporated, have capital, and have power to sue and to be sued. Then the employers would feel that they were dealing with responsible bodies, and in the event of any breach of contract there would be redress. (278, 279.)

2. *Powers and duties of incorporated unions.*—Mr. HOURWICH points out that labor organizations are incapable under the existing law of enforcing in court contracts relating to the wages and other conditions of employment of their members. If such a contract is violated the individual workman may be damaged, and each one might be able to collect damages by a separate suit; but the union, if it is a corporation, is regarded by the law as an entity distinct from its members, and since as an entity it would have made no profit by the carrying out of its contract, it can show no damage by the breach of it. Mr. Hourwich argues that there should be a special law for the incorporation of trade unions, allowing them to make labor contracts on behalf of their members, and, if the contracts are broken, to collect the damages which the members suffer as a society or as individuals.

Mr. Hourwich holds that if a labor organization breaks a contract it should be held in pecuniary damages just as an employer should be. The unions generally have funds which would make them quite as responsible in a financial way as many employers are. If a union had no funds that could be reached the case would not be different from that of the many judgments against individuals and business corporations that are every day returned unsatisfied. He would not say that the property of the members of the organization should be taken; but if a union is given the privilege of suing for damages when an employer breaks a contract with it, it could not reasonably be exempted from liability if it broke the contract. It should find safety in keeping its contracts. (143, 152, 155, 157.)

Mr. Hourwich calls attention to the law of New York regarding cooperative corporations consisting of members who are supposed to combine both their capital and their labor for the attainment of a common purpose. Such companies were provided for by a law of 1867 and by amendments of 1878. When the commission appointed in 1891 revised and unified the corporation laws of the State it divided all corporations into three classes—stock corporations, nonstock corporations, and mixed corporations. Stock corporations are business companies, and nonstock corporations were intended to include membership corporations, or social clubs of all kinds, and religious corporations. The class of mixed corporations was meant to include companies which partake of the qualities of both classes. Among these were the cooperative corporations. But the commission finally prepared no general law for mixed corporations. Some of them were included under the membership corporations as special branches. The name of cooperative corporations was retained in the law, but absolutely no provision was made as to their powers or duties, and the old law relating to them was repealed. Mr. Hourwich, having occasion to incorporate certain labor organizations, incorporated them as cooperative companies; but the question of the powers of such companies is left entirely open to be determined by adjudication of the courts. (157, 158.)

Mr. Hourwich says that an unincorporated labor organization in New York may make contracts and incur civil liability, and may bring civil suit, for instance, against a defaulting treasurer, just as any other private firm might. A labor union, incorporated as a membership corporation, in New York, might make any contracts which are necessary to the furtherance of its purposes. It might buy real estate, and if it owned real estate it might rent a portion of it to other parties. Even if unincorporated it might acquire title as a partnership. It need not necessarily acquire the title through trustees. That would depend upon its own rules and regulations. (159, 160.)

Mr. Hourwich believes that the opposition of many trade unions to incorporations comes from lack of familiarity with the advantages which could be derived

from the protection of the law. Some of it arises also from the experience of the labor organizations with the law. The law has in most cases favored the employers' side; at least that is the contention of the union. (160.)

3. *Registration of trade unions in Great Britain.*—Mr. WILLOUGHBY says that as he understands it the chief privilege which the British trade unions obtain by registration under the law is the right to hold property through trustees, and to sue in their name and to hold them to account. Under the old system it often happened that a union had no redress against a dishonest treasurer or other officer. Under the registration law it is entitled to that redress. The conditions of registry are that they shall make certain reports and do some things which do not appreciably limit their real freedom. (175, 176.)

H. *Miscellaneous evidence.*—1. *Industrial combinations and labor organizations.*—Mr. Brooks says that the new industrial combinations have a powerful motive to get rid of the trade unions, or to cripple them, by making them sign a contract that they will not have anything to do with the application of new inventions. This, in Mr. Brooks's opinion, is the most ingenious way of weakening the trade union. The better unions do not oppose machinery. They know its advantages as well as the employer. But the manner in which the machinery is introduced is of vital concern to them. The new invention often alters the wage scale and often drops out a few of a given group. If the introduction of machinery goes on without being influenced in its methods by the unions, the unions can not secure their share of advantage from the new invention. This is what has happened with the lasting machine and other machines in the shoe trade. They have weakened one of the most powerful unions in New England. But to discuss the introduction of machinery with union committees causes delay which is felt as burdensome by the manufacturers. Our manufacturers know that they get an economic advantage over the English by being able to apply machinery as fast as it is invented without any such discussion. English iron masters and engineers know that the Carnegie Company competes against England far more effectively and dangerously because no union committee has a word to say on the question of new machinery in its works. But if the manufacturer can introduce machinery without consulting the union as to conditions, he gets such an advantage that in many industries he can completely cripple the labor organization. This is what the great new combinations will desire to do. Mr. Brooks has recently been told by a man who has organized two of the most successful trusts in the United States that he and his associates have no fear of the trade union. Their strikes can be beaten, and have been beaten, through the advantages of the great organization with its independent and widely separated plants. (139-141.)

2. *Labor organizations in the South.*—Mr. THOMAS O'DONNELL, secretary of the Fall River Mule Spinners' Association, says that the operatives in the Southern mills are organizing very rapidly. Where there were only hundreds belonging to labor organizations 2 or 3 years ago there are thousands to-day, and the number will continue to grow. The manufacturers have tried to prevent the organizing of labor, but the laborers themselves are in favor of it. (570.)

3. *Labor organizations and socialism.*—Mr. BROOKS declares that the growth of socialism in such New England towns as Brockton and Haverhill is the result of the feeling of the workingmen that their trade organizations can effect nothing. If employers want to make socialists in this country they have only to "smash the unions." When the men feel that they are helpless, that their organization is helpless, they turn to the municipality and the State. They become socialists. (140-142.)

4. *Workingmen's Federation of the State of New York.*—Mr. O'BRIEN, of the Granite Cutters' National Union, says that the Workingmen's Federation of the State of New York is an organization representing labor organizations throughout the entire State. It has an executive board which looks after the interests of labor before the legislature. The Federation takes up nothing but measures of a general nature. (435.)

5. *Iron Molders' Union.*—Mr. FOX, president of the Iron Molders' Union of North America, states that this organization was formed on July 5, 1839. It now includes about 65 per cent of the iron molders of the United States and about 75 per cent of those engaged in stove manufacture. Its initiation fee is \$5, and each member pays 25 cents a week as dues. Forty per cent of the dues goes to pay the running expenses of the national organization, including strike benefits of \$7 a week, a death or disability benefit of \$100 or \$200, according to the length of membership, and a sick benefit of \$5 a week for not more than 12 weeks in any one year. (143, 144.)

CXXXVIII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

VII. LABOR DISPUTES AND DIFFICULTIES.

A. Strikes.—1. *Causes of strikes.*—Mr. Fox, president of the Iron Molders' Union of North America, says that in the foundry industry the most prolific causes of strikes are the questions of wages and the discharge of men for belonging to the union. (143.)

Mr. RINEY, labor commissioner of Missouri, mentions among causes of particular strikes an attempt to increase the daily task without increase of wages, and an attempt to have boys taught work that had been done by men, so crowding out men and lowering wages. (72.)

Mr. DIMOCK, president of the Nonotuck Silk Company, says that as a rule some inefficient, ignorant ringleader is responsible for strikes. (694.)

Mr. JAMES WHITEHEAD, representative of the Weavers' Progressive Association of Fall River, says that the majority of strikes are caused by disputes over the rate of wages which should be paid. Sometimes strikes occur because of tyrannical acts on the part of overseers or corporations. (574.)

Mr. THOMAS O'DONNELL, secretary of the Fall River Mule Spinners' Association, says that the furnishing of poor material to the spinners has caused strikes among cotton-mill operatives at times. The principal cause for strikes, however, is the wage question. (505.)

Mr. J. WEIDMANN, of the Silk Dyeing Company of Paterson, N. J., says that in many cases strikes are caused by the refusal of employers to meet with committees appointed by the operatives. There ought to be in the silk industry a regular system of conference between manufacturers and operatives; but there is great difficulty in the way of establishing such a system, because not only the silk operatives but the manufacturers themselves are of many different nationalities. (706.)

Mr. CROXTON, president of the Boot and Shoe Manufacturers' Association of Philadelphia, asserts that a Philadelphia firm which pays the highest wages in the United States, so high that when the rate was reported to the State government, the government would not accept it until it had investigated the books for itself, has "more strikes than anybody else." (331, 332.)

2. *Results of strikes.*—Mr. Fox, while admitting that strikes in their immediate results are unprofitable to the community, to the employers, and to the strikers, declares that without the ability and the will to offer organized resistance to what the workmen deem unjust demands there would be nothing between them and a condition worse than slavery. In the long run strikes have saved to the workers, both organized and unorganized, a more equitable share of the wealth they produce; yet the necessity of them is to be deplored, and it is a discredit to our intelligence and civilization that a better means of adjusting differences has not been found. (144.)

Mr. O'DONNELL says that while strikes are a great injury both to employer and employee, and also to the community at large, they are a necessary evil; and that, although losses result at the time, good results accrue afterwards both to employer and employee, even when the object struck for is not obtained. More careful consideration is given to the questions at issue before a strike is entered into again. (565.)

Mr. STEINBISS quotes an utterance of his made in 1894, in which he said that "experience has demonstrated and taught us that strikes are failures." He now believes, however, that "strikes have been successful in accomplishing the end that we aim at, in lieu of anything better." He therefore disapproves his statement of 1894. (14.)

3. *Causes of failure of strikes.*—Mr. STEINBISS mentions several cases in which local building trades councils have failed in the conduct of disputes with their employers. In Kansas City he attributes the failure to the introduction of party politics. In Memphis and Savannah he believes that the demands were made too soon after the organizations were formed, and before the members were "fully drilled in the mysteries of unionism, so as to be able to undertake a strike." (15, 23.)

4. *Necessity of strikes.*—Though Bishop POTTER regards the strike as a reversion to barbarism, he considers that under present conditions it is a necessary weapon of the workman. It is necessary as war is necessary. The employers are likely to contend against increase of wages or shortening of hours until they realize that the employees have force enough to meet them in a contest. (11.)

5. *Methods of inaugurating strikes.*—Mr. Fox quotes the rules of the Iron Molders' Union as to the inauguration of strikes. When a difficulty occurs with an employer the local union must hold a meeting and vote by secret ballot on the question of insisting on its demands. A three-fourths vote is required. If this vote is given, the national president must be notified, and he must come to the place, in person or by deputy, to try, together with the local committee, to settle the dispute. If he does not succeed, he notifies the national executive board. A strike can not be

DIGEST:—LABOR DISPUTES AND DIFFICULTIES. CXXXIX

declared until this board gives its permission. Throughout the negotiations the local union is required to keep at work. If it strikes after being notified that its grievance is not sanctioned by the executive board, the president and the board have power to suspend it from the national union. (143.)

Mr. STEINBISS says that by the constitution of the St. Louis Building Trades' Council no strike can be declared on any building unless two-thirds of the trades interested are in favor of it. (28.)

6. *Legal rights of employers and employees in strikes.*—Mr. HOURWICH says that "it can not be said that the right of workmen to refuse, by concerted action, to work for an employer if the terms do not suit them has received unqualified recognition. The common law regards every strike as a conspiracy. The New York statute exempts from this inhibition a strike for the purpose of obtaining an advance in wages or for opposing a reduction of wages. But as this statute creates an exception from the common law, it will, under the familiar rule, be construed strictly. Anything not expressly contained in it is still governed by common-law principles. Now, a strike is not always the result of differences as to the rate of wages." A strike is of course an injury to the employer's business, and a threat to strike is a threat to injure him; but injury may be committed without any legal wrong or liability. The putting up of a building on one's own lot may shut off light from a neighbor's house and inflict an injury on him, but it is a lawful act and creates no liability for damages. Yet Mr. Hourwich has had the experience of hearing a defense based on threats "to injure the defendant's business," without specifying any unlawful act, held a sufficient defense by the New York supreme court. (154.)

7. *Suppression of lawlessness.*—Mr. RIXEY says that in the great St. Louis street-car strike of 1900 the governor steadily refused to call out the State troops to suppress lawlessness, although he was urged to do so. Mr. Rixey does not believe that lawlessness could have been suppressed while the feeling was at its height, even if all the 2,400 men of the State guard had been called out. Mr. Rixey advised against calling out the militia. While it is the duty of the State to protect life and property, it is the duty of the executive authorities to choose the means by which protection can best be given, and Mr. Rixey considers that the use of the militia should be the very last resort after everything else has failed. (67-69.)

8. *Sympathetic strikes.*—Mr. FOX says that sympathetic strikes are, as a rule, the result of the quick sympathies of workmen for one another when attacked by the employing interests. They are declared impulsively and often without proper investigation. As a result they are often disastrous, and they should be discouraged. The employing interests are combining so generally in the form of associations that it may be necessary for unions of allied trades to combine in order to be better able to resist organizations of employers, but strikes of allied trades that might result from this higher organization would not be properly sympathetic strikes. They would "be the result of the careful consideration and calm judgment of some tribunal representing the several trades, and competent to arrive at an intelligent decision upon the points involved." (143, 144.)

Mr. STEINBISS considers that sympathetic strikes are necessary and will never be done away with, because they are the foundation principle of the Building Trades Council. It is temporarily unfortunate that 30 or 40 unions should cease work because of a dispute of one, and perhaps a little one; but through this very strengthening of organization a change of conditions will ultimately be brought about which will do away with strikes. To leave each trade to settle its troubles by itself is against the policy and principles of trade unionism. Many trades are small and weak and subject to oppression by their employers. As a matter of humanity the strong trades ought to go to their assistance. The sympathetic strike may well extend sometimes even beyond the bounds of affiliated trades, as in the case of "the miners or men that are underpaid and working under conditions bordering on slavery." (20, 21, 27, 28.)

Mr. O'BRIEN, of the Granite Cutters' National Union, says that a sympathetic strike is certainly a hardship, and that the organization to which he belongs has tried in various ways to avoid such strikes. Some of the employers, however, have a tendency to attack a weaker organization, and it is absolutely necessary in such case for the stronger organizations to come to the rescue. (424.)

Mr. LEO, president of the Builders' League, says that the great trouble in the building trades of New York has been the sympathetic strike. He recalls one instance, but one only, in which the employers have resorted to a sympathetic lockout. He does not defend this action, except as a case of fighting fire with fire. "The value of the weapon is undoubted; the fairness of the weapon we question very greatly." (97.)

9. *English law in respect to strikes.*—Mr. STEEL believes that the English law

CXL INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

requires workmen to give two weeks' notice before going on strike, and forbids workmen to leave material in process and subject to deterioration. On the other hand, the manufacturer is required to give notice of discharge to his workmen. The parties are placed on the same level. (244.)

10. *St. Louis street-car strike.*—Mr. RIXEY gives a detailed account of the great street-car strike in St. Louis in the summer of 1900. He says that the strike began on May 7. Demands were made upon the St. Louis Transit Company, which was a consolidation of the most of the lines in the city, for shorter hours of labor, and also for the exclusive employment of members of the Amalgamated Association of Street Car Employees of America. There was also a strike on the lines of the St. Louis and Suburban Street Car Company, which controlled a small part of the lines of the city. This was settled without serious trouble. On the lines of the St. Louis Transit Company, however, amounting to some 400 miles, not a car was run for 12 days from May 7. When the cars did begin to run there was such violence and terrorism that people were afraid to ride in them. There was hardly a day or an hour in the day that some bodily harm was not done. About 14 persons were killed and about 150 to 175 were injured. Additional policemen were sworn in, and the sheriff swore in some 1,500 deputies. For nearly two months thousands of people would not ride upon the cars of the Transit Company, but walked or rode in wagons. Some were actuated by sympathy with the street-car employees and some by fear of violence.

The Transit Company said that its loss was about \$1,250,000. It was estimated that the employees lost about \$275,000 in wages, and that the public at large lost over \$30,000,000. The whole business of the city was greatly injured. People would not come to the city to buy goods, either at wholesale or at retail. Traffic on the railroads running into St. Louis was smaller than it had been for years. Mr. Rixey adds that the heads of the street-railway employees' union did everything that they could, through the press and in all ways, so far as he knows, to repress violence and lawlessness. He believes that the great majority of those who were engaged in the lawlessness were boys and young men who went into it as a matter of sport.

The governor of the State came to the city repeatedly and made every effort in his power to settle the trouble; so did the attorney-general. A committee of seven of the leading business men of the city was formed to effect a settlement. The committee met almost daily, sometimes twice a day, for 3 weeks. There was no trouble in approaching the representatives of the employees or of the road, or in bringing them together in conference, but it was absolutely impossible to get them to agree. The point of difference was that of the recognition of the union and the exclusive employment of union men. All the other demands were settled easily enough. Mr. Rixey undertook to form a board of arbitration under the law, and asked each party to suggest two men to be members of it. The employees complied, but the Transit Company refused, saying that there was nothing to arbitrate, and that the law did not require it to comply with such a request.

On July 2 an agreement was made between the president of the Transit Company and the chairman of the committee of the employees providing that the strike should be declared off: that no discriminations should be made by the company for or against any employee because of his joining or not joining the union; that any employee who should try to induce any other employee, by intimidation or threats, to join or not to join the union, and any official who should attempt to influence any employee to join or not to join the union, should be discharged. A list was to be made of the men in the company's service at the beginning of the strike, and as additional men were needed they were to be selected exclusively from this list until it was exhausted. Men employed during the strike were not, however, to be interfered with, and no person should be eligible for employment who had been guilty of any lawlessness or violence.

This agreement was repudiated by the union, and the strike has never been declared off. The union said that the committee which made the agreement had no power to make it, except subject to confirmation by the union. The result has been that the strike has been lost. (62-66.)

B. Injunctions in strikes.—Mr. FOX, admitting the value of injunctions for their legitimate purposes, believes that the use that has been made of them in labor troubles since 1894 is contrary to their original intent, "subversive of the rights of the citizen, and has done much to create a feeling of disrespect and distrust toward the courts among a very considerable portion of the community, to the distinct injury of its morality and patriotism." It infringes upon the liberties of the citizen, and gives rise to the suspicion that temporary injunctions are applied for solely to break the strike by completely tying the hands of the strikers. Limitations should be put upon the use of the injunction, and persons accused of contempt of injunctions issued in such cases should be given jury trial. Trade

DIGEST:—ARBITRATION, CONCILIATION, AND AGREEMENTS. CXLII

unions do not countenance violations of law, but the law itself provides adequate penalties. (146.)

Mr. JAMES WHITEHEAD, representative of the Weavers' Progressive Association of Fall River, says that he does not believe that anybody ought to be arrested and tried in injunction proceedings. If a man wants a jury he ought to have it. (575.)

C. Boycotts.—Mr. STEINBISS believes that the boycott is a proper weapon of the workingmen, but does "not believe in carrying it out to an extent where innocent parties are injured." (27.)

Mr. HARDING, a building contractor, declares that during a strike in 1899 some of his men showed him a list of manufacturers who had been blacklisted because, though they were compelled to yield to the demands of the unions, they had opposed them and had undertaken to fight. He understands that those names are still posted in the rooms of the union as the names of persons who are to be set upon as soon as there is opportunity. (107.)

VIII. ARBITRATION, CONCILIATION, AND JOINT AGREEMENTS.

A. State laws relating to arbitration.—1. *Indiana.*—Mr. McCORMACK says that the Indiana Labor Commission, or Board of Conciliation and Arbitration, was established by a law of 1897. It consists of two commissioners, appointed by the governor for terms of four years. Both commissioners must have been connected for not less than 10 years with departments of industry in which it is usual to employ a number of persons under single direction and control. One must have been, during the 10 years, and must be at the time of his appointment, connected with the labor interest, and the other with the capitalist or employing interest. The two commissioners must not be members of the same political party. They must be not less than 40 years of age, and neither may hold any other office during the time for which he is appointed.

When the commission is informed of the existence of a strike, lockout, boycott, or other labor trouble within the State, its duty is to go to the place where the trouble exists and offer mediation. If this is refused, or fails, the commission must offer arbitration, either by the State board or by any other method that may be agreed upon. The labor commission and the judge of the circuit court in the county in which the trouble exists may act as a State board of arbitration. Two other members, one named by the employer and one named by the employees, may be added if desired. The agreement to enter into arbitration must be in writing, and must state the issue to be decided. It has the effect of an agreement by the parties to abide by the award. Employees who are members of a labor organization may be represented by its officers in the execution of such arbitration agreement. If any party to the arbitration is charged with failure to comply with the award, the circuit court may grant a rule against the party so charged to show cause within 5 days why the award has not been obeyed. The judge has power to hear and determine the questions presented, and to make such order as shall give just effect to the award. Disobedience may be punished as contempt of court.

Any employer and his employees, between whom differences exist which have not resulted in a strike, may apply to the labor commission, as such, for arbitration, and the board of arbitration shall be organized and the award rendered and enforced in the same manner as under the provisions just stated.

This law gives not compulsory arbitration, but compulsory obedience to the decision of the board of arbitration. At any time before the decision is rendered the application for arbitration may be withdrawn, but not after the decision is rendered and made a matter of court record. It has never been necessary to apply the compulsory provisions of the law. There have been cases in which the decisions of the board have been made a matter of court record, but the decisions have always been obeyed strictly and fairly. The decisions are usually made for one year. (49, 50, 53, 54.)

2. *Missouri.*—Mr. RIXEY, commissioner of labor statistics of Missouri, quotes the sections of the statutes of his State relating to State boards of arbitration. It is made the duty of the commissioner of labor statistics, when he is informed that a dispute has arisen between an employer and his employees which may result in a strike or a lockout, to visit the place and try to mediate between the parties if he thinks it necessary. If mediation can not be effected, the commissioner may direct the formation of a board of arbitration, consisting of two employers and two employees engaged in a similar occupation to that in which the dispute exists, but not parties to the dispute, together with the commissioner of labor statistics himself, who is the president of the board. The board has power to examine and hear the matter in dispute, and is directed to render a decision within 8 days after the investigation. The decision is to be published, and a copy is to be

furnished to each party in the dispute. The law distinctly provides that the only effect of the investigation shall be to give the facts to the public through an unbiased channel. Such a board of arbitration may not be formed when work has been discontinued. (62.)

3. *Ohio*.—Mr. McCORMACK testifies that he has been given to understand by the secretary of the State board of arbitration of Ohio that a bill is about to be introduced in the legislature of that State providing that "whenever, in the unanimous judgment of the State board, a strike or lockout is not within reach of present adjustment and seriously menaces the public peace or endangers life or property, or if the situation caused by such strike or lockout be such, in the opinion of the governor, as to justify the calling out of the militia or a part thereof, or if the same has been called out because of such strike or lockout," the board, after notice and hearing, may enter on its minutes a recommendation to the parties that the strike or lockout be suspended for a given number of days pending adjustment or arbitration. When the parties have been served with a notice of this action they must comply. If they fail to comply complaint may be made to the court of common pleas of the county, and after notice and hearing the court or the judge may make an order for the carrying out of the recommendations of the board, with such modification, if any, as may appear just and proper; and disobedience to such order may be punished as contempt of court. Mr. McCormack approves the provisions of this bill. (51.)

4. *Europe*.—Mr. WILLOUGHBY says that the most of the legislation in Europe relating to arbitration is on the same general lines as the arbitration laws of this country. It provides for voluntary arbitration boards. This is the character of the councils of prud'hommes in France. These courts are frequently able to do away with little disputes and causes of friction such as often cause strikes in this country; yet in France as well as here the parties often prefer to organize arbitration boards of their own. (175, 179.)

B. Working of State boards.—1. *General discussion*.—Mr. FOX, president of the Iron Molders' Union, has found State boards of conciliation and arbitration of little value. They do not possess the full confidence of employers and employees. They can not be acquainted with all the various interests that demand their attention and can not always be competent to give an intelligent decision without the help of experts. (146.)

Mr. LEO, president of the Builders' League of New York, while believing in arbitration, does not believe that State boards are likely to be of great value. The State board of New York has worked hard, but its efforts have been regarded with suspicion on both sides. The party against whom it decides feels that it does not understand the question. The proper way to settle disputes is by arbitration within the trade, arranged between employer and employee. (97, 98, 101.)

Mr. McCORMACK says that the investigation by a State board of the causes of a labor dispute, with publication of the findings, would be of value in throwing the weight of public opinion on the right side of the controversy. Public opinion is perhaps the most powerful factor in such cases. The Indiana law, however, does not permit the board to publish its findings. (60.)

2. *Indiana*.—Mr. McCORMACK thinks that the Indiana board of conciliation and arbitration is of great value to the State, but says that its chief efficiency is among the unorganized and the newly organized workmen. Its work in settling labor disputes is done less by arbitration than by mediation. (52, 53.)

2. *Massachusetts*.—Mr. WHITEHEAD, representative of the Weavers' Progressive Association of Fall River, says that the Massachusetts State arbitration board has done good work, and in some cases has been the means of preventing strikes, and in some cases has been the means of settling strikes that would not have been settled otherwise. The arbitration committee should not wait until a strike occurs and then go in and try to settle it. If there is a dispute of any magnitude the State board ought to be informed and ought to try and effect a settlement. (575.)

Mr. T. O'DONNELL, secretary of the Fall River Mule Spinners' Association, says that the Massachusetts State board of arbitration has in many cases brought about a settlement of labor difficulties, but that it has rarely had anything to do with the settlement of strikes with which the Mule Spinners' Association has been concerned. There is no opposition on the part of the organization to the State board, but it has happened, as a rule, that when there have been any labor troubles in Fall River the matter has been settled by the operatives and the manufacturers themselves. (586.)

C. Board of Mediation and Conciliation, New York.—Bishop PORTER describes the Board of Mediation and Conciliation of New York, of which he is a member. The board was established by Dr. Felix Adler, Mrs. Josephine

Shaw Lowell, President Low, and two or three large employers of labor and two or three labor leaders, together with Bishop Potter himself. The purpose was to interpose in a conciliatory way between workmen and employers. The choice of a name was a matter of considerable discussion. The word arbitration was rejected because of its connection, particularly in the minds of the workingmen, with bodies created by the State. It was desired to exclude the notion of authority. The name Board of Mediation and Conciliation was ultimately chosen. The board has gained the confidence of the workingmen, and its assistance has repeatedly been invoked in strikes. The proceedings are conducted with perfect freedom and informality. The board met at first in a hall of a good deal of stateliness. The workingmen sat on one side and the employers and men like President Low on the other. After a meeting or two Bishop Potter saw that the thing was too stiff and formal, and he became satisfied that the workingmen would never talk freely under such conditions. He said that the next meeting would be held at his house. There they all sat around a table in his study, and smoked and drank coffee, and they were able to get at the bottom of the questions before them. Bishop Potter noticed two tendencies on the part of the employers which he had to contend with—one, to crowd the workingmen when they made statements which were not quite precise, and the other, a certain attitude of condescension or superiority.

Bishop Potter believes that the highest services which this board has rendered have not been the settlement of individual strikes, but the implanting in the minds of the working people of the idea that there are people of influence and character and position in New York who want to see fair play. (1, 2.)

D. Compulsory arbitration.—1. *General discussion.*—Mr. Brooks declares that many practical men have begun to ask for compulsory arbitration, not as a result of study or from any knowledge of the history of the theory of the subject, but as a result of their own experience. He thinks it probable that something like compulsory arbitration will have to be worked out for exceptional cases. (142.)

Mr. McCormack believes that the idea of compulsory arbitration is unpopular with the majority both of employers and employees. He himself is not prepared to advocate a general application of it; he would, however, introduce it in certain contingencies and in certain kinds of employment. A strike on a street-car line or an extended railway system jeopardizes the public welfare in ways which do not appear in a strike in an ordinary factory. These strikes on transportation lines have frequently resulted in the calling out of the force of the State in the form of the constabulary or the militia. The introduction of the force of the State at an earlier stage of the dispute, before the passions of the disputants have been so much aroused, would produce results more beneficial, with less public disturbance. Such intervention of the State would take the form of compulsory arbitration. For the dealing with interstate transportation agencies there should be a national board or court organized under a law of Congress.

For industries in general Mr. McCormack would not advocate compulsory arbitration, but he would approve a law forbidding either party to the dispute to inaugurate a strike or a lockout without undertaking to negotiate with the other party and offering to arbitrate. He would not wish to take away the power to strike; he would only insist that before striking workingmen make an effort to obtain a settlement in another way. It often happens that disputes reach aggravated forms just through mutual misunderstanding which would have been obviated if one party or the other had made a proper effort for negotiation. (50, 51, 54-59.)

Professor Commons finds that the labor people object to compulsory arbitration because they distrust the courts. Some employers feel the same objection. Professor Commons thinks that a distinction should be made between two kinds of compulsion—the compelling of the making of an award and the compelling of the enforcement of it. He believes that it would be practical and desirable to compel the disputing parties to come together and reach an agreement. The fact is that in most cases it would be only a minority on either side that it would be necessary to compel. The majority of employers and the majority of workmen will always be ready to come to an agreement; but if one-tenth of the employers in a trade stand out they can determine the action of the whole. A few employers maintaining unfair conditions can undersell the rest and almost compel them to maintain the same conditions.

The rendering of an authoritative decision by a body outside the contending parties and the enforcement of the decision raise quite other questions. If the decision were against the unions it would mean a compelling of personal service, and that is contrary to our ordinary view of a labor contract. Professor Commons

CXLIV INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

is inclined to think that the objection to such a procedure on the ground that it involves compulsory labor is visionary, but any procedure in that direction must be taken cautiously. (46, 47.)

Bishop POTTER regards the element of compulsion in the settlement of labor disputes as an element of weakness. It arouses antagonism. There will certainly be attempts to circumvent a compulsory law, and Bishop Potter has no doubt that they will succeed. A law which is circumvented and made a dead letter is far worse than no law. A law which should insure the offering of arbitration in labor disputes would, however, be valuable. "It would be of great moral value to put a person who was in the wrong conspicuously in the wrong in the public eye."

Strikes are so great an evil, so complete a reversion to barbarism, that Bishop Potter would think it worth while to try even compulsory arbitration if he were convinced that there was only a choice between it and strikes. He would not, however, feel much hope in trying for it. (7, 8.)

2. *Advocated.*—Mr. RIXEY believes that the State ought to intervene to compel arbitration in large classes of labor disputes. Such a strike as the St. Louis street-car strike of 1900 injures hundreds of thousands of people. The same is true of a railway strike. The right of the State to intervene is all the clearer in the case of transportation corporations such as were interested here, because they operate under franchises granted by the State; but Mr. Rixey would not confine compulsory arbitration to cases in which corporations are interested. He would draw a line similar to that drawn in the factory inspection laws. He would say that when a labor difficulty arises in any business in which a certain number of people are employed, arbitration should be required and enforced by public authority. At the same time he would not undertake to compel an employer to remain in business against his will, nor to pay wages which would make his business unprofitable. (66, 67, 71, 72.)

Mr. O'DONNELL is in favor of a law compelling both employers and employees to arbitrate and to abide by the decision of the arbitrators. (572.)

Mr. HARDING, a building contractor, would favor a law putting a penalty upon employers or employees who should inaugurate a strike or a lockout without first attempting arbitration. (110.)

Mr. CROXTON, president of the Boot and Shoe Manufacturers' Association of Philadelphia, would highly approve of "imprisonment or other penalty for anyone who caused a strike or lockout without first applying for arbitration." Yet he speaks elsewhere of compulsory arbitration as "impossible and a contradiction of terms." (331, 333.)

Mr. GOODWIN, a shoe laster, while strongly desirous of arbitration, fears that a law forbidding the inauguration of a lockout or a strike without a previous petition for arbitration would deprive the workmen of some of their rights. Yet, after further questioning, he says: "I think I come around to your way of thinking, now, that it would be right to have a penalty imposed in a case of that kind." (304, 305.)

3. *Deprecated.*—Mr. FOX is strongly opposed to compulsory arbitration. He does not think that the alleged favorable experience of New Zealand, with its much smaller and more homogeneous population, furnishes a sufficient argument for it. He believes that more can be accomplished through education and practical experience in arbitration than by coercive measures. Yet, in the case of a great strike which the public was strongly interested in having settled, such as a railroad or a street-car strike, if the employees had a reputable organization and demanded arbitration, he would be willing that the corporation be compelled to grant it, or that a national board have power to inquire into the workings of the corporation. (146, 149.)

Mr. WHITEHEAD believes in the arbitration of differences by employers and employees, but is opposed to compulsory arbitration. If there is any difference of opinion, the parties directly involved can settle the matter a great deal more advantageously than would be the case if a third party were brought in. If there were compulsory arbitration, it would depend a great deal upon the personnel of the board whether or not justice would be done. There would also be difficulty in finding means to give effect to the decision of the board. (574, 575.)

Mr. COLLINS, a shoe laster, believes in arbitration, and believes that attempts at conciliation should always precede a strike or a lockout. He would not, however, favor any attempt to enforce arbitration or conciliation by law. He does not think that such a law would be of any value against the employers. Existing laws are not enforced against employers except when labor organizations do it. He believes that compulsory arbitration would work exactly as the Philadelphia system works—hand over the affairs of the workmen to their masters. It is easier for the masters to secure the services of the workmen's representatives than to manage the whole number of workmen. (308.)

Mr. O'BRIEN, of the Granite Cutters' National Union, is emphatically opposed to any method of compulsory arbitration. He has not been favorably impressed with the arbitration boards with which he has come in contact. In his opinion there should not be any law to compel a man to leave his employment or change his employment. The employers are generally looking to get an advantage, and in case of compulsory arbitration they would succeed in getting the best end of the deal and the arbitration would be all one-sided. It is not arbitration when there is any compulsion about the matter. Arbitration must be by mutual consent, and nothing is ever accomplished by forcing people.

Elsewhere, however, Mr. O'Brien says that there ought to be a law providing that a railroad company should be deprived of its franchise in case it refused to confer with its employees in cases of dispute.

The law in the State of New York provides for a board of mediation and arbitration, which has the power to summon before it any individual and compel him to answer questions put to him. Through this method it is possible to let the public know who is at fault. That is all the power which the board has, and that is as far as the United States Government should go. (432, 437, 438.)

Mr. LEAKE, a manufacturer of cotton and linen fabrics, does not think it would be wise to try to compel even the holding of a conference between employers and employees unless the question at issue is one involving public franchises. The only difficulty when disputes arise and conference or arbitration is refused is unreasonableness on one side or the other. As we can never know the whole truth, and therefore can never say what is unreasonable, Mr. Leake does not see how legislation will avail. It is impossible to say to a man that he must employ another willy nilly. (277.)

Mr. CHASE, treasurer of the King Philip Cotton Mills, says that he should not favor a law compelling arbitration. He does not believe in the principle involved in it, though an agreement between the parties would be an excellent thing. The State may rightly and justly enact a law compelling arbitration, but the enactment of such a law is not expedient. (559.)

Mr. LAWSON, vice-president of the Builders' League of New York, says that he is in favor of arbitration, but not of compulsory arbitration. He believes that better results can be obtained by the appointment of arbitrators by each side. He would, however, favor a law forbidding the inaugurating of a strike or a lock-out without offering arbitration. (104.)

4. *Compulsory arbitration in New Zealand.*—Bishop POTTER refers to the statement of a man from New Zealand who said to him that the compulsory arbitration law works very well there, but that the social conditions there are very elementary, and that it is extremely doubtful whether such a law would work effectually under the complex conditions of greater communities. Bishop Potter would highly approve a law to provide such mechanism as that of New Zealand without the coercive feature. (3, 7.)

Mr. MCCORMACK, while believing that the New Zealand method of compulsory arbitration is excellent, does not think it could be applied under the conditions of this country. (58.)

Professor COMMONS is disappointed that the New Zealand law has resulted in the settlement of so large a number of disputes in court and so small a proportion outside. He thought that when men knew that they must be brought to a decision by proper authority they would prefer to reach it by conferences between themselves.

New Zealand and all the colonial possessions of England have the advantage over us in such matters, in that the judges are appointed by the Crown and are free from political influence. In this country the trade unions distrust judges who are appointed and the employers distrust judges who are elected. The situation is insoluble under our institutions. (48.)

E. Trade arbitration, negotiation, and joint agreements—

1. *Generally.*—Mr. LEAKE believes that arbitration and negotiation between workmen and employers are most desirable. It is best always for people to get well acquainted with one another. There is always ground of suspicion where there is ignorance. We should always strive to get at the truth; we can get only a little of it at best. But Mr. Leake thinks that a mutual acquaintance can best be brought about by regulation within the trade rather than by legal enactment. No doubt it will be brought about when conditions are ripe for it. (279-281.)

2. *Arbitration.*—Mr. FOX points out that organization of both employers and employees is necessary to permanent arrangements for trade arbitration. No system of arbitration can attain its greatest usefulness unless employers give the organization of their employees full recognition. Employers who desire to abolish strikes are ill advised and illogical if they refuse such recognition. (144, 145.)

Mr. Fox says that members of other national unions are inclined to think his union more favorably situated than theirs because the establishments of the trade can be divided into distinct and homogeneous classes. The homogeneity of the Stove Founders' National Defense Association is believed to have contributed to the smooth working of its agreement with the molders. Yet the agreement with the National Founders' Association, which is a composite organization, has been fairly effective in establishing a uniform rate of wages in the large foundry centers. (148.)

Mr. Fox believes that national arbitration and general wage scales can be introduced in any trade in which competition is general, as in the foundry business. It is not so practicable in trades of local competition like the building trades. (149.)

Mr. JACKSON, secretary of the Slasher Tenders' Union of Fall River, says that the operatives in textile mills have always been in favor of arbitration. There has never been a time when there has been a controversy with the manufacturers in Fall River when the operatives were not willing to leave the question of arbitration either to the State board or to citizens in the town. In every instance in which arbitration has been proposed, however, the manufacturers have refused to arbitrate. (581.)

Mr. O'BRIEN says that the board of delegates of the building trades and the members of labor organizations generally are in favor of arbitration in the settlement of disputes between employer and employee. There is no question but that that is the only system to adopt. In New York the question of arbitration was taken up by the building trades. A committee from the union was appointed to meet with the employers, and this committee practically agreed upon a plan of arbitration. This plan was reported to the board of delegates and submitted to the unions. The unions unanimously decided in favor of arbitration, and the plan was then submitted to the employers. Differences arose as to terms, and nothing came of the matter. (432, 437.)

Mr. McCORMACK is not prepared to assert that one of the two parties to labor controversies—employers or employees—is less disposed than the other to submit to arbitration, though his impression is that the employers accept it less readily. In the one serious instance of such refusal which he has in mind—a mining dispute—it was the employers who refused to make any concessions or to submit to any form of arbitration, though they were only asked to establish the same conditions in their mines which existed in other mines throughout the competitive district, and though the city council of Evansville and the board of trade asked them to submit to arbitration. The result of the conflict in this case was that eight persons were shot; it was never proved by whom. (52, 54, 56.)

3. *Negotiation.*—While Mr. McCORMACK has a high opinion of the value of arbitration in labor disputes, he would prefer settlement by negotiation within the trade whenever that is possible. He suggests that it is often impracticable, because men are not organized and have no machinery to carry it out. (54.)

Bishop POTTER believes in arbitration, provided it is entered into voluntarily, but he believes that friendly negotiation between employer and employee is better. When he has acted as arbitrator he has been sensible that the employers felt that he was meddling with what did not concern him. (11.)

Mr. O'DONNELL says that the manufacturers in Fall River are always willing to meet the representatives of the employees and to consider their grievances. When a question of wages which will affect all the operatives has been at issue, conferences have been held and efforts have been made to settle the trouble without resorting to a strike. These conferences of manufacturers and employees have been of great benefit to the city and have prevented strikes. (568.)

4. *Joint agreements.*—Mr. Fox speaks of the agreement made in 1891 between his union and the Stove Founders' National Defense Association. The essential features of it are that there shall be no cessation of work by reason of any dispute; that the parties immediately interested shall make an effort to adjust their differences; that if this fails the presidents of the two associations, or their representatives, shall try to conciliate and adjust the differences; and, as a last resort, that an adjusting committee, composed of three members from each association, shall finally decide the matter. It has been necessary to call in such a committee only once in 10 years. There has been no strike since the agreement was formed. The union had "had one severe conflict with the association in 1887, which left both sides pretty well sick of fighting," and brought about the agreement.

Among the things which have contributed to the success of this method of adjusting disputes, Mr. Fox names the requirement that the interested parties shall first make an earnest effort to settle their own differences; the fact that when outsiders are called in they are men thoroughly conversant with the technicalities of the trade, and so competent by their own knowledge to reach an intelligent decision; the facts that each side has a wholesome respect for the other's power of

resistance to injustice, and that years of fair dealing and success have produced increasing confidence. The wise policy of the stove manufacturers as to wages has also been of value. The manufacturers recognize that the cutting of wages does not relieve the evils of trade depression, but only intensifies them. Therefore, during the years of depression beginning with 1893, the stove molders' wages were not reduced. When better times came on in 1899, wages were raised 10 per cent, and in 1900 they were raised 5 per cent more. The molders asked for a greater increase each time, but the advances made were satisfactory compromises.

One of the benefits of the agreement is that it produces uniformity of labor cost, so far as practicable, in each competitive district. The country is divided into four districts. In each the hours are uniform, and wages are made uniform so far as practicable. Except in New England, employers outside the association generally follow the association's terms. (144, 145, 149.)

Mr. Fox says that in March, 1899, his union made an agreement with the National Founders' Association somewhat similar to that which it already had with the Stove Founders' National Defense Association. The National Founders' Association is a heterogeneous body. It admits to membership practically all foundry interests except the stove founders. It does not yet represent a majority of the several interests. The diversity of occupation of its members is a drawback to the successful working of its agreement with the molders. Moreover, a considerable number of the members are opposed to recognition of any labor organization and some of them made the mistake of declining to negotiate a settlement with the committees of their men and referring every dispute at once to the association. Many disputes over wages have been satisfactorily adjusted under the agreement, but on the whole it has not worked as well as that with the Stove Founders' Association. At the time of Mr. Fox's testimony a serious conflict between the National Founders' Association and the Iron Molders' Union was in progress at Cleveland, though in other places differences were being treated according to the agreement. (145.)

Mr. STEINBISS, general secretary-treasurer of the National Building Trades Council, is in favor of agreements between workmen and employers, but believes that they should be made by national organizations. He cites the allied printing trades, the metal trades (which are forming a national organization), and the building trades council. He hopes that some time an agreement between the National Building Trades Council and the National Association of Building Contractors can be brought about. (22, 24.)

Mr. Steinbiss believes that even local arbitration agreements ought to be made between bodies as large and centralized as possible. He suggests that in St. Louis the Manufacturers' Association, the Business Men's League or Mercantile Association, and the Building Contractors' Association, comprising the employers in nearly all industries, and the Building Trades Council, the Central Trades and Labor Union, and the Union Labor League might establish a board of arbitration by appointing each a member, so giving three to the employers and three to the employees, and letting the State labor commissioner be a seventh member. (29.)

Mr. Steinbiss says that the obstacles to the formation of agreements between employers and employees have come in most cases within his knowledge from the contractors. A conference board was established in St. Louis, but the contractors insisted that the members of the unions should agree to work for none but members of the contractors' association, and that the unions could not agree to. (22, 33.)

Mr. McCORMACK says that he finds an increasing appreciation among employers of the value of labor organizations, and of definite agreements with them as to wages and conditions of work. When the annual settlement has been made, the employer is left free to devote his attention to the other features of his business. He is able to take contracts, reckoning upon a definite and certain basis of cost; and when an association of employers deals with an association of workmen and arranges common conditions each employer is able to feel that he is meeting his competitors on a equal ground. (60.)

Mr. HARDING, one of the board of managers of the Builders' League of New York, says that his organization would be glad to have an agreement with the journeymen carpenters of New York. The advantage would be not so much in better feeling with the men as in putting the members of the league in a better position to compete with employers outside the organization. The existing condition of things under which every employer in New York hires carpenters at any rate that he can make, is of advantage to small employers, who are able to pick up journeymen at low wages. The majority of carpenters in New York City are getting less than they would get under a fixed agreement, but the advantage does not go to the men who take large contracts, neither does it go to those who have building to erect. Though wages may be low to-day, the contractor would hardly take

CXLVIII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

the risk of counting on these wages in estimating on a contract which could not be completed till some months hence. Indeed, the ability to know what work will cost at a future time is one of the great advantages which employers find in definite agreements with labor organizations. A large building may take 18 months to complete, and the carpenter work may hardly be begun until within 2 months of the end; but the contractor has to figure on it when the general contract is given out. Under such conditions as now exist in New York City no one can tell what the work will cost when the time comes to do it. The employers who do such work would be far better off if they had agreements with their men fixing wages definitely for at least a year ahead. (118, 114.)

Mr. HOURWICH says that the cloak-making trade in New York is a season trade, which has two seasons of activity during the year. Contracts are made between employers and workmen for each season; that is, twice a year. Sometimes they are made between the employer and the union. Sometimes they are made with individual workmen; but this is very unsatisfactory for both sides. Where the union does not intervene, the employer is likely to call a shop meeting and tell the hands to select a committee to arrange the rates of pay. It is all piecework, and the workmen have to go over the different styles and agree upon a price for every garment. The workmen have practically no means of enforcing these contracts except by strikes. The state of the law is such that it gives the union no redress if an employer cuts wages in violation of the contract and locks out the men to enforce the cut. (151.)

IX. BUILDING AND LOAN ASSOCIATIONS.

A. Development.—1. *Origin.*—Mr. ADDISON B. BURK, editor of the Philadelphia Public Ledger, says that the building association grew out of the custom of home ownership which had become firmly established in Philadelphia under the influence of the ground-rent system, which had been inaugurated in the early days of the city. By that system a man without capital could buy a tract of land on ground rent and erect his house upon it. The improvements which he made belonged to him absolutely, and he obtained the benefit of any increment in the value of the property. As the city grew in population land increased in value, and it became increasingly difficult to buy lots upon ground rent. It was then that building associations were formed. (596.)

2. *Growth.*—Mr. BURK says that the first building and loan association established in the United States was formed in 1837, in Frankford, which is now a part of the city of Philadelphia. There are at present 1,300 such associations in Pennsylvania, with assets of \$113,000,000, and 5,485 such societies in the United States, with 1,496,264 members, and assets amounting to \$575,217,903. The national associations are not included in these figures. (597, 598.)

3. *Different systems of organization.*—Mr. BURK says that there are two kinds of building associations in existence, one kind operating under what may be called the Philadelphia plan, and the other kind operating under what may be called the Dayton plan. The main difference is in the fact that the societies operating under the Dayton plan are large societies with a complex system of government, while the societies operating under the Philadelphia plan are, for the most part, small organizations, composed of members who know each other personally, or by reputation, and having a simple system of government. Usually the meetings are held in the evenings, monthly, and the officers serve either without pay or for nominal salaries. The business of the societies operating under the Dayton plan is carried on like that of a bank with salaried officers, who devote all their time to the work of the society, have offices open every day, and have clerks and other assistants. There is no objection, from a financial standpoint, to having skilled managers who are paid a salary, but the value of the association as a fraternal organization is lessened. The salary paid to the treasurer, or other salaried officer in the case of associations operating under the Philadelphia plan, is seldom more than \$300 to \$500 a year. In some instances one man is secretary of more than one association, and there are men who act as officers of a number of societies, who devote their whole time to the work of these societies.

There has never been a case in Philadelphia where a man, acting for more than one society, has used the funds of one to make up his accounts in the other.

The members of the building associations in Philadelphia are almost entirely Philadelphians. There is an objection to an association that has members living all over a State, because in such case the members could not meet together monthly. Financial success is quite possible for a State or national society, but such societies can not have the fraternal spirit which can be had in a purely local association. (598, 599, 600.)

B. Methods of business.—1. *Payment of premiums.*—Mr. BURK says that at the beginning the building and loan associations loaned money below the market rate, and that consequently their money was at a premium. Notwithstanding the premium, however, money could be obtained from them on more favorable terms than a similar amount could be obtained from a savings bank or other lender. There are a great many different plans of premium followed by different building associations. The most common method in use in Philadelphia is the method by which the premium is deducted from the amount of the loan; that is, the gross premium plan. For the last 5 or 10 years there has been no premium paid in the case of the Philadelphia societies, so that practically it makes no difference what the plan is. The laws of Pennsylvania do not require the payment of a nominal premium, as is the case in Massachusetts. The question of premium is a matter of very little importance, provided a member stays in the society for the whole term. Things are evened up, whether he pays a large or a small premium. (590, 600, 601.)

The trust companies are now competitors of the building associations and loan money on the same terms, but the building-association loan is still preferable, because, in case a borrowing member meets with misfortune, his fellow-members will do all they can to tide him over his difficulties, and the society will not foreclose his mortgage if it can possibly avoid it. (596.)

2. *Maturity period.*—Mr. Burk says that the average maturity period of building and loan associations at present is about 12 years. There used to be for the early series of the associations a shorter maturity period. The higher the premium the shorter the maturity period. A rate of earning of 7 per cent is necessary to mature a share of stock in 12 years. It is quite probable that building associations will be obliged in the near future to reduce their rates of interest. In that case the period of maturity will be lengthened. (600, 603.)

3. *Series of stock.*—Mr. Burk says that where stock is issued in series by the building associations the several series are assumed to be partners in the concern, the profits are divided according to the partnership plan, and the profits paid to each series are based on the total amount contributed by each. (603.)

C. Influence on industrial life.—Mr. BURK says that building associations have unquestionably had a great influence in preventing labor disputes and strikes and in preventing a resort to violence when strikes have taken place. Their whole tendency has been to make the relations between capital and labor cordial. Many of the members of the associations buy the houses in which they live, and they will not engage in a strike, except upon great provocation, for they do not want to give up their homes to go to another locality. Membership in these associations also gives a certain business training. The members learn to keep accounts, and obtain what might be called a practical knowledge of the value of money. The building associations have also tended to do away with socialism among workmen, and therefore such associations are greatly encouraged by employers.

The building associations in Philadelphia have been a factor in making that city a city of homes. The members of the associations scarcely ever build their own houses, but, as a rule, buy houses already built. In Philadelphia the kind of houses most in demand are those which cost about \$2,500. For that amount a house containing 6 rooms and a bathroom can be bought. In the early days the building associations were formed for the express purpose of enabling members to erect their own houses, but now the members find it a great deal better to loan their money and buy their houses where they please. Practically, the building associations are to-day loan associations with mortgage securities, and the members are investors rather than borrowers. At the present time the building associations yield a larger return on investments than do banks or trust companies, although in recent years the fall in the value of money has led the trust companies to follow the methods pursued by the building associations.

It is still the ambition of workmen to own their own homes. The development of trolley lines has made it possible for people to live outside of the city limits, and consequently the value of property within the city has fallen, and there are more houses for rent. (595, 596, 599, 602, 603.)

D. State supervision.—Mr. BURK says it is his opinion that the best thing which the State legislatures could do would be simply to authorize the organization of building societies, and then to let them alone. Governmental inspection of any sort is a disadvantage. If a society is managed by its own directors, the stockholders will look after it and see that it is honestly managed. If the State inspects its affairs, the stockholders will feel no responsibility. The demand for State inspection came from politicians who wanted an office. (600, 601.)

CL INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

X. BUILDING TRADES.

A. Organizations of employers and contractors.—1. *Builders League of New York City.*—Mr. LEO, president of the Builders' League, New York, says that this organization was formed about 1894. It is composed of employers of labor in the various building trades of New York City. About 800 firms and individuals are members of it, of whom perhaps 50 or 60 are general contractors. This is probably 25 or 30 per cent of the general contractors in the city.

About the same number of employers of this class belong to another organization—the Builders Club. Nearly all the members of the Builders' League are also members of the masters' organizations of their own trades. The dealings between organizations of workmen and organizations of employers are generally conducted by the trade organizations separately, rather than by the Builders' League on the one side and the Building Trades Council on the other. (95, 96, 99.)

Mr. HARDING, a building contractor, says that while the Builders' League may not include more than 25 or 30 per cent of the general builders of New York City, its members are the large contractors and do 60 or 75 per cent of the work. There is another organization—the Building Trades Club—which has more of a social character and is much less active in trade matters. Some men are members of both organizations. (106, 107.)

Mr. O'BRIEN, of the Granite Cutters' National Union, says that the members of the Builders' League of the City of New York are for the most part speculative builders. They tried at the outset to get men at lower rates of wages than the regular scale. They find it hard, however, to obtain men. Many of these speculative builders buy a property covered by a mortgage. During the process of building they get as much money as they can under the builders' loan. Then they fail to pay the workmen, the mortgage is foreclosed, the property is bought in by some stool pigeon, and the workmen lose their wages. Most of this speculative work is done in the upper district of New York City, and the houses built are for the most part poorly constructed. (426, 427.)

2. *Mason Builders' Association.*—Mr. O'BRIEN says that the legitimate organization of the builders of the city of New York is known as the Mason Builders' Association. The members do not build on speculation, but take a contract to build an entire house for the owner. Then they generally do the mason work and sublet the iron work, stonework, and plastering to members of the United Building Trades. (427, 431.)

3. *Cooperation of employers' organizations.*—Mr. LEO states that when labor difficulties arise a meeting of the Builders' League is called and steps are taken to assist the members who are in trouble by furnishing nonunion men or otherwise. In the latest instance the journeymen plasterers demanded, among other things, the privilege of selecting their own foreman. The great majority of the employing plasterers refused. The members of the Builders' League work for the most part in the upper portion of New York City, and the Master Plasterers' Association has its headquarters in the lower part of the city. In previous disputes, if there was a strike in the plasterers' trade in the lower part of the city the men in the upper part kept at work and supported the strikers. In this case the Builders' League determined to support the Master Plasterers' Association by laying off their plasterers until the trouble in the lower part of the city should be settled. The strike was over in 2 days. (96.)

4. *Organizations of employers opposed by organizations of employees.*—Mr. STEINBISS, general secretary-treasurer of the National Building Trades Council, states that the building trades unions are coming to feel an opposition to agreements with contractors' associations, because the contractors insist on a provision that no member of the union shall work for anyone except a member of the contractors' association. There are breweries and hotels and other large establishments which are obliged to keep a force of men, and such an agreement compels these establishments either to give their work to contractors or to employ nonunion men. Moreover, contractors' associations usually contain only a fraction of the whole number of contractors in a place, and the smaller contractors outside are compelled to get nonunion men. Further, when an association of contractors has got such an agreement with the unions, it will form a combination with the material men, and become a most dangerous trust, extorting such prices as it pleases from the public. An agreement of this character now exists in St. Louis between the bricklayers and the contractors, and it has been indorsed by the Building Trades Council. There is a contractor in the city who has been recognized for years as one of the best friends of union labor. He is a stonemason contractor doing general building. The master bricklayers' association has made a law that none but practical bricklayers shall be members of that association. This law, together with the agreement with the bricklayers' union, deprives this fair con-

tractor of union labor. The Building Trades Council feels the injustice of the situation, but can not escape from the contract it has sanctioned. The witness does not believe such an agreement will ever be indorsed by the council again. (23, 24.)

B. Labor organizations.—1. *National Building Trades Council.*—Mr. STEINBISS states that the National Building Trades Council was formed in December, 1897. It is a delegate body, composed of representatives of local building trades councils and representatives of national unions of workers in the building trades. The national organizations at present affiliated with it are the electrical workers, the painters, the sheet-metal workers, and the steam engineers. Each national union pays only \$10 a year to the National Building Trades Council, but the council has power to levy an assessment of 5 cents a member a week to support a strike or a lockout. The local building trades councils in 24 cities, chiefly in the West, are affiliated. Jersey City, N. J., and Worcester, Mass., are the only Eastern cities so far included. The organization has made little effort to extend itself. It has no paid organizers, and has only recently appointed volunteer organizers. The aggregate membership of the affiliated bodies, local and national, is about 350,000. The convention meets once a year, and the general executive board directs the affairs of the organization between conventions. The executive board consists of the president, the secretary-treasurer, and 6 vice-presidents. The tendency of the body is toward increasing the power of the executive board.

Among the objects of the body, as stated in the constitution, are the encouragement and formation of building trades councils and local unions, the closer amalgamation of building trades workmen, the establishment of the eight-hour day, the abolition of the contract system on public work, the equalization of wages in the different building trades, the introduction of a national working card, the establishment of a better feeling between employer and employee, and the securing of legislation in the interest of workers in the building trades. The constitution also declares the abolition of strikes or the reduction of them to a minimum to be one of the main objects of the organization. It also requests all local building trades councils to establish conference or arbitration boards with associations of master builders wherever practicable. By an amendment adopted by the last convention, the general executive board was directed to act as an arbitration committee in case of a strike or lockout when called on to do so by a local building trades council or an affiliated national body. The principle of the organization is local autonomy, yet Mr. Steinbiss believes that authority will be given to the general executive board to try to settle any dispute in which an affiliated body is engaged, and to withhold financial support unless an opportunity to effect a settlement is offered to it. Mr. Steinbiss thinks that if the Chicago building trades council had submitted its dispute with the employers in 1900 to the National Building Trades Council a settlement would have been reached. (12, 18, 18-20, 24.)

Mr. Steinbiss declares that it is not the policy of this organization to boycott unions which are not affiliated with it. The carpenters in St. Louis have at times been outside the Building Trades Council, and yet the council has even aided them in their grievances. (22.)

Mr. Steinbiss says that the council asks contractors and real estate men and architects and builders to employ none but men in possession of the Building Trades Council working card. This card is issued by the national organization and from the office of its secretary. Each affiliated local building trades council must take out this working card for all its members in good standing. Possession of the card shows that a man has paid his dues to his own organization and is a member of it in good standing. The members may also be obliged to hold the dues cards of their own unions, according to their union laws; but wherever the National Building Trades Council has jurisdiction its card is the only working card recognized. (16, 19; 21.)

Mr. Steinbiss states that the local building trades councils in the various cities are organized on substantially the same plan. They differ with regard to the number of trades included and the number of representatives from each trade. Every trade, large or small, has regularly the same representation, and Mr. Steinbiss believes that this plan of treating each organization as a unit is the right plan for such federal bodies. In St. Louis there is a board of business agents, which is also a board of arbitration. It meets every day at 4 o'clock. The members are elected and paid each by his own union. In their daily meetings they make reports and decide what shall be done by their board. This board reports weekly to the Building Trades Council. The board of business agents is placed distinctly under the jurisdiction of the council. This was found to be necessary, because in New York at one time the board of walking delegates was an entirely separate body, and was able to control the situation without reference to the desires of the Building Trades Council. Mr. Steinbiss believes that the

CLII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

constitution of the Building Trades Council of St. Louis has been the model for nearly all the councils that have been formed in other cities." (13-15, 20.)

3. *Board of Delegates of Building Trades.*—Mr. O'BRIEN, of the Granite Cutters' National Union, says that the Board of Delegates of Building Trades was formed for the purpose of bringing the members of the different organizations in the building trades into closer affiliation. The representatives of labor who are members of the board of delegates have power to act for the organization which they represent between meetings. They must be given that power before they are admitted to the board, and they are governed by a constitution and by-laws which are submitted to the organizations for their approval. When a grievance is presented it is the duty of the delegates, having men working on that particular piece of work to investigate the grievance. At least 90 per cent of the grievances reported are adjusted through committees without any trouble. The majority of the local organizations have yearly agreements with their employers, fixing the rate of wages and conditions generally. In case of the infraction of a rule by a union the matter would come before the board of delegates. From 27 to 30 trades are represented in the board.

If a case were found in which members of the union were violating rules, the delegate representing that particular trade could order a strike in that trade. If the assistance of other trades were desired, a grievance would have to be put into the hands of the board of delegates in the regular form. It is very seldom that men are ordered on a strike until every honest means has been taken to adjust the difficulty. The delegate is supposed to see that the working rules are all complied with, and in case of any dispute is supposed to interview the employer and adjust matters if possible, acting at all times under the instructions of the organization which he represents. In former years it was found that where an individual workman presented grievances to his employer, he would, in nine cases out of ten, be discriminated against sooner or later. Now, when a representative of the organization deals with the employer, it is impossible to discriminate against individual workmen. The delegate is inclined to be conservative in his action because he wants to be in a position to show that he was justified in doing as he did. Otherwise a new delegate would be appointed. Every precaution is taken to avoid a strike, and one is ordered only as a last resort.

When there arises any dispute between two organizations concerning the question of jurisdiction, the difference is arbitrated by the appointment of representatives from each side to consider the point at issue.

To a certain extent, a delegate who does his duty, finds it very hard to secure employment. A large number do find employment, however. It is not necessary for the representative of a labor organization to become an object of antagonism on the part of employers. (423, 424, 430.)

8. *Attitude of employers.*—Mr. STEINBISS says that the best builders and contractors are friends of the organizations of the building trades workers. The unions give them better mechanics, and they prefer to deal with a committee rather than every Tom, Dick, and Harry. The large contractors are also favorable to the central delegate bodies, called councils. It is the small contractor, "the man who hires and picks up anyone on the street that works for cheap wages," who opposes the councils and the unions. (15.)

Mr. LEO says that neither he nor his organization has the slightest objection to organized labor. (101.)

C. *Relations of employers and employees.*—*Negotiations in the carpenter trade.*—Mr. HARDING gives a detailed account of the negotiations between the Master Carpenters Association and the Brotherhood of Carpenters in New York City in 1899 and 1900. Up to September, 1899, carpenters received \$21 a week for 48 hours' work. In that month the workmen presented a demand for \$23 a week for 44 hours' work, with absolute prohibition of work between 12 m. and 5 p. m. on Saturdays. The manufacturers considered this last demand particularly unreasonable. They were willing to give the Saturday half holiday, but they thought they should be permitted to do work on Saturday afternoons by paying double for it. They have this privilege on Sunday and at night. In the office-building section of the city it is often necessary to make repairs and alterations between the time when the offices are vacated on Saturday afternoon and the time they are occupied on Monday morning. For such purposes Saturday afternoon is invaluable.

A committee of the Master Carpenters' Association met a committee of the workmen and made a temporary agreement for wages of 40 cents an hour for a Saturday half holiday, and for an arbitration committee to settle other points of difference. The representatives of the union which agreed to this compromise said that they had power to settle the dispute; but the day after the agreement

was signed the manufacturers received word that the committee had no such power; that they had signed the agreement on their own responsibility, and that the original demand would be lived up to. Finally, on October 4, the master carpenters yielded.

No definite time was fixed for the continuance of the agreement which was thus formed, and it was therefore liable to be abrogated at any time. The master carpenters asked the journeymen to appoint a committee of arbitration to arrive at some amicable understanding whereby yearly agreements could be made. A committee was formed, and from February 15 to August 15, 1900, the master carpenters tried to effect an arrangement. The journeymen did not keep their appointments. A day would be set for the conference and the committee of the journeymen would not appear. When the masters asked the reason, an entirely new committee would come with new propositions. Finally, on August 15, 1900, the Master Carpenters' Association passed resolutions declaring that it was inexpedient to hold further conferences with committees from the brotherhood until such committees should have full power to act on the matters under consideration, and declaring further that the agreement made on October 4, 1899, was terminated and of no effect on and after August 20, 1900. So at the time of Mr. Harding's testimony, November 15, 1900, no agreement existed between the master carpenters and the journeymen in New York City. Every employer hired carpenters on such terms as he could make. (110-118.)

D. General conditions of labor.—Wages of bricklayers.—Mr. LEO says that the present wages of bricklayers in New York are 55 cents an hour, and that he questions whether they ought not, in fairness, to be 60 cents an hour. Their wages would then be equal to only 80 or 85 cents an hour for steady work. The weather does not let them work over half the time. The work is hard and often dangerous and ought to be well paid. (98.)

E. Legislation relating to building trades.—Mechanics' liens.—Mr. O'BRIEN says that labor organizations in the State of New York have tried to secure an amendment to the mechanics' lien law, providing that persons lending money on property should be obliged first to ascertain whether or not there were any claims for wages against the property. Many of the contractors and the persons who loan money stand in opposition and prevent the payment of the men who furnish material and labor. (436.)

XI. STONE AND GRANITE CUTTING TRADE.

A. Granite Cutters' National Union.—Mr. O'BRIEN says that the Granite Cutters' National Union was formed in 1877. The organization has complete jurisdiction over all the granite work in the United States. Each local branch makes its own rate of wages, but the rate is under the supervision of the national organization, or executive board, which is composed of the national union officers. About 98 per cent of the granite cutters in the country belong to the association, which has about 16,000 or 17,000 members. All the money is centralized. The local organizations are allowed a certain amount for legitimate expenses. The rest is all sent to headquarters. When there is a strike which has taken place with the approval of the union, the funds of the national organization are drawn on to pay the strike benefits. Many of the branches have a local fund raised by local assessments. The union is affiliated with the Board of Delegates of the Building Trades and with the Central Federated Union of the City of New York. (422, 431.)

B. Relations of employers and employees.—Mr. LEO says that there was harmony in the stone-cutting trade in New York for 8 or 10 years, up to about 1897. At that time there was a strike over the proposal to change the time of making the annual agreement. New agreements were customarily made on the 1st of May. At that time of the year the yards are full of work and the employers can not afford a contest. They wanted to make the agreement expire in February, when work is slack. After a strike of 10 or 12 weeks, the Master Stonecutters' Association yielded completely, and in addition, paid about \$12,000 in fines into the treasury of the union. (97, 98.)

C. Apprenticeship.—Mr. O'BRIEN says that a system of apprenticeship has been adopted by the granite cutters. In New York 1 apprentice to 10 men is allowed. In some other localities there is a more liberal allowance, and in some the allowance is less liberal. The sons of members of the union have been allowed to become apprentices even in cases where the employer has had his regular allowance. There are no subdivisions in the granite-cutting trade. All the workmen are called granite cutters, no matter what class of cutting they do. (429, 430.)

D. General conditions of labor.—1. *Wages.*—Mr. O'BRIEN says that the wages paid to granite cutters are usually based on time and not on piece work. The wages in New York are 50 cents an hour for an 8-hour day. The wages used to be \$2.75 a day for 10 hours' work. Wages do not make so much difference if the trade is thoroughly organized, as in that case all the employers have to pay the same wages. In the New York union there has been no change of wages in 8 years. When a change is to be made, a committee on the bill of prices is appointed from the union. After the members of the committee have agreed among themselves, they report to the local organization. If that approves, the scale is sent to the national officers. If they consider the scale all right, it is submitted for vote to all the unions in the country. The members of the union are more competent than are the employers to make out the bill of prices. (425, 426, 431.)

2. *Hours of labor.*—Mr. O'BRIEN says that the hours of labor for granite cutters are uniform all over the country, and a day's work consists of 8 hours of labor. When the demand for 8 hours was made, a committee was appointed by the union at large. This committee drew up a section, which was embodied in the constitution, providing that none of the members of the Granite Cutters' Union should work more than 8 hours a day. The employers were notified of the change in 1897, and told that it would go into effect after March 1, 1900. They were thus given 3 years to get accustomed to the change. The granite cutters have become more proficient all the time, so that now more is accomplished in 8 hours than formerly was accomplished in 10 hours.

The adoption of the 8-hour system gives occupation to a greater number of workmen. The Saturday half holiday would have the same effect.

In the State of New York there is a law providing that in all public employment 8 hours shall constitute a day's work. The law has worked well, and the superintendent of public works in the city of New York says that he would not care to go back to the old system, but thinks that the work is done much better under present conditions. (422, 425, 429, 434.)

E. Legislation relating to granite cutting.—Mr. LEO states that the so-called Tobin law enacted in New York in 1893, requiring that all granite used on municipal or State work in New York shall be dressed at the place where it is used, has almost stopped the use of granite for such work. There is not demand enough in New York city to justify the introduction of machinery for the turning of heavy columns and the like, and it is, therefore, impracticable to conduct the dressing of such pieces on the ground. (87.)

Mr. HARDING says that there are certain pillars and columns in some large buildings which no machinery in the State of New York can handle. The result of the law forbidding the use of any granite finished outside of New York State for municipal or State work, therefore, is that some other stone has to be used in place of granite. Mr. Harding has heard it said that the granite used in one addition to the museum of Central Park cost over \$100,000 more than it need have cost if it had been cut outside the State. (108.)

Mr. O'BRIEN says that the Tobin stone-dressing law in force in New York, and providing that in all work done for the State the stone used must be dressed within the boundaries of the State, has been quite beneficial. The people of the State are entitled to the benefit of the work which is done for the State. The law has, to a certain extent, led to the lowering of the cost of dressing stone. In the Eastern States the wages are such that a man is not encouraged to do any more in the course of a day than he is obliged to do. It has been found that since the law went into effect the dressing of stone has not cost more than it did before, and the State has had the benefit of having the money kept in circulation within the State. (427, 428.)

XII. POTTERY TRADES.

A. Development of the pottery industry.—1. *Generally.*—Mr. WILLIAM BURGESS, president of the International Pottery Company, says that as early as 1765 a pottery was established in South Carolina, which was of sufficient importance to cause alarm among the then well-established potteries of England. From that time on a number of attempts were made to establish potteries, but it was not until 1863 that the industry became of any commercial importance. From that time until the Centennial Exposition the business steadily increased in magnitude, and the quality of the wares rapidly improved. The exposition of 1876 gave, perhaps, the greatest impetus to the industry, as it acquainted the world with the possibility of this country's resources, and revealed to the manufacturers their own latent possibilities. At that time little decorated ware was being made. The demand for decorated goods, however, increased so rapidly that one manufacturer after another found it necessary to establish a decorating department.

Soon after the establishment of decorating departments came the development of the so-called sanitary wares.

The largest pottery manufactory is situated at East Liverpool, Ohio. That factory makes a number of different kinds of goods. It makes a very fine grade of hotel china; it makes semiporcelain goods, white granite, C. C., yellow, and Rockingham wares.

The Ceramic Art Pottery, of Trenton, N. J., makes goods of the very finest grades. They are beautiful and high priced. The Rookwood Pottery, of Cincinnati, makes an entirely different line of goods, which are exquisite in finish. American potteries are to-day, in fact, making, in all lines of clay products, wares equal in quality and variety to the very finest made in any part of the world, except that, perhaps, they do not make china which is equal in quality to some of the best grades of French china.

During the last half century the pottery business has developed from almost nothing to a business in which there is invested some \$18,000,000, and which employs 20,000 persons. The principal center of the industry is Trenton, N. J. (604, 605, 606, 608, 609.)

2. *Manufacture of sanitary wares.*—Mr. JOHN A. CAMPBELL, general manager of the Trenton Potteries Company, says that the manufacture of sanitary ware in the United States was first attempted in 1872. Previous to that time all sanitary ware was imported from England and Scotland. At the present time, such advance has been made in the industry that there are practically no importations of sanitary ware, and American manufacturers are exporting their goods in increasing quantities to all parts of the world. The sanitary articles manufactured in this country conform to the latest sanitary regulations, and are far superior in design and utility to those produced in any other country. Furthermore, improvements are constantly being made, and the industry is keeping pace with the general demand for the highest sanitary appliances known. The vitrified sanitary china and earthen ware manufactured in the United States is the very best article of its kind in use.

Solid porcelain goods, which are also classified as sanitary wares, and which are made of fire-clay ware with a white lining and glaze, were manufactured in this country as far back as 1880, but only comparatively small articles were made. The first successful attempt to make solid porcelain bath tubs was made in 1893. At that time few solid porcelain bath tubs were used in this country, and all those used were imported. At the present time, American manufacturers not only control the American market, but are exporting these goods to European countries. The price has been reduced at least 50 per cent, so that now these goods are within reach of people of moderate means, and a solid porcelain bath tub can be bought for about 40 or 50 per cent more than the cost of an enameled iron one.

The output of sanitary wares in this country runs from \$2,000,000 to \$3,500,000, and there are about 1,500 or 1,800 persons employed in the industry. (624, 625, 629.)

3. *Manufacture of tiles.*—Mr. ALFRED WILLSON LAWSHE, secretary and treasurer of the Trent Tile Company, says that the tile business is the youngest of any of the clay industries in the United States. Practically, it is only 20 years old. Between 1876 and 1880 a few tile factories were built in this country, but the English manufacturers controlled the market. In 1880, at an exposition held at Crewe, England, an American tile manufacturer was awarded the gold medal over the English and Continental manufacturers. That incident gave an impetus to the tile business in this country. Architects throughout the country began to think that American products were better than the foreign products. Soon the Trent tile plant was erected at Trenton. As soon as American manufacturers began to put their goods on the market, however, the importers of foreign goods decreased their prices. At that time, because of a difference of classification made by different appraisers, imported tiles paid only 20 per cent duty at New York and Philadelphia, while they paid 45 per cent at Boston. The matter was brought to the attention of the Secretary of the Treasury, and the duty was fixed at the uniform rate of 45 per cent. From that time on the industry has steadily grown until now there are 18 factories in this country. There are probably three or four million dollars invested in the business, and some 2,500 people are employed. The Trent Tile Company employs 285 hands, about 70 per cent of whom are women and children, the children being over the age of 15 years.

At first only embossed tiles were manufactured. These have gone out of favor now, and plain enameled tiles are now manufactured for the most part. When the demand for sanitary goods came a nonabsorbent tile began to be produced. The prices of white tile and the prices of white marble are about the same, but white marble is not as good a ware for sanitary purposes because it is absorbent, while a fine vitrified tile is absolutely nonabsorbent. If there is any white marble which is nonabsorbent it is probably so high priced that it can not be advantage-

CLVI INDUSTRIAL COMMISSION—MANUFACTURES AND BUSINESS.

ously used. One of the grievances of the tile manufacturers is that the Government uses marble almost to the exclusion of tile. England, on the other hand, tiles all of her Government buildings. There is not any artificial marble made that will stand the abrasion that a tile will stand.

The same materials are used in the manufacture of tiles as are used in the manufacture of ordinary pottery and china ware. The materials are ground to a flour. The flour is sifted into a box and then pressed. After being pressed into shape, the tile is bisque-fired in one kiln and then gloss-fired in another.

To-day American manufacturers are selling 90 per cent of all the tile sold in the United States. It is the opinion of manufacturers that American tiles are superior to foreign-made tiles. (630, 631, 632.)

4. *Facts favorable to development.*—Mr. BURGESS says that the high premium on gold during the Civil War was a great aid to the development of the pottery industry. The natural resources of the country have aided greatly in its development. The bulky nature of the cheaper grades of goods and the length of time which necessarily elapses between the placing of an order with foreign manufacturers and the receiving of the goods have worked in favor of the development of the American industry. The Centennial, the New Orleans, and the Chicago expositions, by showing the possibilities of American manufacturers, aided the growth of the industry in this country. The information obtained by the Tariff Commission of 1893 gave to legislators some idea of the extent and value of the industry and brought about the enactment of tariffs which were protective. The demand for more artistic and costly goods, which has been created by the increased wealth of the country, has been met by American manufacturers, and so has aided the growth of the industry. The opening of ceramic art schools in recent years has been of great assistance in the production of superior grades of ware, and the growing feeling among the people that goods of American make are desirable, together with the real merit of the goods produced, has been a great stimulus to the business. (606.)

Mr. CAMPBELL says that the progress made in the manufacture of sanitary wares is due to the fact that the protective tariff has made experiments possible and that manufacturers have persevered in making experiments. It is due also to the skill and progressive workmanship of the employees. (625.)

Mr. WILLIAM CLAYTON, representative of the Jiggermen and Dishmakers' Union, says that the pottery industry would be very much assisted if the Government would appoint men trained in the pottery business to investigate various sections of the country where materials suitable to the pottery industry may be found, in order that, if possible, American manufacturers may be relieved from the necessity of having to depend on England for any of the clays which are necessary in the manufacture of pottery. The Government could further assist in the development of the pottery industry by encouraging the establishment of technical schools in which students may be trained in the arts and sciences which apply to the pottery industry. In Europe schools of this character have been established and are encouraged by government patronage and assistance.

The duty on china and earthen ware should be a compound of specific and ad valorem duties, and the tariff law should be made more perfectly operative by the appointment of a larger number of inspectors who are thoroughly practical and well acquainted with the pottery industry. Inspectors should be appointed at pottery districts in foreign countries, as well as added to the customs officials in this country.

Freight discriminations should be done away with through remedial legislation, and rates should be made uniform. (636, 637, 638, 640.)

5. *Facts unfavorable to development.*—Mr. BURGESS says that the want of adequate government protection has been the feature which has been most unfavorable to the development of the pottery industry. It is only in recent years that the pottery business in this country has been considered a factor worthy of much governmental attention. The wages in the pottery industry are much higher in this country than in Europe, and the rate of duty imposed upon foreign goods, though seemingly large, has never been commensurate with the difference in wages. Another fact which has operated against the pottery industry is that it requires a large amount of capital to start a plant on a paying basis. Furthermore, there is a lack of skilled labor and of men of artistic education and taste. The want of technical schools has retarded the growth of the industry. The general tendency on the part of the American people to think that imported articles are superior to domestic products has been one of the most difficult obstacles to overcome. The greatest of all setbacks in recent years was the enactment of the Wilson tariff law, which gave the industry such a stunning blow as to paralyze it for years. (606.)

Mr. CLAYTON says that American manufacturers are obliged to import certain

grades of clay which are necessary to the production of crockery ware from England; that almost every manufacturer in this country is obliged to use these clays, and that no substitute for them has as yet been found in this country. The lack of technical schools is also a handicap to the pottery industry, and discriminations in freight in favor of foreign manufacturers act as a great drawback. Railway companies acting jointly with steamship lines are carrying goods from the seaport to inland points at a rate considerably less than is charged the home manufacturer to the same points. For instance, goods can be sent from Liverpool, England, to San Antonio, Tex., for 40 cents a hundred, while the rate from Trenton to San Antonio is 98 cents a hundred. On January 1 of last year the official classification of a number of articles was raised, and this has been a disadvantage to the pottery manufacturers. Defects in the present tariff law act also as a drawback to American manufacturers. The ad valorem duty makes undervaluation possible. The largest foreign shippers of china and earthen ware to this country have their own agents here to whom they ship goods, and in cases like Germany, where no oath is administered by the consul, the manufacturer may invoice his goods at any price he chooses, and take his chance of a revaluation at the port of entry. Under the present system it is possible for what is known as "stuffing" to prevail to a great extent. Stuffing means that a manufacturer, who is packing hollow ware for export, incloses in the hollow ware finished articles which do not appear in the invoice, and which are of much greater value than the goods which do appear in the invoice. In Germany there is in existence what is known as "omnibus" invoicing, which means that goods are lumped together and no descriptive invoice made out. (636, 637, 638, 639.)

B. Conditions of capital and business.—1. *Trenton Potteries Company.*—Mr. CAMPBELL says that the Trenton Potteries Company was formed by the consolidation of five plants engaged in the manufacture of sanitary wares. Since the formation of the company one additional plant to manufacture solid porcelain goods has been erected. The company is capitalized at \$3,000,000. The output of the company is probably about one-third of the total output of the country in sanitary wares. Some economies have been effected by the consolidation of the different plants, but there has not been as much economy as was anticipated. The prices of the goods manufactured have been reduced 50 per cent during the last 10 years. The reduction in price is due in part to the consolidation of the different companies; but only in part. (626, 627, 629.)

2. *Quality of American pottery manufactures.*—Mr. CAMPBELL says that American manufacturers can and are producing at the present time table china which is equal to any china that is made in Limoges. The Ceramic Art Company, of Trenton, is manufacturing as fine a china as can be made. American potters have passed the experimental stage in making a glaze. The Maddock Pottery Company, of Trenton, is also producing a very fine grade of china. Its kilns are built upon the French principle, and the company is producing ware that is holding its own with the best in France. There is a certain prejudice on the part of the American people against American-made goods, but that prejudice is being overcome. (630.)

Mr. CLAYTON says that there is not much difference between the quality of American pottery and the quality of English pottery. The operatives in this country are capable of producing as fine work of every kind as is produced in England. In some of the expensive articles it may be that not so much pains is taken in the finish, but this is not the case in regard to general ware. The pottery manufacturers of Trenton have succeeded in obtaining a greater degree of perfection than formerly in the mixture of materials, and have been able to calculate to a very great nicety the coefficient of expansion and contraction of the body and glaze under heat up to a given temperature. As a result the glazes are now compounded with greater accuracy to fit the body on which they are placed, and as a consequence there is less crazing than formerly. (639, 642.)

Mr. JOHN A. O'NEILL, a pottery worker of Trenton, says that American pottery manufacturers can make as fine goods as can be made anywhere in the world. The American pottery workers are the best in the world and know more about the business than do the foreign potters. (655.)

Mr. JOHN W. MORGAN, a pottery worker of Trenton, says that the underglazed ware which is made by the American manufacturers is much better than any which foreign manufacturers can produce. American manufacturers are able to produce as fine and delicate ware as the Haviland china which is made at Limoges, so far as the body of the china is concerned. They are not equal to the French manufacturers so far as finish and delicate decoration are concerned. There are not artists in this country who are capable of doing that class of work, the reason being that there has been no call for that kind of work in this country.

OLVIII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

There has been a prejudice against high-priced decorated American ware. The prejudice is somewhat dying out, but it still exists, and will exist until it becomes the fashion to patronize home products. Some American manufacturers deceive consumers by stamping their products as foreign made. Mr. Morgan can not say whether the pottery workers who are engaged in the manufacture of American goods which are sold as foreign products are in general paid higher wages than other workers. He himself is engaged in the manufacture of such goods and gets about 14 per cent more in wages than he would otherwise earn. (649, 650.)

3. *Import trade.*—Mr. BURGESS says that the foreign pottery manufacturers have an advantage over American manufacturers in freight rates. Goods from Liverpool, England, are laid down at St. Louis, Kansas City, and at almost any of the Western towns at considerably lower rates of freight than can goods from either East Liverpool or Trenton be laid down at those points. For example, the last rate of freight from Liverpool, England, to St. Louis was 27 cents a hundred, while from Trenton to St. Louis the rate was 41 cents a hundred. Goods are landed at Philadelphia from Liverpool, England, at only 5 cents a hundred more for freight than similar goods can be landed in Philadelphia from Trenton, which is only 30 miles away. The tariff is not sufficient to overcome the difference in freights so far as Western trade is concerned. In one instance English manufacturers were landing their goods at San Francisco for \$2.50 a ton, while the rate from Trenton to San Francisco was \$37 a ton. Under these conditions the Western trade of Eastern potteries is not of much consequence. The English goods go through in bond, and the examination made by the customs authorities is often not satisfactory. Many of these goods are landed at Newport News, and the examinations made there by the customs authorities have been defective and inefficient. A specific duty would remedy matters somewhat.

The pottery manufacturers in this country were formerly much alarmed over the prospective importation of Japanese goods, but since they have learned that there is no certainty that the importer will get his order filled after he has placed it they have felt much less uneasy at the thought of Japanese competition. (609, 610, 611.)

Mr. MORGAN says that Germany is the greatest competitor of this country in the pottery industry. Germany can land goods in our cities at a lower price than that for which the goods can be produced in this country. The conclusion seems to be that no duty is ever paid on German goods, although there is no absolute proof of this fact. If the duties were properly collected, the present tariff would be sufficient for the protection of the pottery industry, but, as a matter of fact, the duties are not properly collected and the law is not severe enough in its punishment of those who evade the payment of duties. There ought to be a more rigid examination of imported goods. This is the opinion of the pottery workers in general. The customs officials say that they have not the time to make a sufficiently rigid examination. (648, 649.)

4. *Export trade.*—Mr. LAWSHE says that there is a fair export trade in tiles with Australia and Holland, and there is every reason to think that the trade will grow, as only good reports are heard concerning the tiles which are sent abroad. (632, 633.)

5. *Inequalities of freight rates.*—Mr. LAWSHE says that the manufacturers of tiles have some reason to complain because of excessive freight rates to Western points. They can ship goods to Sydney, Australia, at 50 cents a hundred, while they have to pay 57 cents a hundred for goods shipped to Omaha, and 43 cents on goods shipped to Galveston. Complaints have been made to the Morgan Line and to the Sunset Route, but such complaints have availed nothing. The manufacturers of tiles have an agreement to equalize freight rates. This agreement is that a freight rate shall not be any more from one factory than from another. For example, the freight rate from Zanesville to Galveston is 48 cents, while the freight rate from Trenton is 43. The Zanesville manufacturers would have to pay to the Galveston buyer the difference between freight at 43 and freight at 48. The transaction is entirely with the dealer. There is no clearing house of the manufacturers, but simply an agreement to equalize freight rates. A manufacturer is enabled to compete in all parts of the country, though, on account of the great difference in freight rates, it would not be possible for him to sell in remote sections. (634, 635.)

6. *Sales methods.*—Mr. LAWSHE says that tiles are sold directly to mantel and tile houses. The dealers in mantels and tiles take contracts on buildings and employ the tile setters. The tiles sold abroad are sold through agents. (633.)

7. *Raw materials.*—Mr. BURGESS says that there are three main ingredients used in the manufacture of pottery—flint, feldspar, and clay, or kaolin. The finest feldspar comes from Maine. The flint comes from a number of the Middle States, while the finest china clay and kaolin come from Florida. A great deal of the

clay used comes from Delaware. There is not so much difference in the price of the different qualities of the materials as there is in the freight rates. (808.)

Mr. O'NEILL says that there have not been discovered in this country as good materials used in the manufacture of pottery as are to be found abroad. Relatively less of imported material is used each year, however, and the time is drawing near when no materials will have to be imported for the pottery industry. (655.)

Mr. CAMPBELL says that some of the clays and other materials used in the manufacture of sanitary wares are found in this country and that some are imported. (625.)

8. *Belleek*.—Mr. CLAYTON says that belleek has a greater degree of vitrification than has china, and consequently is more fragile. More feldspar is used in its manufacture than is used in the manufacture of ordinary earthenware. In addition to the use of more feldspar, ground flint glass is used in the manufacture of belleek. The formula used in the manufacture of belleek in Trenton is practically the same formula which has been used for years in Ireland in the manufacture of that ware. (642, 643.)

9. *Effect of tariff legislation*.—Mr. BURGESS says that the pottery industry could not exist without the protective tariff, under present conditions. The only way in which the industry could be continued would be through the reduction of wages. Present duties are satisfactory if properly collected. (611.)

Mr. CAMPBELL says that in his opinion the manufacture of sanitary goods would continue in this country if the tariff were removed, provided that Germany did not become too much of a factor in the production of that grade of goods. About three quarters of the pottery industry, however, would be destroyed if deprived of tariff protection. The prosperity of the manufacturers of sanitary wares depends, of course, on the general prosperity of the country. (628.)

Mr. O'NEILL says that the pottery worker would be the first to suffer if the tariff on pottery were reduced. It would be absolutely impossible for pottery manufacturers to pay the present rates of wages if there were a reduction in the tariff on pottery. The wages paid in all branches of the pottery industry are much higher than are the wages paid in Europe, and a tariff is necessary for the protection of the industry. (651, 656.)

Mr. LAWRENCE says that the reduction of the tariff on tiles would injure the tile industry in all branches. Only a limited quality of a special kind of tile is exported, and American manufacturers are able to export those tiles because they are goods which the English and foreign manufacturers do not make at all. (635, 636.)

10. *Prosperity of business*.—Mr. CLAYTON says that the pottery industry is in a very flourishing state at present, though under the Wilson law there was great depression in the industry. (641.)

Mr. O'NEILL says that for some years previous to 1893 the pottery industry was in a prosperous condition. The workers were fairly well employed and the rate of wages compared favorably with the wages in other skilled trades. At the beginning of 1893 a very disastrous and deplorable condition began. Within 18 months practically every pottery in the city of Trenton and in the country generally was closed. The scales of wages in the various branches of the industry were reduced. The men refused to accept the reduction proposed, as it was utterly impossible to live on the wages offered. The cause of this depression in the industry was the change in the tariff on pottery made by the enactment of the Wilson tariff law. The mistake made in the enactment of that law was rectified 4 years later, and the pottery industry now is in a flourishing condition. (651.)

C. *Labor organizations*.—1. *Generally*.—Mr. O'NEILL says that the first national organization of pottery workers was formed in 1880. Previous to that there had been local organizations not working in harmony with each other. The national organization formed in 1886 went to pieces in 1892. It was succeeded by the National Brotherhood. When the National Brotherhood agreed upon a uniform scale of wages with the manufacturers trouble resulted, as some of the local branches of the organization were not satisfied with the scale adopted, and revolted from the national organization and formed separate organizations. (652.)

Mr. JORGAN says that the workers in some branches of the pottery industry belong to labor organizations, while the workers in other branches do not. The action of the national organization of pottery workers in agreeing to a reduction of wages made labor organizations somewhat unpopular in Trenton.

After the organization of potters in Trenton withdrew from the national organization it sought affiliation with the central organization in Trenton, but was refused admission to that organization because of the rules of the national body, which prevented local organizations from affiliating with central organizations

CLX INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

unless the local organizations were members of the national association. The central organization was in sympathy with the local branch, and would have been glad to admit it if the rules had permitted.

The objects of the organizations of pottery workers in Trenton are to secure fair wages, uniformity of prices, fair dealings with the manufacturers, and the promotion of the prosperity of the pottery industry. If a man has a dispute with his employer he notifies the organization. A committee is appointed to settle the difference, and if the committee is unable to settle it the matter is put into the hands of the executive committee. That committee then declares that bench struck, and the member having the grievance is on strike, and is entitled to strike pay from the union. It is impossible to say what the union would do in case an employer attempted to fill the bench with other labor, as there has never been a case of that kind. (645, 647, 648.)

2. *Jiggermen and Dishmakers' Union.*—Mr. CLAYTON says that about eight-tenths of the jiggermen and dishmakers of Trenton are members of the Jiggermen and Dishmakers' Union, and that the operatives employed in other branches of the industry are becoming affiliated with this union. "More than 70 per cent of the operatives and their helpers who produce general earthenware are members of this branch, and fully 80 per cent of the total output of a general-ware pottery is produced by this branch of operatives."¹

The Jiggermen and Dishmakers' Union is in harmonious affiliation with other labor organizations in Trenton, but not with the organization known as the National Brotherhood of Operative Potters. The reason for this is that the national organization agreed upon a scale of wages which would have materially reduced the wages paid to the workmen in the Trenton potteries. The scale of wages is lower in the West than in the East, and the agreement made by the national organization was an attempt to equalize wages by reducing the wages of the Eastern potters. Previous to the making of this agreement the Trenton potters sent delegates to the national convention. (636, 639, 642.)

D. Relations of employers and employees.—Mr. CLAYTON says that the relations between employees and employers in the pottery industry are amicable and cordial. The pottery employees believe rather in the conciliatory than in the arbitral method, and they have never found any indisposition whatever on the part of employers to meet with the men and discuss matters. (638, 642.)

Mr. CAMPBELL says that the labor employed in the manufacture of sanitary wares is organized labor, though nonunion men are not barred. The manufacturers recognize the union and frequently confer with representatives of the workmen. There has been no strike in the industry since 1890, and the strike of that year was eventually settled by a joint committee of manufacturers and employees. In case of any difficulty arising in single potteries it is customary for the employees of the pottery to notify the owners. If the trouble is of such a character that it can not be settled satisfactorily by them, the matter is brought before the union and before the organization of employers. Committees are then appointed by both sides and these committees endeavor to adjust the difference by a series of compromises. (625, 626, 627.)

Mr. O'NEILL says that the pottery workers have always been glad to settle difficulties with employers through conference and compromise. (655.)

Mr. LAWRENCE says that the tile manufacturers have never had any difficulty whatever with their labor from the beginning of the industry and that they have never had a strike. The labor employed by the Trent Tile Company is nonunion labor. Unions always tend to create dissension. One man turns out more than another working on piecework, and this creates jealousy. Labor unions seem to be founded upon the poor workman and not upon the good workman. Labor organizations would be of advantage to employees in cases where employers were inclined to be unfair. Most of the persons employed by the Trent Tile Company have grown up in the shops of the company. (633, 634.)

E. General conditions of labor.—1. *Nationality.*—Mr. CLAYTON says that in general the workmen in the Trenton potteries are citizens. Quite a large number have come over from England. The workmen in pottery factories in other parts of the country also are very largely foreign born. (641.)

Mr. MORGAN says that about 98 per cent of the pottery workers who come to this country become naturalized. (647.)

Mr. CAMPBELL says that very few skilled pottery workers now come to this country from Europe. The employees who have served an apprenticeship in the works are preferred to any others. (626.)

¹ This statement seems to conflict with that of Mr. O'Neill. (See Testimony, pp. 652, 653.)

2. *Employment.*—Mr. BURGESS says that there is usually a shut-down of the potteries for a week at Christmas time and for a week in July for repairs. Outside of these shut-downs there has been steady work during the last 3 or 8 years. (606.)

Mr. CAMPBELL says that more men are employed now in the manufacture of sanitary ware than at any previous time. (626.)

3. *Machinery.*—Mr. MORGAN says that the pottery industry is peculiarly a handiwork industry. The labor is skilled labor and requires training. (643.)

Mr. CAMPBELL says very little machinery is used in the manufacture of sanitary wares, but that most of the skilled labor is done by hand. (626.)

4. *Wages.*—(a) *Generally.*—Mr. BURGESS says that, as a result of a conference between pottery manufacturers and pottery workmen, a standard uniform scale of wages was adopted which is in use throughout the West. This scale the Eastern workers refused to adopt, and wages in the East are somewhat higher than wages in the West. Wages in the pottery industry are mostly on the piecework basis. There is, however, a minimum rate of wages. It is reckoned, for instance, that a presser must have at least \$2.75 a day. The jiggerman, the dishmaker, and the mold maker must have at least \$3 a day. A jiggerman working on large machinery must have at least \$3.50 a day. The kiln man must have at least \$2 a day. These are the minimum rates of wages, and, through the system of piecework, the men usually make much more than these amounts. If any time work is done it is paid for at these minimum rates. There was a reduction of 12½ per cent in wages when the Wilson tariff law went into effect, but wages were restored when the Dingley law was enacted, so that now wages are substantially what they were in 1891 and 1892. A good many so-called fancy shapes have been introduced, however, and on these a higher rate of wages is paid, so that the actual wages of the workmen in the potteries are greater to-day than they have ever been since the establishment of the business. Wages are paid weekly in Trenton, semimonthly in the West.

Wages in this country are about 120 per cent higher than they are in England, and the English wages are the highest wages paid in Europe. The French come next, while the German are only about half the English wages. There is very little difference in the actual cost of living in this country and in England, provided the workmen live in the same way. As a matter of fact, however, they live better in this country. There is no doubt, however, that a workman can live according to the American style in this country and still save more than can an English workman.

In 1882 the rate of wages was to the materials used as 5½ to 4½, while in 1900 it was as 6½ to 3½. The labor cost, therefore, has proportionately increased.

Mr. Burgess submits a copy of the uniform wage scale adopted by the manufacturing and operative potters of the United States, to take effect May 1, 1900. (606, 607, 608, 613-624.)

Mr. MORGAN says that labor in the pottery industry receives much higher wages in this country than it does abroad. In France the wages average about \$8 per week; in Scotland a little over \$7; in England a trifle less; while the average in this country is \$11.43 per week. The same machinery is now used abroad as is used in this country. In cases in which women do the same work which is done by men in foreign countries their wages are only about half as much. The difference in wages here and abroad runs all through the industry. The workmen in this country can produce more than can the workmen in other countries, but the work is piecework and the workman in this country gets a higher rate per piece than does the foreign workman.

In 1900 a uniform wage scale was agreed upon by the national organization of pottery workers. This scale was practically the Western wage scale, and would have reduced the wages of the Trenton pottery workers. Upon its adoption, therefore, by the national organization, the Trenton association of jiggermen and dishmakers withdrew from the national organization. There is no justice in applying the Western scale to Eastern workers, because in the Western factories they were using more machines than were being used in the Eastern factories. The Eastern workers claimed that if they received the same rate of wages they were entitled to the same facilities. For the Eastern manufacturers to have put in the same facilities as the Western manufacturers had would have compelled them to tear out the inside of their potteries and rebuild. This they could not afford to do, and therefore matters went on as they were. The Western workers get rather higher wages than do the Eastern workers. They have the latest improved machinery and are able to turn out a larger amount of work. They do not make so fine a grade of goods or take so much pains to finish articles as do the Trenton workers.

Wages are now about what they were in 1890. Since that time there has been

CLXII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

a cut of 12½ per cent, and afterwards an increase of the same amount. (644, 645, 646, 647.)

Mr. O'NEILL, referring to the agreement by the National Brotherhood of Operative Potters to a uniform scale of wages, and to the fact that piece rates were higher in the Eastern than in the Western potteries, says that the difference in the wages which were paid in Western and in Eastern pottery factories was due to the fact that conditions were different. More machinery was used in the Western factories. A great many of the factories in Trenton were built in such a manner that it was practically impossible to furnish workers with the same facilities for the rapid turning out of goods as those which were furnished in the more modern factories in the Ohio Valley. The Eastern workers felt that if the same rate of wages were to prevail, the same conveniences should be given. The workers in Trenton stood in their own light for a good many years, and succeeded in keeping machinery out. They claimed that it was not possible to make as good work by machinery as by hand. It was found that the manufacturers of East Liverpool were paying 5½ cents a dozen to workers for the manufacture of goods for which the manufacturers in Trenton were paying 11 cents a dozen. The collecting of data and the comparing of prices in the two sections resulted in the adoption of the uniform wage scale by the national organization of potters.

A uniform wage scale is a sort of Utopian idea. Different methods of work prevail in different factories, and different styles of machinery are used. Nevertheless there are certain reasons why there should be a uniform wage scale. It is a protection both to employer and employee. A fair employer would be willing to pay as much as any other employer pays, and no fair workman would require his employer to pay more than was paid by his competitor. (652, 654.)

Mr. CLAYTON says that the wages paid to the workers in the potteries are much higher in this country than in England. In England more women are employed in the potteries than are employed in this country, and they are paid lower wages for the same work than the wages which are paid to men. The potters both in this country and in England work by the piece. Because of the difference in labor cost, protection should be given to the laborer in this country. The wages paid to the workers in the Trenton potteries are in general higher than those which were established by the national organization. Under the Wilson law wages of potters were very much reduced, but since the repeal of that law they have been increased.

The scale of wages under which the workmen in the potteries of Trenton work was fixed by conferences of employers and employees. (638, 639, 641, 642.)

(b) *Sanitary ware manufacture.*—Mr. CAMPBELL says that piecework prevails almost exclusively in the factories producing sanitary wares, and that there is a regular wage scale. Wages are paid weekly as a rule, and are paid in cash. Wages are uniform throughout the country. (625, 626.)

Mr. O'NEILL says that most pottery workers would rather be employed in a sanitary ware factory, as the rate of wages is higher and the percentage of men greater. (653.)

(c) *Tile manufacture.*—Mr. LAWSHE says that the average pay roll of the Trent Tile Company, which company employs 285 hands, 70 per cent of whom are boys and girls, is \$1,950 a week. The labor cost of the finished tile is about 70 per cent of the total cost. This estimate does not take into account the cost of the labor employed in producing the raw material. (632, 635.)

5. *Hours of labor.*—Mr. BURGESS says that the nominal hours of labor in the potteries are 10 hours per day, but that the different departments have different hours, and that, as a matter of fact, workmen generally work about 9 hours per day. They go to work at 7 in the morning and usually go home about 5 in the afternoon, with an hour at noon and 15 minutes for luncheon. In summer time a half holiday is given on Saturday and in winter the works are generally shut down at 4 o'clock on Saturday afternoon. (608, 611.)

Mr. MORGAN says that as a rule the pottery workers work 10 hours a day, except on Saturday, when they quit at 4 o'clock. The machinery stops at 6, and a man can not work after the machinery stops. Some of the potters work only 8 hours a day. Mr. Morgan does not know of any case when a jiggerman has been obliged to work more than 10 hours in a day. In England the hours of labor are somewhat shorter. The men do not go to work so early on Monday mornings and they quit somewhat earlier. (644, 648.)

Mr. CAMPBELL says that in the sanitary ware potteries 10 hours constitute a day's work and that there is no Sunday labor except what is necessary for the firing of the kilns. (636.)

6. *Loss by breakage.*—Mr. O'NEILL says that there is not as much breakage in the manufacture of pottery as formerly. The loss from breakage falls for the most part upon the employers. The workers are paid for every piece that goes

into the green room. In the manufacture of sanitary ware the regulation prevails to some extent that the workers suffer the loss from breakage; but the justice of that regulation has never been conceded by the workers, and the regulation has never been enforced by the employers. (653.)

7. *Apprenticeship.*—Mr. CAMPBELL says that a system of apprenticeship is in operation in the sanitary ware potteries. Apprentices serve for 5 years before obtaining full journeyman's wages. (656.)

8. *American and European workmen compared.*—Mr. BURGESS says that the English potter is put through a longer and more severe training than is the American potter. The result is that as a rule he turns out a better finished article. The machinery used in this country is, however, much more efficient than that used in England. (618.)

9. *American and European conditions compared.*—Mr. MORGAN says that the workers in the pottery industry live somewhat better in this country than they do in foreign countries. (647.)

Mr. CLAYTON says that the condition of workmen in the potteries in this country is very much superior to the condition of workmen in England. The educational opportunities for their children are very much better in this country, so far as the higher education is concerned. (641.)

10. *Employment of women.*—Mr. MORGAN says that about 20 per cent of the 6,000 people employed in the potteries in Trenton are women. About 150 women are employed in the clay department; in the finishing and decorating departments almost all the employees are women. In this country there are no instances in which men and women do the same kind of work, though in England and Scotland men and women are found doing the same work. (646.)

XIII. RATTAN TRADE.

A. Conditions of capital and business.—1. *Raw materials.*—Mr. LIONEL J. SALOMON, treasurer of the American Rattan Company, says that all rattan comes from the Malay Archipelago. There is no monopoly on the raw product. It is open to purchase by anyone. (720, 722.)

2. *Freight rates.*—Mr. SALOMON says that the freight on rattan goods from Germany to the United States is \$5 per ton, while from the United States to any section of Europe the rate is \$15 to \$30 per ton. Mr. Salomon says also that domestic freight rates on rattan goods are too high. Railroads are charging more for the transportation of rattan than they should be allowed to charge. There should be more than one classification. Rattan is used for many different purposes and much more labor is put into the manufacture of some rattan goods than is put into the manufacture of others, but the railroads classify all rattan goods indiscriminately as rattan. Freight rates are so high that it is impossible to sell rattan in parts of the country far distant from the manufactory. (730.)

Mr. C. W. SIEBERT, manager for Otto Gerdau, importer of rattan, says that rattan goods can be shipped from this country to Germany at about the same rate of freight as similar goods can be shipped from Germany to this country. Mr. Siebert submits a copy of a letter received from the managers of the Vogemann Line, quoting a rate of 25 shillings per ton on rattan from New York to Hamburg. (736, 737.)

Mr. JULIUS WARNECKE, of the Rattan and Cane Company, of New York, says that rattan goods can be shipped from this country to Europe for from \$5 to \$6 per ton. (737.)

3. *Import trade.*—Mr. SALOMON says that foreign importers of rattan goods simply maintain offices in this country. They secure orders, cable the orders abroad, and import goods to fill them. (721.)

Mr. SIEBERT says that every importer of chair cane or reeds in this country has an office and large store, each with a full complement of help, and carries a large stock here at all times. (736.)

4. *Tariff on rattan.*—Mr. SALOMON says that the 10 per cent duty imposed on rattan goods is entirely inadequate. There ought to be a duty of 25 or 30 per cent on some rattan goods. On others a duty of 15 to 20 per cent would be sufficient. Because of the inadequate protection given to the rattan industry the American Rattan Company now has a representative abroad looking for a factory site. If the company should transfer its business abroad it would simply conduct a small office in this country, land its goods in a storehouse, and ship them when called for. (721.)

Mr. SIEBERT says that the present duty of 10 per cent on rattan is quite sufficient to afford adequate protection to the rattan industry. (736.)

Mr. WARNECKE says that the imposition of the rates of duty on rattan suggested

by Mr. Salomon would entirely prohibit importations of chair canes and reeds and would be injurious both to the importers and to the smaller American manufacturers of rattan and reed products. The present rates of duty on rattan and reed afford ample protection to American manufacturers. (738.)

B. Conditions of labor.—1. *Machinery.*—Mr. SALOMON says that machinery is little used in the rattan industry, but that most of the labor is done by hand. Two-thirds of the employees of the American Rattan Company are full-grown men. The remaining one-third are boys and women. (732.)

2. *Wages.*—Mr. SALOMON says that the young men employed by the American Rattan Company to operate the machines used to split the rattan are paid from \$1.25 to \$1.50 per day; boys employed for this purpose receive anywhere from 75 cents to \$1 a day. After the rattan is split, it is introduced into machines, where it is put in shape suitable to go to the seater or to be woven into the different fabrics for which it may be intended. This work is done by expert women, who receive from \$1.35 to \$2.25 per day, according to the particular work which they perform. The bleaching is done entirely by manual labor, and the experienced workmen employed in this branch of the industry are paid from \$1.50 to \$2.50 per day. The American Rattan Company also employs a number of machinists, who are paid from \$2.75 to \$6 per day. In Germany, young men are paid only about 2 marks, or 50 cents per day. A great many of the men are paid 3 to 4 marks a day, and the women work for from 1½ to 2 marks a day. Machinists are paid from 4 to 8 marks a day. The German workers produce just as much work as do the American workers. (720.)

3. *Convict labor.*—Mr. SALOMON says that the convicts in the state prison at Frankfort, Ky., are employed in the manufacture of rattan goods. At the Joliet Penitentiary there is considerable manufacture of rattan articles. The Detroit House of Correction operates a chair factory. It has been estimated that at Joliet they use something like \$40,000 worth of rattan a year, the goods being bought exclusively in Germany, at prices which American manufacturers can not meet. As a general rule, the prison-made goods are sold at a cut rate, because nobody wants to buy such goods unless they can buy them at lower prices than those at which regularly made goods are sold. (721, 722.)

Mr. STEBERT says that the rattan used for manufacture in the state prison at Joliet is purchased exclusively from an American firm. (737.)

Mr. WARNECKE says that the only convict labor employed in connection with rattan goods is that employed in the manufacture of chairs; and that no such labor is employed in the manufacture of reeds or cane from rattan. (737.)

XIV. COTTON TRADE.

A. Development of cotton manufacture.—1. *Artistic development.*—Mr. LEAKE, a manufacturer of cotton and linen fabrics, says that the Centennial Exposition gave a great impetus to the finer kinds of textile manufacture in this country. Eighteen hundred and ninety, 1892, and 1893 marked a very high development of the manufacture. The general depression in business from 1894 to 1897 retarded it, because the demand was chiefly for the cheaper goods, and manufacturers followed the plan of offering what seemed to be big things for the money and of appearing to give more than they actually gave. This retarded artistic development. Since 1896 the development has again gone forward. (376.)

Mr. LINCOLN GODFREY, president of the Eddystone Manufacturing Company, says that there has been a very marked improvement in the artistic features of textile goods. Thirty years ago the machinery of the Eddystone Manufacturing Company was all adapted to producing patterns of one color. To-day more than half of the machinery will produce from eight up to fourteen colors with one revolution of the rollers over the cylinder. There has also been great improvement in the quality of the dyes. Aniline and aniline dyes have superseded logwood. They work equally well in the machines and make more satisfactory goods. All first-class establishments now manufacture printed cottons with colors which will last. American printed cottons are equal, so far as having fast colors are concerned, to any goods which are produced anywhere in the world. (474, 475.)

2. *Manufacture of lace curtains.*—Mr. LEAKE says that the lace curtain industry has been developed in Philadelphia within 6 or 8 years, and has had its principal development within 5 years. Mr. Leake knows of no lace curtain factories outside of Philadelphia except one at Wilkesbarre and one at Scranton. The manufacture is exclusively of Nottingham lace, and when it was established workers of the trade came over from Nottingham, England. The goods now produced seem to be equal, grade for grade, to those produced in England. (274.)

3. *New Bedford as a cotton manufacturing center.*—Hon. WILLIAM W. CRAPO, president of the Wamsutta and Acushnet Mills, says that for many years New Bedford was the leading whaling port of the world, but when oil was struck in Pennsylvania and gas came into use for lighting purposes the whaling industry died out, and the people of New Bedford turned their attention to cotton manufacture. The industry has grown until there are in operation to-day in New Bedford about 1,370,000 spindles, and from 23,000 to 24,000 looms. New Bedford has manufactured the finer goods almost exclusively from the beginning. The industry has been reasonably profitable. (535.)

Mr. ANDREW G. PIERCE, president of the New England Cotton Yarn Company, says that about \$20,000,000 is invested in New Bedford in the cotton industry. As a cotton manufacturing center the city has a certain advantage in the humidity of its atmosphere. The cotton industry has been so long established there that there have been gathered together employees who are perhaps better suited for the work than are those engaged in some other communities. The manufacture there is not carried beyond spinning and weaving. There is no finishing done. The city has a good water and sewerage system, and there is gas and electric lighting throughout the town. The school system is of a high standard, and the children of the operatives are educated in the schools. There are evening schools which are attended by the operatives. (541, 543, 545.)

4. *Fall River as a cotton manufacturing center.*—Mr. SIMEON B. CHASE, treasurer of the King Philip and Osborn Mills, says that Fall River is the leading print cloth manufacturing center in the country. A considerable variety of cotton goods is produced there, but the leading product is what is known as print cloths. Most of the product is also printed in Fall River. The chief advantage which Fall River has as a manufacturing center is its nearness to markets and its water communication. (555, 556.)

5. *Cotton pile fabrics.*—Mr. LEAKE says that there are 3 or 4 establishments manufacturing Turkish towels and similar pile fabrics in the neighborhood of Philadelphia, and perhaps about as many more in other parts of the country. These goods are made for the most part of cotton and linen, though sometimes of wool and worsted and sometimes of silk. (273.)

6. *Cotton manufacture in the South.*—Hon. WILLIAM F. DRAPER, president of the Draper Company, says that to-day the Draper Company is selling more cotton machinery in the South than it is selling in New England. The increase of cotton manufacture in the South has been more rapid than in the Northern States. There is no doubt that the improvements made in cotton machinery have assisted the development of cotton manufacture in the South. The Southern mills are new mills and have an advantage in having all the latest improvements. Some of the Northern mills are running along with machinery 10, 15, or even 20 years old, and cotton machinery is practically antiquated in 15 years. The fact that low wages are paid in the Southern factories has probably had something to do with the rapid development of cotton manufacturing in the South. The Southern manufacturers also have an advantage in getting cotton. The climate may be somewhat against them, but the general opinion is that the Southern cotton mill has on the whole a substantial advantage in the manufacture of coarse and medium goods. (465, 469.)

Mr. ROBERT T. DAVIS, president of the Stafford, Wampanoag and Algonquin Print Mills, says that a considerable number of cotton mills have been established in the South and there will probably be a material increase in the output of cotton goods. In that case New England cotton manufacturers will suffer, and the Southern manufacturers will suffer also for some years. The growth of the country, however, together with the extension of the foreign market, will finally give a fair business. Before very long the Southern manufacturers will be compelled to pay higher wages for labor and to give shorter hours. When that time comes New England can maintain her industries in competition. (591.)

Mr. LEAKE says that the competition of the South has put a stop to the manufacture of many lines of low and medium grade cotton goods in the vicinity of Philadelphia and goods of a higher grade have taken their place. "They have forced us a little higher up the scale; that is all." (280.) The bulk of the Southern output of cotton yarns is below twenties, though the forties would be a good dividing line between Southern and New England production. Most of the coarse yarns—forties and under—are made in the South. Some fairly good goods even above fifties are made there. The finer yarns, from forties to one hundred and fifties, come chiefly from New England. Above 100 and up to 150 the imported yarns contest the field, and above 150 the market is so small that it is left almost altogether to foreigners, except yarns for sewing cotton.

Mr. Leake has no fear that the Philadelphia weaving industry will be driven to

CLXVI INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

the South. Philadelphia people are thoroughly employed at better wages than ever. (280.)

Mr. CHASE says that Southern competition is much more effective than Northern competition, because the goods can be produced more cheaply in the South on account of the longer working hours and the lower wages. (555, 561.)

Mr. CHARLES L. LOVERING, treasurer of the Merrimac and other mills, says that there is an advantage in manufacturing cotton in the South, because fuel is cheaper, wages are lower, and the hours of labor per week are longer. Wages per day are about 30 per cent lower than the wages paid in the North. The price paid for weaving a certain given length of 40 picks is a trifle over half what is paid in the North. The hours of labor are 8 hours longer per week in Georgia than in Massachusetts. Exactly the same kind of machinery is used in the Southern mills as is used in the Northern mills. The looms are speeded not quite so high. The output per loom is from 5 per cent to 10 per cent less. Mills in Massachusetts are rather handicapped, because of the higher cost for labor and fuel, and the shorter hours of labor, in manufacturing goods for export, and that fact has led to the establishment of mills in the South. (529, 530.)

B. Conditions of capital and business.—1. *Merrimac Manufacturing Company.*—Mr. LOVERING states that the Merrimac Manufacturing Company was chartered in 1822. It manufactures cottons for printing. It also has a printing department with 21 machines in operation, and manufactures shirtings, calicoes and cotton toweling. The company has mills at Lowell, Mass., and at Huntsville, Ala. The Lowell mills have 144,000 spindles, 4,300 looms, and they employ 2,400 persons. The mill at Huntsville has 25,000 spindles, 848 looms, and employs 425 hands. The company is capitalized at \$2,750,000. (528, 529.)

2. *Massachusetts cotton mills.*—Mr. LOVERING states that the Massachusetts cotton mills were chartered in 1839. They manufacture shirtings from coarse yarns, cotton flannels, and denims. The mills have 126,000 spindles, 4,100 looms, and employ 2,200 hands. They are capitalized at \$1,800,000. (528, 529.)

3. *Whittington Manufacturing Company.*—Mr. LOVERING says that the Whittington Manufacturing Company was chartered in its present form in 1888, but that it grew out of an old corporation that was established in 1833. The company has 48,000 spindles and 1,680 looms in its mill. It employs 1,200 hands, and is capitalized at \$800,000. (528.)

4. *Massachusetts Cotton Mills in Georgia.*—Mr. LOVERING states that the Massachusetts Cotton Mills in Georgia were chartered in 1894, and have 51,624 spindles and 1,726 looms. There are about 1,000 persons on the pay roll and the capitalization is \$1,000,000. (528.)

5. *Eddystone Manufacturing Company.*—Mr. GODFREY says that the business of the Eddystone Manufacturing Company is the printing of cotton cloths. The company produces all grades of print-cotton fabrics from the lowest quality to the finest goods. Many of the designs used are staple designs which go on from year to year, but 90 per cent of the fancy patterns are changed each year. The company could reproduce foreign styles if that were deemed desirable. Its usual custom is, however, to make original patterns, following suggestions which are gotten from the foreign prints. The company manufactures about 100,000,000 yards of fabrics of various kinds per annum. Its business runs rather to the finer kinds of cotton goods, and therefore it gets its supply of gray cotton chiefly in New England, though it buys all over the country. It has at times imported gray cotton. The goods which it is able to get in New England are quite as satisfactory as those which can be obtained anywhere in the world. About 50 per cent of the materials that are used in the dyes are produced in America, and about 50 per cent are imported.

The company employs about 1,200 people, 75 per cent of whom are men, the number of employees having doubled in the last 25 or 30 years. About 30 per cent of the labor is skilled labor. Most of this skilled labor comes from foreign countries. (471, 472, 474, 475.)

6. *New England Cotton Yarn Company.*—(a) *Organization and business.*—Mr. KNOWLES, member of the executive committee of the New England Cotton Yarn Company, says that that company is a consolidation of nine corporations. One of the plants taken over has been closed since the formation of the company. It was a small concern and could not be economically run. The company manufactures cotton yarns exclusively. (546.)

(b) *Economies of combination.*—Mr. KNOWLES says that the main economies which have been secured through the formation of the New England Cotton Yarn Company have been in manufacture. The company is able to manufacture more cheaply than were the single mills. An effort has been made to run each mill somewhat on a class of work by itself, and that is where the main chance

to economize has been found. The administration is not materially different than was that of the separate mills, but the cost of administering the new company is 20 per cent less than that of administering the separate concerns. The company is able to buy supplies to better advantage than could the individual mills, though it may be that it can not buy any more cheaply than could a good-sized, well-conducted mill. On the whole, the mills can be handled together to better advantage than they could be handled separately. (546, 548.)

(c) *Effect of combination on wages and employment.*—Mr. KNOWLES says that since the formation of the New England Cotton Yarn Company wages have been increased 10 per cent. The majority of the laborers do piecework, but a good many are paid by the day. In addition to increasing wages, the company has run the mill on much fuller time than they were run by the individual companies, so that the increase in the amount of wages paid to labor is more than 10 per cent. The wages paid have amounted in fact to about 15 per cent more than they did before the concerns combined. (546, 549.)

(d) *Effect of combination on prices.*—Mr. KNOWLES says that the consolidation of the different companies in the New England Cotton Yarn Company has not resulted in any increase of prices. The increase in price has been due to the high price of cotton, the high price of labor, and to the high prices of supplies in general. (546.)

(e) *Effect of combination on sales methods.*—Mr. KNOWLES says that before the New England Cotton Yarn Company was formed the separate concerns marketed their products through commission houses and in a variety of ways. The new company sells its entire product through its own salesmen and sells directly to customers. Its products are consumed all over the country, and the company has agencies in Boston, New York, Albany, and Philadelphia. (546, 547.)

7. *Quality of American cottons.*—Mr. LOVERING says that the cotton goods made in this country are superior in quality to English cottons. They are made probably of better material, and are absolutely free from filling. The wearing quality is superior to that of the English cottons. (530.)

Mr. CRAPO says that very great advances have been made in the manufacture of cotton fabrics, and that the goods which are being produced in this country to-day are equal in texture, style, and finish to any that are produced in Europe. The exhibit of American cotton goods at the Paris Exposition was equal to that of any country. The machinery used in this country is as good, and the workmen are as ingenious and skillful as can be found anywhere. (530.)

8. *American and European methods of textile manufacture compared.*—Mr. LEAKE, comparing the methods and customs of manufacture in Europe and America, says that the tendency of American manufacturers is to produce large quantities of a given style and to produce at a correspondingly less cost per unit. The development is analogous to that in railroads, where we handle tons almost as cheaply as some of the Continental roads handle hundredweights. But in the production of small quantities of specialties, to satisfy a small market, European manufacturers are ahead of us. The world has been accustomed to look to them for these special grades of goods, and doubtless will continue to do so for some time. Any one market may use but very few of them, but the demand of the whole world makes it worth while for some one manufacturer to undertake them. Some fancy articles, like passementeries and very fine grades of silk brocates, may be made to order on a hand loom, and no subsequent piece of the same pattern may ever be produced. In work which approaches this character America can not compete. Mr. Leake sees no reason why America should not produce every other kind of textile fabric. (276.)

9. *Import trade.*—Mr. DRAPER says that competition from China and Japan in the manufacture of cotton goods does not at present amount to much. It is likely, however, to become a very serious matter. If the Japanese and Chinese, with the low-priced labor which is at their command, continue to manufacture cotton goods, the present rate of tariff on cottons will not be sufficient to keep the Japanese and Chinese goods out. (469.)

Mr. CRAPO says that the competition of foreign cottons is chiefly in the finer grades, in which the labor cost is high. The importations of fine goods, which enter into competition with the cottons made in New Bedford, amount to about \$42,000,000 annually. Mr. Crapo thinks that goods of American manufacture could gradually be substituted for these imported goods. (536, 537.)

Mr. PIERCE says that the English cotton manufacturers have an advantage over the American manufacturers in wages and in about everything else. They have great advantage in the cost of the structure and equipment of the mills as compared with Americans. (542.)

10. *Export trade.*—Mr. CRAPO says that our foreign trade in cottons has been a

growing and increasing trade, apart from the interruption caused by the war in China. The exports of cotton goods have amounted to \$30,000,000 annually. (536.)

Mr. LOVERING says that the mills with which he is connected have a large export trade in cottons, the principal markets being South America and Africa. Very large amounts have been shipped to China, but the Chinese war has interfered with that trade. In South America and China American cottons have to compete with similar goods from other countries, chiefly with English goods. (529, 530.)

Mr. Lovering says that the Chinese are manufacturing cotton goods to some extent, but that their goods have never interfered with well-made, well-constructed American goods. They have gone to parts of China where the people were willing to use an inferior article. Mr. Lovering does not think that the Chinese can produce as good goods as can be produced in this country. The cotton goods made in India are not as good as those made in England. The Japanese took something like 100,000 bales of cotton from this country last year, and it must be, therefore, that the cotton-manufacturing industry is rapidly growing in that country. Germany has the advantage of free machinery. It is Mr. Lovering's opinion, however, that notwithstanding the high cost of labor in this country, a great many goods are made here at as low a price as they are made in Germany with the low-priced labor of that country. (533, 534.)

Mr. GODFREY says that about 6 per cent of the goods manufactured by the Eddystone Manufacturing Company is exported. The company sells largely to Great Britain, Australia, and Canada, as well as to South America and Continental Europe. To a greater or less extent it sells almost all over the world. It has not a large trade in China. Lots of American cotton goods are being exported to China, but they are not of the class of goods which the Eddystone Manufacturing Company produces. The company has been working up its foreign trade for some time. It is only within the last 5 or 6 years, however, that it has increased to any considerable extent. The company has agents who are Americans working in Great Britain, pushing its products among the stores in the larger cities in that country. The goods are always introduced as American goods. The quality of the goods forms the entering wedge for building up trade; afterwards the trademark helps to sell the goods. The English market is open to manufacturers from all countries, and the Americans compete with the best talent from all over the world in that market. The American manufacturers of printed cotton are entering upon a period of very extended foreign business, which will grow if present conditions are continued. If there should be a reduced consumption in this country, so that they would have to slow down in manufacturing, the cost of production would go up, and they would be at an additional disadvantage in seeking foreign markets; but, if the home market continues to be secured to them, there is no reason why they should not enlarge their foreign trade. (472, 473, 478, 479.)

Mr. Godfrey says that the prices of the goods exported by his company are—everything taken into consideration—the same as the prices at which goods are sold in this country. The company is able to go abroad and sell the goods at the full prices which are obtained for them in the United States. (473, 475.)

Mr. DAVIS does not see how any considerable foreign trade in crude print cloths could be established. The cloths should be printed or bleached or put in some form such as would enable the trader to sell them. So far as Mr. Davis knows, no crude print cloths are exported. Reciprocity treaties giving concessions to other countries in respect to noncompeting articles in return for concessions made to us would help our export trade. (592.)

Mr. LEAKE says that there is some export trade in cotton-pile fabrics, but that relatively it is very small. (273.)

11. *Handling of raw cotton.*—Mr. LOVERING says that the ideal way to pack cotton is in round bales. The cotton fiber is not in any way injured by being baled in the round form in the American cotton bale, and from 35 to 50 per cent more cotton can be put in a car or steamship than can be done if the cotton is packed in square bales. The density is very much greater in the round bale. There is less danger from fire in the case of round bales, and the percentage of cotton lost is very much less when it is packed in round bales than when it is packed in square bales. The cotton is cleaner, too, because very poor coverings are put on the outside of the square bales. (581.)

12. *Sales methods.*—Mr. CHASE says that the bulk of the unfinished print cloths manufactured in Fall River is sold to the converters in various parts of the country, usually through brokers. Cloths in the finished state are consigned by many cotton manufacturers to commission houses to be sold and distributed to the general trade. The unfinished goods sold by brokers are usually sold at a very much smaller rate of commission than that which is paid to the commission house selling the finished cloths. (555.)

Mr. PIERCE says that the bulk of the cottons manufactured in New Bedford is sold direct to the purchasers. Some saving is made by selling direct. (543.)

Mr. LOVERING says that cotton manufacturers sell their goods for export to local houses in New York which do business in foreign markets. Goods for the domestic market are sold through commission houses in Boston and New York. The looms of the mills with which Mr. Lovering is connected run very largely on orders, which are taken by the commission houses. (529.)

13. *Competition.*—Mr. GODFREY says that there is no combination of the manufacturers of printed cottons in this country, although there is such a combination in England. Competition in this country has been built up by the protective tariff, and is very active. As the result of this competition there have been improvements in machinery, so that the output has been increased, while at the same time the quality of the goods has been improved. Through competition, also, prices have declined and goods are being sold now at one-third of the prices charged for them 30 years ago. (473.)

Mr. CHASE says that there was an attempt a year or two ago to form a consolidation of the mills engaged in the manufacture of print cloths in Fall River, but the consolidation did not succeed. There was a consolidation of the mills making cotton yarns, into which all of the mills in Fall River entered. (563, 564.)

14. *Prices.*—Mr. LOVERING says that the prices of cottons have increased 20 per cent during the last 2 years, and 35 per cent since 1888. The increase has been due to the fact that there have been 20 10 per cent advances in wages and to the increase in the cost of supplies. (534.)

15. *Relation of labor cost to cost of production.*—Mr. GODFREY says that in the lower grades of printed cotton goods the labor cost forms about 35 per cent of the total cost of production. In the fine goods the labor cost is about 70 per cent of the total cost. This refers only the labor employed in the printing of cotton. It does not take into consideration the labor that was employed in producing the cotton or in transporting it, or in manufacturing it into the gray goods. (476.)

16. *Effect of tariff legislation.*—Mr. GODFREY says that the effect of the protective tariff has been to develop very active home competition in the cotton-printing business, and that because of this the manufacturers have been forced to look for foreign markets. The reserving of the home market permits them to turn out a very large product. That naturally cheapens the cost, and through the cheapening of the cost they are in better shape to compete in foreign markets. When the duties on gray cotton were lower than they are to-day, the company imported more, but under present duties it secures its supply of cotton goods in this country. The only goods that it was possible to import were goods in which the cost of the labor was a large part of the cost of the product. It was only fine goods that were imported, the labor cost of which would be from 60 to 70 per cent of the total cost. The prices of the finished products average as low now as when the gray cotton was imported. (472, 473, 476.)

Mr. Godfrey says that if printed cotton goods were admitted free into this country the surplus products of foreign countries would be dumped upon this country with every depression in the market which occurred in those countries. The result would be disastrous to American manufacturers. The first thought of the printed cotton manufacturers would be how much it would be necessary to reduce wages in order to compete with the cheap foreign labor. Men who had been making \$10 a week would be cut down to \$5. There are many people in this country who like to buy exclusive styles made in foreign countries and who can afford to pay for that class of goods. It is goods of that character that make up a large part of the imports of printed goods to-day. Cotton goods for the use of the large majority of the people of the United States are sold now fully as low as goods of the same character are sold in foreign markets, and they are of superior durability, workmanship, and style. If the tariff were removed, the English manufacturer would have so much business that he would probably double his prices in this country at once. The prosperity which comes through the tariff on other products is reflected in the printed cotton industry. For instance, if the iron and steel interests were depressed, a large number of buyers of printed cottons would be thrown out of employment and the depression would be reflected immediately in that industry. (475, 476.)

Mr. CRAPO says that so far as fine grades of cotton goods are concerned, the cotton industry is dependent on the tariff. The labor cost in the production of finer fabrics is very much greater than the labor cost in the production of coarse and heavy fabrics. Because of this, a higher rate of duty is put on the finer grades of cottons than on the coarser goods. It does not follow, because the coarser grades of cottons are exported, that the tariff on them could be dispensed with. There would be times when there would be an overproduction abroad and a glut in the

CLXX INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

English market, and goods would be sent here for sale at prices ruinous to the industry in this country. With a moderate duty on the coarser fabrics, this danger can be avoided. The tariff does not, in any way, stand in the way of exportation of cottons. (535, 536.)

Mr. DAVIS says that if the tariff on cotton goods were repealed or reduced there would be danger of more foreign competition. There would be times when European manufacturers would send large quantities of surplus goods into this country and sell them for less than the cost of production, so as to enable themselves to preserve their home market and the profits on the goods which they would sell in their home market. (532, 533.)

Mr. PICKER says that if the tariff should be repealed or reduced, it would depress the cotton industry, and the manufacturers would be obliged to revise the wage rate in order to meet competition. Foreign competition in the coarser grades of cottons is, under the present tariff, practically cut off. Still it would not be safe to dispense with the tariff on the coarser cottons, because of the danger there would be that foreign manufacturers would send their surplus stock to this country, and that there would be an influx of goods here which would be disastrous. (542, 550.)

Mr. LOVERING says that the cotton manufacturers can get along without any tariff on cottons because they can now beat England in many markets. The English can not now make a drill of the same standard as that made by American manufacturers and compete with Americans in China. Mr. Lovering does not think that there would be any danger of the dumping of surplus stocks in this country by foreign manufacturers in case the tariff was removed. The reduction of the tariff would result in a reduction of wages, but labor could buy more for the same amount of money than it is able to buy now. (533, 534.)

Mr. JACKSON, secretary of the Slasher Tenders' Union of Fall River, says that there is too much competition in the cotton business to-day, and that this competition has been brought about by the tariff on cotton goods. The tariff gave the American market to American manufacturers, and as a result there were enormous profits in cotton manufacturing for a while. Because of the profits, capital was invested in the cotton industry, especially in the South, where special inducements were offered. (537.)

17. *Earnings of cotton mills.*—Mr. KNOWLES says that the dividends paid by the cotton manufacturing companies must have been greater in 1900 than they were in the two or three years previous. The earnings of the cotton mills as given in the statement issued by William C. Hawes, however, are misleading. The Acushnet Mills appear by Mr. Hawes's statement to have paid dividends of 16 and 20 per cent. That, however, is based on a capitalization of \$500,000; whereas the property is worth much more. The stock is at a premium. The mills paid only a moderate dividend, not more than 4 or 5 per cent when business was profitable, and built up the property out of the earnings. (547.)

Mr. DAVIS says that the great bulk of the cotton mill property of Fall River can be purchased below par. This goes to show that the profits in cotton manufacturing are only moderate. There is a great deal of wear and tear in the mills, and it is generally understood that a mill should be largely renovated in the course of 15 years. The total capitalization of the cotton mills in Fall River is about \$30,000,000, but all the mills have been under-capitalized. For instance the Union Mills started with a capital of \$175,000. At that time the mills had only 15,000 spindles. When the mills had 70,000 spindles and were worth, without doubt, \$1,000,000 the capitalization still was nominally only \$175,000. (550.)

Mr. CHASE says that the King Philip Mills have declared a dividend every year for the last 15 years. The dividends have not varied according to the degree of prosperity; but the mills have paid dividends when they did not make any money, and have not paid larger dividends when they made a great deal of money. Usually the dividend has been 6 per cent, although there was 1 or 2 years when 7 per cent was paid. (550.)

Mr. PICKER says that the Wamsutta Mills, for a long series of years, have paid 6 per cent dividends yearly. Some of the other mills have not paid as much, and some have paid more. Previous to 3 years ago some of the mills did not pay anything. During the last 2 or 3 years some have paid 8 per cent. (544.)

Mr. JACKSON says that it has previously been the custom for the cotton mills in Fall River to issue their returns quarterly. Now, however, quite a number are concealing the amount earned. In almost every case they will state the dividends declared, but they do not state the amount earned. As a general thing, the mills pay an average of about 6 per cent. In some cases, however, special dividends have been declared. Inside of 10 years one mill declared special dividends of over 100 per cent. It is fair to state that the owners claimed that in this case the capital stock did not represent anything like the actual value of the mill. That

explanation would not hold now, however, as the mill is capitalized at present at its full value. The capitalization has risen from \$500,000 to \$1,200,000. The increase of capitalization represents a surplus earned by the mill, outside of the regular dividends declared. When cotton mills are well managed and have competent men at the head of them they make money, and always have made money. There are mills in Fall River which are so badly managed that no matter how productive the labor might be, it would be almost impossible for them to earn dividends. The waste in some of the mills is shameful. Many of the mills undoubtedly make large profits through having a large stock of cotton on hand when there comes an advance in the price. (583, 584, 585, 586.)

18. *Condition of business.*—Mr. LOVERING says that cotton manufacture is not profitable at the present time in the North, and things are looking very serious for the Southern properties. The companies with which he is connected have so far succeeded in paying dividends of 6 per cent per annum. For 3 years previous to the middle of 1900, business was better than for the 3 years previous to that, but during the latter part of 1900 business was in a poor condition. The prosperity of cotton manufacturing is very largely dependent on the general prosperity of the country, but more dependent on the price of cotton. The present depression in the industry is due in large part to the high price of cotton, and the high price of cotton is due to the fact of there being too small a supply to meet the demand. It has not been possible to advance the price of finished cottons enough to cover the advance in the price of raw cotton. Cotton fabric is more readily disposed of at a reasonably low price than at anything like a high price. (530, 531.)

Mr. CRAPO, testifying in February, 1901, said that at that time there was an overproduction in cotton manufacture, which had slackened demand. The last 3 years have been prosperous years for the cotton industry, very much more prosperous than were the 3 years preceding. The prosperity has been due in a great measure to the greater confidence in the stability of our currency, and has been due also to the fact that there has been no agitation of the tariff during the last 2 or 3 years. (537.)

Mr. DAVIS, testifying in February, 1901, said that at that time the cotton manufacturers had an accumulation of goods on hand. Cotton goods were selling at 8 cents, which is less than the cost of manufacture. The depression in the industry was due to the fact that the business had been somewhat overdone. There are more spindles than are needed. (590, 591.)

Mr. CHASE says that there has been a decided improvement in conditions in the cotton industry in the last 3 years, as compared with the 3 years previous. This has been due mainly to the general prosperity of the country. The removal of the fear that the currency would be placed upon a false basis, and the apparent settlement for years to come of the tariff question, have given people confidence to go ahead. (557.)

Mr. PIERCE thinks that the present sluggishness of the cotton industry is due to the recent rise in the price of cotton, and that there will not be any betterment in the market until it is more clearly known what the next cotton crop is going to cost. The rise of the price of cotton has affected foreign manufacturers as well as those of this country. (542, 543.)

Mr. JACKSON, testifying in February, 1901, contended that there was money in cotton manufacturing with the prices of cotton and cloth which ruled at that time. He had come to this conclusion from calculating the price of cotton and the cost of manufacture. It is safe to assert that a yard of cotton goods can be made as cheaply in Massachusetts as anywhere in the world. The fact that \$40,000,000 of cotton goods were imported into this country last year must be due, Mr. Jackson thinks, to the fact that there are a number of people who want imported goods, simply because they are imported. (585, 586.)

C. Labor organizations.—1. *Carders' Association of Fall River.*—Mr. JAMES TANNREY, secretary of the Carders' Association of Fall River, says that that association has 1,200 members, about 1,000 of whom are women or girls. The members pay weekly dues, and the association pays a weekly allowance to members who are out of work through strikes, lockouts, accidents, or breakdowns. It also pays death claims. (579.)

2. *Weavers' Progressive Association of Fall River.*—Mr. WHITEHEAD, representative of the Weavers' Progressive Association, says that that association is a voluntary organization of weavers in the cotton mills of Fall River, with about 2,800 members, including both men and women. It includes among its members employees working in all the different mills in Fall River where weaving is carried on. The dues are 10 or 15 cents a week. The association pays a weekly allowance to members who are out of employment, and also pays a death benefit. The organization has had a healthy growth during the last few years. It is not an

CLXXII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

incorporated association. If it were incorporated, the by-laws would have to be approved by the Secretary of State, and it is possible that it would be necessary for the association to have provisions in its by-laws which the State would not feel disposed to sanction. (573, 574.)

3. *Fall River Mule Spinners' Association.*—Mr. O'DONNELL, secretary of the Fall River Mule Spinners' Association, says that that association has from 650 to 675 members. All the spinners operating spinning machines in Fall River belong to the union. The association pays a death benefit and also pays a weekly allowance to members who are out of employment, or who are disabled on account of accidents met with while following their ordinary occupation. The association is not a chartered organization. The State law compels incorporated associations to make annual statements of their financial condition, and for that reason it has not been thought wise to incorporate the Mule Spinners' Association. It is not necessary for the members to make any contracts with their employers, as the work, except in the case of a few concerns, is paid for at a regular list of prices and by the piecework system. (564, 565.)

4. *Slasher Tenders' Union of Fall River.*—Mr. JACKSON, secretary of the Slasher Tenders' Union of Fall River, says that that association has 158 members, all of whom are men. The tending of a slasher is looked upon as skilled labor, as it takes some little time for a man to become proficient in it. A slasher is a machine which prepares the yarn for a weaver. The Slasher Tenders' Union charges an admission fee, besides having weekly dues. It pays a weekly allowance to members who are out of employment through strikes, lockouts, breakdowns, or fires. It does not pay a death benefit, except in case a man is killed at his work. (581.)

5. *Calico Printers' Union.*—Mr. GODFREY says that the printers now employed by the Eddystone Manufacturing Company belong to the Calico Printers' Union. The organization is a very strong one, and the company's shop is a union shop so far as that particular branch of skilled labor is concerned. (477.)

6. *Union labels.*—Mr. O'DONNELL says that there is no union label used in the cotton industry, because there are so many different departments in a cotton mill. One department might be thoroughly organized while another might not be organized at all. (565.)

7. *Attitude of employers.*—Mr. DAVIS says that the attitude of the manufacturers in Fall River toward labor organizations is entirely friendly, and that he does not think that the representatives of labor have any fault to find with the way in which they are treated by the manufacturers. (591, 592.)

Mr. JACKSON says that there is never any difficulty nowadays in securing a conference with the manufacturers in Fall River. Since Mr. Jackson has been secretary of a labor organization he has never met with but one refusal on the part of manufacturers to confer, and in that case there was a conference in the end. (582.)

Mr. GODFREY says that, on the whole, the Eddystone Manufacturing Company would much prefer to have its labor unorganized, but it would not do anything to destroy any labor union; neither would it do anything to favor it. The attitude of the Printers' Union is entirely satisfactory, and its members have always shown themselves to be reasonable. If all organized labor acted in accordance with the same principles, the company would have no objection to it. (477.)

D. *Relations of employers and employees.*—Mr. GODFREY says that the Eddystone Manufacturing Company keeps in as close touch with its employees in every way as it possibly can. A liberal and progressive policy toward labor is an advantage to the business. The company observes in every detail the factory laws of Pennsylvania, the provisions, as a rule, being proper and fair. The company closes its workshops at 12 o'clock on Saturday throughout the year. It provides for its employees a library with reading rooms, an assembly room, and a room for games. These privileges are quite largely taken advantage of. The company has had one difficulty with its employees. That occurred in 1886, when the Knights of Labor undertook to force the company to employ none but union men. (477, 481, 482.)

Mr. PIERCE says that in January, 1898, there was a general reduction of wages throughout New England in the cotton mills. As a result, the employees struck, and the mills were shut down for 13 weeks. The strike did not include the yarn mills. At the end of 13 weeks the mills were started up and ran for nearly a year at the reduced rate of wages; then wages were advanced 10 per cent. Later on, there was another advance of 10 per cent. The employees lost 13 weeks' pay, and the manufacturers, so some of them thought, did not lose very much. They had a stock of goods on hand, and were able to get rid of about all of it before the mills opened again. At the present time the relations with labor are very harmonious. (543, 544.)

E. *Conditions of labor.*—1. *Generally.*—Mr. DAVIS says that some years ago the State board of health in Massachusetts instituted inquiries concerning the

health of mill operatives as compared with the health of other classes of the population. The investigations made showed that there was as small a proportion of deaths among the mill operatives in Fall River as among the people of any other class. Some of the operatives in Fall River own their own homes. It is a question as to how many who are able to own their own homes care to own property of that kind. The taxes are quite high in Fall River, and the operatives find it about as economical to rent as to own a house. Deposits in the savings banks are quite large, one of the large institutions in Fall River having something like \$3,000,000 or \$4,000,000 of deposits. (594, 595.)

Mr. PIERCE says that as a rule the operatives in the cotton mills in New Bedford are thrifty and frugal. Quite a good many own their own homes. Some of the corporations provide tenements for their employees. (544, 545.)

2. *Nationality.*—Mr. CHASE says that the workers employed in the Fall River cotton mills are largely French-Canadians, Irish, and English. A large proportion of the employees have lived in Fall River for some time. (556.)

Mr. PIERCE says that the operatives in the cotton mills of New Bedford come from all over the world. In the northern part of New Bedford a large percentage of the operatives are French-Canadians; in the southern part of the city there is a large percentage of Portuguese. When the mills were first established, 50 years ago, the operatives were mostly English. French-Canadians have begun to be employed within the last 25 years. At the beginning, all the members of the family would work in the mills, and when money enough was accumulated, all would return to Canada. Now the men establish themselves in New Bedford and become citizens. (542, 544.)

Mr. LOVERING says that the labor employed in Southern cotton mills is altogether white labor, with the exception of scrubbers. White and negro labor can not be worked together. (582.)

3. *Machinery.*—Mr. WHITEHEAD says that improved machinery enables operatives to turn off considerably more work than they turned off with the old machines. The quality of the work has also been improved through the introduction of improved machinery. (577.)

4. *Wages.*—Mr. CHASE says that the wages of cotton-mill employees in Fall River have increased within the last 3 years, the increase having been made upon request after conferences with representatives from the employees. Operatives are paid mostly by the piece and wages are paid weekly in cash. There are no company stores in Fall River. (557, 558, 559.)

Mr. LEAKE says that wages in his particular branch of manufacture have increased about 10 or 15 per cent since the depression of 1893, but that wages in other textile manufactures at Philadelphia have increased more. His goods are largely staples, and come into competition with those produced by lower-paid labor in other parts of the country. A considerable part of the textile manufactures of Philadelphia consist of high-grade novelties and specialties. These call for a high class of skilled labor, and the pay in them is larger. (273.)

Mr. GODFREY says that according to his recollection unskilled labor in the cotton industry is paid a half more in this country than in England, while the wages of skilled labor are 140 per cent higher in this country than abroad. The wages paid to labor in the continental countries of Europe are lower than are the wages which are paid in England. Most of the skilled labor is found in continental countries. Engravers and printers in this country make from \$26 to \$31 a week. In Europe engravers and printers are paid about \$11 to \$12.50 per week. The wages of skilled labor in this country have been gradually growing higher. (477, 478, 479, 480.)

Mr. WHITEHEAD says that very few of the weavers in cotton mills are employed by the day; probably 95 per cent are employed by the piece. They get the same rate of wages for overtime work that they get for day work. (575.)

Mr. TANSEY says that the minor work in the carding room in the cotton mills of Fall River is done by women and minors, who receive from \$3.65 to \$4.50 a week. The card strippers, who are men, receive from \$6.50 to \$7 a week; the tenders, who are also men, receive from \$6 to \$6.75 per week, and the card grinders get from \$9.25 to \$12.50 per week, according to the number of cards they have to look after. (579.)

Mr. O'DONNELL says that the wages of the mule spinners in the Fall River cotton mills differ to a certain extent because of the difference in the length of the machines. The wages of the mule spinners range from \$11.50 or \$12 up to about \$18 per week. The wages paid at the present time are exactly the same as the wages paid in 1892. Between 1892 and 1897 there were 2 reductions in wages, and there have been 3 advances since 1897. (571.)

Mr. O'Donnell says that the employees in cotton mills would prefer always a curtailment of production, and therefore a curtailment of employment, to a reduc-

CLXXIV INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

tion of wages; because, if the market is stagnant, the reduction of wages does not help matters, as it leads to a reduction of price. If goods are not in demand, production must be curtailed until a demand is created. (571.)

5. *Fines*.—Mr. WHITEHEAD says that the weavers are the only employees in cotton mills who are subject to fines. The system of fines has caused a good deal of dissatisfaction and in some cases has led to strikes. The weavers are opposed to fines on principle, and they do not think that the manufacturers should be sole judges of the fact whether a weaver should be fined or not. There is a law in Massachusetts providing that a weaver can not be fined unless he consents to it. The enactment of this law was brought about by the injustice and imposition that had been practiced upon the weavers in respect to fines by overseers and superintendents. Weavers were sometimes fined for matters entirely beyond their control. There is some fining now, even when the weavers do not consent, but not on a large scale. (576.)

6. *Hours of labor*.—Mr. WHITEHEAD says that if people knew what the conditions are under which the employees in cotton mills have to work, they would realize that there ought to be a shorter working day. Conditions are different from what they were 25 or 30 years ago. The speed of the machinery has been gradually increased, and operatives have to keep up with it. An operative is compelled to turn out so much work per week, and if the amount of work accomplished does not keep up to the point required the operative is discharged. The requirements made are excessive and unreasonable. The operative has no control over the machine, and it is liable to break down; but this is not accepted as any excuse. (578.)

7. *Employment of women*.—Mr. CHASE says that about half of the operatives in the cotton mills of Fall River are women and girls. The frame spinners, spoolers, warpers, and web drawers are nearly all women. The mule spinners are men. (581.)

8. *Sanitary conditions*.—Mr. O'DONNELI says that there has been a great deal of improvement in the sanitary conditions of the cotton mills, but that there is room for much more improvement. Ventilation in many of the mills is very defective. (572.)

9. *American and European conditions compared*.—Mr. JACKSON says that the weavers and spinners and slasher tenders in cotton mills are paid more in England for the work they do than they are paid in this country. Their weekly earnings are not so great, for the reason that they do not do as much work. As long as a man is employed, he is better off in England than he is in this country, and has more of the comforts of life. When he loses his position he is not so well off in England as in the United States, because he has not as good an opportunity of getting other employment. The workers in England do not make a point of saving as do the workers in this country. They enjoy life more. Mr. Jackson thinks that a majority of the mill operatives in Fall River could not stand 2 weeks' vacation without suffering or without assistance from labor organizations. (586, 587.)

XV. COTTON MACHINERY TRADE.

A. Development of cotton machinery manufacture.—1. *Development of the spindle*.—Hon. WILLIAM F. DRAPER, president of the Draper Company, of Hopedale, Mass., says that his company has given special attention to the development of the spindle. The improvements in spinning made by the firm since 1870 have made it possible to double the production of cotton yarn with the same machinery, the same labor, and substantially the same power. In 1870, the limit of speed of the spindle was 5,000 revolutions a minute. An invention made in 1871 enabled the spindles to be run at about 7,500 revolutions a minute. A still further improvement made in 1878 gave to the spindle the power of unlimited speed, and the speed of the spindle is now limited by what the other parts of the machinery will stand rather than by what the spindle itself will stand. There are probably in this country, now, 15,000,000 so-called ring spindles. The cost of the machines per spindle is about \$4. That makes \$60,000,000 invested in spinning frames. This investment of \$60,000,000 is doing to-day what it would have required an investment of \$120,000,000 to do under the old method. The new spindles are not applicable to the mule. The very finest yarn is spun on mules. (460, 461, 470.)

2. *Development of the loom*.—Mr. DRAPER says that extensive improvements have been made in looms, and that a new style loom is now being introduced which will enable a weaver on ordinary plain goods to run at least twice as many looms as he has been able to run in the past. Taking print cloths as the standard, a weaver in Italy can run from 1 to 2 looms; in England, from 2 to 4; in the United States, with the best looms made previous to the introduction of the very latest improvements, from 6 to 8 looms. With the most improved style of loom which

is now being introduced by the Draper Company, which is the Northrup loom, a weaver can run from 16 to 20 looms, and produce as much cloth per loom, and cloth of as good quality, as is produced running the smaller number of looms of the old pattern. The Northrup loom automatically places the bobbin in the shuttle. On other looms this has to be done by hand by the weaver. Another improvement embodied in the Northrup loom is what is called a warp-stop motion, which stops the loom whenever a warp thread breaks, thus preventing bad places in the cloth. Altogether, it is easier for a weaver to run 16 Northrup looms than to run 8 of the ordinary kind. There has been a comparatively great demand for these looms, and during the past year the Draper Company has turned out 2,000 per month. It will be necessary for cotton manufacturers who desire to make money to equip their factories with these looms. The company spent 7 years experimenting on the loom, and spent several hundred thousand dollars in experiments before one suited for practical use was produced.

Foreign manufacturers can obtain looms of this pattern either by ordering the machines in this country or by purchasing the patents taken out abroad. The shops in France, Switzerland, and Austria are beginning to build these looms. The company has held back from introducing the patents abroad because it was felt that a complete introduction in this country first was desirable.

It will be possible to use the Northrup loom in the weaving of woollen goods. So far the looms sold have been adapted only up to 5 harnesses. There is no reason, however, why they should not be adapted to a larger number of harnesses or even to Jacquard weaving.

There had been no radical improvements in ordinary power looms for more than 50 years previous to making the improvements embodied in the Northrup loom. (461, 462, 463, 470.)

B. Conditions of capital and business.—1. *Draper Company.*—Mr. DRAPER says that the Draper Company is the final outgrowth of a business which was established about 1820. The founder of the business invented what is called a temple for weaving, which is a device which keeps the cloth extended during the process of weaving. In 1865 the company employed only 50 hands, in 1896 it employed 1,200 hands, to-day the employees number 3,000. A great many of the employees have been with the company for a good many years. Substantially all the old employees who are living are still employed by the company. The company has never had a general labor difficulty. With the exception of a difficulty which arose between one of the company's contractors and his men there has never been a labor difficulty involving over 20 men. The labor in the foundry is organized. The employees are almost entirely men, only 10 women being employed. Few if any boys under 16 are employed.

The company manufactures looms, spindles, and the running parts of frames; twistors, spoolers, warpers, reels, and various other kinds of machinery used in the manufacture of cotton cloth. The machinery is sold direct from the home office through agents. The company sells probably from 10 per cent to 20 per cent of the cotton machinery sold in the country. (460, 463, 464, 465.)

2. *Competition.*—Mr. DRAPER says that there are a large number of concerns in this country manufacturing cotton machinery. These concerns are, for the most part, competitive. The Draper Company, in the great bulk of its business, is protected by patents, however. There was an effort a year or more ago to form a combination of the manufacturers of cotton machinery, but the effort failed. One reason for the failure was that the individual manufacturers had a certain pride in their establishments, and feared lest their shops might be closed if a combination were effected. Another reason why the combination failed was the general fear on the part of manufacturers that the business, being one which requires a great deal of detailed knowledge in its management, would not be so well conducted if interests were combined. If a sufficiently good management could be obtained, it is probable that business could be done more cheaply under a combination than when done under individual management. A dozen shops that are making a dozen different kinds of machinery could be so changed that each one of the dozen would make only one kind of machinery. In this way considerable economy could be effected. On the other hand, however, there is difficulty in getting men with sufficient ability and sufficient technical knowledge to manage such an extensive business as that which would be done by a company which was a combination of all the various interests. (467, 468.)

3. *Prices.*—Mr. SIMEON B. CHASE, treasurer of the King Philip Cotton Mills, says that the price of cotton machinery is somewhat higher now than it has been in recent years. This is due to the fact that there has been more demand for it, and that the cost of the raw materials is greater. (558.)

4. *Import trade.*—Mr. DRAPER says that more or less English cotton machinery

is now imported because of the low prices of that machinery. American manufacturers would prefer American-built machinery to English machinery if they could get it for the same price. So far as all ordinary cotton-manufacturing machines are concerned, American machines are in every way as good as English machines and, as a rule, better. The ordinary cotton mill can supply itself fully in the United States, and get a better outfit of machinery than it would if it bought its machinery in England. Very little improvement in cotton machinery is made in England. The great improvements of the last quarter of a century have substantially all been made in this country, and have been slowly adopted in England. As far as the quality of the work is concerned, American mechanics do better work than do English mechanics. The machinists' tools used in the shops in this country are better than those used in English shops. Wages paid in English shops, however, are materially lower than the wages paid in this country, and therefore English machinery can be produced at a lower cost. (466, 467.)

Mr. CHASE says that both American and foreign machinery is used largely in cotton mills. For the last few years, however, there has been very much less foreign machinery imported. When new machinery has been put in, there has been more American machinery put in than was formerly the case. There has been much improvement in some directions in American machinery, and the best American makes of most machinery are as good, and in some cases better, than foreign makes. (557, 558.)

Mr. KNOWLES, member of the executive committee of the New England Cotton Yarn Company, says that a large proportion of the machinery used in the cotton mills with which he is connected is English machinery. At the time that the mills were established, English machinery was considered better than American, though probably it was not so cheap. A large part of the machinery which would have been imported at the time the mills were built is now made materially better in this country than in England, and if the mills were to be equipped to-day, it would probably be with American machinery. (548.)

5. *Export trade.*—Mr. DRAPER says that the Draper Company is as a rule not selling any goods other than samples abroad. It has had an order for some 800 or 1,000 looms of the improved type from Japan. This order was given because of the special features possessed by these looms. The Japanese buyers were in doubt, however, whether the labor-saving feature would be of much account to them because of the cheapness of labor in Japan. American machinery is not exported because it costs more than foreign machinery, the greater cost being due to the higher wages paid to labor. Substantially 40 per cent of the cost of the machinery is labor cost. That includes only the labor actually employed in the manufacture of the machinery. It does not include salaries. There does not seem to be any probability that American cotton machinery will be sold in the immediate future in foreign markets in competition with the cotton machinery manufactured in England. (467, 468.)

6. *Effect of tariff legislation.*—Mr. DRAPER says that if the tariff on cotton machinery were reduced there would be either a corresponding reduction in wages or a corresponding increase in importations of foreign cotton machinery and a decrease of American production. (467.)

Mr. ROBERT T. DAVIS, president of the Stafford, Wampanoag and Algonquin Print Mills, says that he does not believe that it would be for the advantage of the manufacturers of cotton, in the long run, to have the duties on cotton machinery reduced or removed. Cotton machinery equal to that made in England is now made in this country, and there has been a constantly increasing use of American machinery. The difference in price between English and American machinery is not very great. Mr. Davis has been informed that the labor cost of machinery in England is just about one-half of the labor cost of similar machinery in this country. That being the case it would be disastrous to the manufacturers of cotton machinery in this country to have the tariff on cotton machinery removed. (503, 504.)

Mr. KNOWLES, member of the executive committee of the New England Cotton Yarn Company, thinks that it is doubtful if the cotton manufacturers would be better off in the end if the duties on cotton machinery were reduced or repealed. They would be better off to be protected on their own product even if the first cost of the mills were a little higher. If the tariff on machinery were reduced it would naturally affect the labor employed in the production of the machines. It is not likely that the cotton manufacturers would feel any disadvantage through that, but if the policy of tariff reduction were applied generally to mechanics the cotton industry would certainly be affected. (548.)

Hon. WILLIAM W. CRAPO, president of the Wamutta and Acushnet Cotton Mills, says that a reduction of the tariff on cotton machinery is not called for. There has been a steady improvement in American machinery, and the amount

of machinery which is now bought abroad, in comparison with what is made at home, is so small that it seems unwise to endanger the welfare of the shops in this country which are engaged in making cotton machinery. (537.)

Mr. CHARLES L. LOVERING, treasurer of the Merrimac and other cotton mills, says that he would like to have the tariff revised. He would like to be able to get cotton machinery at lower prices. The manufacturers of cotton are handicapped by the high cost of machinery. The English manufacturer can build a mill for one-third of what it costs the American manufacturer. The machinery builders of this country, under the protection which they have, have been enabled to combine, and the prices charged for machinery are uniform. (533.)

C. Conditions of labor.—Wages.—Mr. DRAPER says that a great deal of the labor in the manufacture of cotton machinery is done by the piece, both in England and in this country, and piece prices there are substantially lower than they are here. Some years ago a comparison between the wages paid by the Draper Company and the wages paid in a cotton machinery factory in Lancashire, England, was made, and it was found that the Draper Company was paying a trifle more than double the amount for piecework which the English manufacturer was paying. The average of the wages paid by the Draper Company was \$12 a week, while the average of the wages paid in the shops in England was 1*s*. This comparison was made 3 or 4 years ago, but it is probable that conditions to-day are very much the same. (466, 467.)

XVI. WOOLEN TRADE.

A. Conditions of capital and business.—1. American Woolen Company—Organization and capitalization.—Mr. WILLIAM M. WOOD, treasurer of the American Woolen Company, says that that company manufactures all varieties of woolen goods, except ladies' dress goods and perhaps the very cheapest shoddy goods. The company also spins worsted yarns, but does not manufacture any knit goods. It was formed by the combination of 26 corporations. The owners of the larger companies which entered into the combination came together and associated with themselves other companies, and then formed the organization. Afterwards they bought in some other plants. The company is potent in the woolen business, but it does not possess a monopoly. On the contrary, there is the liveliest kind of competition in the industry. The authorized capital of the company is \$85,000,000, of which \$30,000,000 is 7 per cent cumulative preferred stock and \$40,000,000 is common stock. Of this there has been issued \$30,000,000 of preferred and \$39,501,100 of common stock. The large manufacturers came together and determined upon the fair valuation of the buildings and machinery taken over.

The mill buildings contain 5,180,065 square feet of floor space; there are 5,410 looms, 298,980 spindles, 541 sets of cards, and 186 combs. The board of directors consist partly of men who were in the boards of the constituent companies and partly of financial men. Mr. Wood gives a list of the officers of the company. (513, 514, 516, 517.)

2. Advantages of combination.—Mr. WOOD says that numerous advantages have been secured through consolidation. The selling of goods direct has been a great feature in economizing. There has also been an advantage gained because of the facility with which different managers may compare notes in respect to the running of their various departments. As a result of this, the plants have been run better. By the centralization of business the company has been able to buy its supplies more economically. Economies have also been realized through the fact that it is possible to transfer materials from one mill to another, so that when one mill can not use its waste product, the product can be sent to another mill and used there. There has also been a great saving in freights through combination. (514.)

3. Effect of combination on employment.—Mr. WOOD says that since the formation of the American Woolen Company there has been an increase in the number of employees. The average number of employees at the time of the organization of the company was 15,300. Now, the employees number 17,108. The reason for the increase in the number of employees is that the combination has been able to command more business through the reduced cost of manufacture. Goods are sold to jobbers and to manufacturing clothiers. No branch houses are maintained, but the goods are shipped directly from the mills to the buyers. A large number of travelling salesmen are employed.

The company has shut down one plant, entirely dismantling it. The plant was antiquated and located in an undesirable place for woolen manufacturing. The machinery was transferred to other mills, so that the capacity of the dismantled

CLXXVIII INDUSTRIAL COMMISSION;—MANUFACTURES AND BUSINESS.

mill was not lost. It had been closed for some time, and the employees had disappeared. (514, 518, 520.)

4. *Effect of combination on wages.*—Mr. WOOD says that since the formation of the American Woolen Company there has been an average increase in wages of 10 per cent, and the company is to-day paying the highest wages ever paid in this country in woolen manufacturing. When the company was organized the payroll amounted to \$109,696.18 per week. Now it amounts to \$141,982.86 per week. (514, 520.)

5. *Production and consumption of wool.*—Mr. JUSTICE, a wool merchant of Philadelphia, says that about 500,000,000 pounds of wool is consumed in the United States every year. Since each sheep produces between eight and nine pounds, it would take probably 60,000,000 sheep, or 20,000,000 more than we have now and 10,000,000 more than we had in 1884, to supply our present demand.

Referring to the fact that the per capita consumption of wool in the United States has fallen from 9.07 pounds in 1890 to 6.7 pounds in 1900, Mr. Justice says that this fact is not due in any way to the protective tariff, because a similar falling off in consumption has taken place all over the world. He bases this conclusion on the decrease of wool production in the great wool-exporting countries, Argentina, Australasia, and the Cape of Good Hope. In 1892 these countries exported 2,540,000 bales of wool. In 1895 their exports had risen to 2,780,000 bales. In 1899 the product had fallen to 2,530,000 bales. This is less than was produced in 1892, although the population of the wool-consuming countries has increased.

Mr. Justice says that one great difficulty in increasing the wool product of the United States is that the farmers find it more profitable to sell the lambs for slaughter than to keep them for wool. He adds: "The wool clip of the Southern Hemisphere, taking the whole of it, is decreasing because the animals that are held for wool are decreasing. They are being fattened for market." Elsewhere he says, however: "Owing to the great stimulus imparted to the frozen-meat-export industry in the Argentine Republic by the perfection of refrigerating methods and by the quick perception of the possibility of profitable expansion of the business, the flocks in that country have increased until their annual clip is now estimated at one-fifth of the entire production of the world."

Mr. Justice says that the bulk of the wool clip of the United States comes from Merino sheep. They make very good mutton, but not so good as the half-breeds produced by crossing English rams on Merino flocks. These half-breeds are the best mutton sheep, and they produce a medium grade of wool, known as half-blood merino. (370-372, 374, 376, 388.)

6. *Importations of wool.*—Mr. JUSTICE, when testifying in December, 1900, did not think that the American wool market was yet free from the wool which was imported in the last months of the Wilson law in anticipation of the duties of the Dingley act. He presents an estimate of the amount of wool on hand in the country at the beginning of each year, being 894,000,000 pounds in 1897, 795,000,000 in 1898, 762,000,000 in 1899, 590,000,000 in 1900, and 479,000,000 in 1901. The annual consumption he gives as 460,000,000 pounds for 1897, 400,000,000 for 1898, 550,000,000 for 1899, and 525,000,000 for 1900. The large stocks of imported wool on hand have, he thinks, hindered the American wool producer from realizing the full benefit of the existing tariff. There was no excessive importation of cloth in anticipation of the Dingley law, because the use of a particular cloth is a matter of fashion, and it would be unsafe and unprofitable to lay in a large supply. (382, 383.)

Mr. WOOD, who testified in February, 1901, thought that at that time the wool which had been imported previous to the enactment of the Dingley law had been about absorbed. The large importations, however, had, in his judgment, delayed the consumption of domestic wool, so that there was a certain amount of wool in the country that probably would not have been here except for the large importations. (519.)

7. *Quality of American wools.*—Mr. WOOD says that the wool produced in this country is superior to foreign wools in some respects. For some purposes the foreign wool is preferable, and in the blending of certain fabrics for which there is demand it is necessary to use foreign wools. (516.)

8. *Skirted wools.*—Mr. JUSTICE says that skirted wools are those which have been improved by removing the least valuable parts of the fleece, such as the leg and belly pieces. The Dingley tariff provides that wool which has been sorted or increased in value by the rejection of any part of the original fleece shall pay twice the duty to which such wool would otherwise be subjected; provided, however, that skirted wool as imported in 1890 is excepted. Though skirting was not extensively practiced before 1890, the importers were able to secure evidence that it was actually practiced in Argentina in that year, and many Argentine wools so prepared for market are admitted on payment of a single duty. On account of the greater average length of staple, many manufacturers prefer these skirted

wools to the unskirted domestic. They require no sorting and are often used just as they are received in the original bale. No class of American wool can be used without sorting. (391.)

9. *American and English methods of manufacture compared.*—Mr. STEEL, a worsted and woolen manufacturer, says that in America these manufactures are carried on by single establishments, from the wool to the dyed and finished cloth. In England each separate process—the combing, the spinning, the weaving, the dyeing and finishing—is made a separate business. He believes that one element of cheapness connected with manufacturing in England is to be found in this separation of businesses. He thinks it is a more economical method than the American. (247.)

10. *Woolen machinery.*—Mr. STEEL says that the great bulk of the machinery used in the manufacture of woollens has to be imported. Some of the machines can be bought in this country, but probably not over 15 per cent of the equipment of a mill. The machines are generally of foreign invention, and the foreign makers have a monopoly of the building of them. Mr. Steel thinks that they are probably able to build them more economically. (246.)

11. *Use of shoddy.*—Mr. JUSTICE declares that the use of shoddy in the United States was never so great before the Wilson tariff act was passed as it has been since. Under that law, our markets were flooded with the products of foreign manufacturers and our mills were shut up. Those which survived had to make their woolen cloth with a large percentage of cotton and shoddy. Mr. Justice presents statistics of the importation of shoddy, noils, waste, etc., showing that during 1891, 1892, and 1893, under the McKinley law, the importation of these materials ranged from 215,000 to 322,000 pounds a year; during 1895, under the Wilson law, they were over 20,000,000 pounds, and during 1896 over 17,000,000. In 1897, when a tariff on all woolen materials was expected, and when it was desired, therefore, to lay in a stock for several years, the importations rose to nearly 45,000,000 pounds. During 1898, 1899, and 1900, under the Dingley law, the importations ran from 223,000 to 500,000 pounds. (376.)

Mr. WOOD says that a great volume and variety of woolen goods are now being made and there are more substitutes for wool used than ever before on account of this increased volume and variety. The increased use of substitutes has been particularly noticeable during the last year, since the great rise in wool. It is not due to the Dingley law so much as to the speculation abroad in wool. It is due also to the popular demand for cheap goods. Cotton is used more than ever before, and domestic wool waste and shoddies are also used. Shoddy is wool that has been worked one or more times before. Commercially there is no difference between shoddy and wool extracts, although there is a difference in preparing the stock. Foreign shoddies are not now imported. The substitutes are mixed in with the wool in the spinning or carding, and in some instances before carding. Often in overcoating a cotton warp is used, and there are also cotton-mixed cassimeres where the cotton is mixed in so that it can hardly be distinguished with the naked eye, though it could be discovered by chemical analysis. There is a method by which wool can be wound around a cotton core so that the yarn is hardly discernible from the real wool yarn, but the American Woolen Company does not make use of that method. It is used in a small way by knitters.

In some cases the use of cotton gives a better finished cloth, and, considering the price of the cloth, its use is an advantage. Cloth made of shoddy would not have the durability of cloth made of pure wool. Goods in which cotton is used are more durable than those in which shoddy is used. In general, the coloring in goods made of wool substitutes is not so satisfactory as the coloring in pure woollens. Goods in which shoddy is used are in general use, and the use of shoddy is on the whole a benefit to the public, because a very satisfactory piece of cloth can be bought for very much less money than that for which cloth made entirely of wool could be bought. There has been great improvement in the methods in which waste products are utilized. The higher grades of cloth are pure wool. There would be no occasion to introduce shoddy into very fine goods except perhaps for backing purposes. A very small percentage of shoddy is used in medium-priced goods. Substitutes for wool are used to greater perfection abroad than they are in this country.

Cloths containing shoddy are sold on the market for what they are. (515, 517, 518, 519, 520.)

Mr. STEEL states that each class of goods is made in England in a district of its own, and that there is one district almost entirely devoted to the manufacture of shoddy or, as it is called there, mungo. It is true that shoddy is used in making very good articles. Mr. Steel understands that "in Germany, where they make the finest broadcloths, they can not give them the proper finish without the use of

CLXXX INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

a certain proportion of what they call mungo. It gives a higher luster, a higher finish, to the goods." (240.)

12. *Quality of American woolens.*—Mr. WOOD says that the worsteds manufactured by the American Woolen Company are superior to the Bradford goods. There is no reason for importing foreign woolens. Those manufactured in this country are quite equal to the foreign goods, although there are some very expensive foreign goods, into which more labor is put than is put into any goods in this country, which are superior to American products. Those, however, are exceptional goods. American kerseys are superior to foreign kerseys. The clay diagonals made in this country are more honest than the foreign goods, and there are no clay diagonals made anywhere which are superior to some made in this country. The public is beginning to appreciate the quality of American-made woolens.

In the dyeing of woolens there has never been a higher degree of success than now. Each dyer, of course, has his own methods, though practically the same formula is used in this country as is used abroad. The manufacturers here avail themselves of the most desirable dyestuffs, whether manufactured in this country or elsewhere. (515, 517, 519.)

13. *Prices.*—Mr. WOOD says that cloth was never made so cheaply under protected wool as it is being made to-day. People are paying more for the same goods now, however, than they did under free wool, as the manufacturers are paying more for wool than they did then. (516.)

Mr. STEEL, who has had experience both in England and in the United States, says that the prices of woollen goods are considerably higher in this country than in England. "The raw material carries a duty, and of course there are the higher wages and the greater expense generally attendant upon carrying on the mill. The general expenses, cost of plant, and all that, are very much higher here than in England." The difference in price is not always as great as the tariff. This is especially true of the commoner class of goods, partly because of the competition among American manufacturers, partly because they require less skill, and partly because these cheap goods "are well protected by the weight duty—the specific duty." (239.)

Mr. FOLWELL, a woollen manufacturer, says that prices are considerably higher now than under the Wilson tariff, because wool is higher. They are no higher in proportion to the cost of raw material. Perhaps they are rather lower than under the Harrison Administration, on account of the increase of competition and the larger scale of manufacture. (215, 217.)

14. *Export trade.*—Mr. WOOD says that there can be no export trade in woolens successfully built up until the manufacturers can buy raw materials as cheap as foreign manufacturers get them. In addition to having free wool or a rebate equal to the duty on all wool used, there would have to be sufficient protection on woollen manufactures to equalize the difference in wages and interest. In some instances woolens have been exported, but the attempt was largely experimental, and there has never been a successful export trade in woollen manufactures. (515.)

15. *Cancellation of orders.*—Mr. STEEL refers to the custom of the trade which permits the cancellation of orders as the principal difficulty in his business. Orders are not regarded as binding, and the cancellation of them leaves on the hands of the manufacturers quantities of goods which they have to sacrifice. (239.)

16. *Depression of business.*—Mr. FOLWELL, testifying in December, 1900, said that the woollen business was somewhat depressed at that time in consequence of a sharp decline in the price of wool. This had led all buyers to restrict their purchases to their immediate needs. When things were fairly settled, Mr. Folwell expected a good business again. (214.)

Mr. JUSTICE declares that American manufacturers never supplied so large a part of the demand of the American people for woollen goods as at present. Running full time, they can make in 12 months as many goods as the American people can consume in 15 months. They did run full from July, 1899, to July, 1900, employing more people and paying higher wages than ever before. They thus overstocked the market with woolens. (879.)

B. Tariff legislation.—1. *Effect of tariff on wool on production.*—Mr. JUSTICE declares that the wool product of the United States has never decreased except when there has been no tariff on wool, and that under protective tariffs it has increased faster than that of any other nation in the world. From 1873 to 1884 we had the highest tariff on wool that we have ever had—12½ cents a pound. The tariff law of 1888 reduced the duty to 10 cents a pound. The McKinley tariff fixed it at 11 cents. The Wilson tariff act of 1893 repealed it altogether. The Dingley law of 1897 fixed it again at 11 cents a pound. From 1873 to 1884, under the highest tariff, the wool clip of the United States increased 100 per cent. That of Australasia increased during the same period 64 per cent; that of Argentina, 85 per cent; that

of the Cape of Good Hope, 60 per cent. Mr. Justice characterizes all these countries as "free-trade countries," or countries which have no tariff to foster or stimulate the wool industry. In Great Britain during the same period the wool clip decreased 19 per cent. In 1880 there were about 40,500,000 sheep in the United States. By 1884 the number had increased some 25 per cent, to about 50,500,000. But the 10-cent duty under the law of 1883 was an inadequate protection. In 1888 the number had decreased to 41,500,000. As soon as Mr. Harrison was elected President, "it was confidently believed and asserted that adequate protection would be given to wool growing, and the McKinley law was the culmination of that promise," in that it raised the duty from 10 cents to 11 cents. The flocks increased to 47,000,000 head in 1893. Then the Wilson tariff act brought free wool, and sheep were fattened and sold to the butcher. In 1896 the flocks numbered only 36,500,000. Upon the election of McKinley, even before the Dingley act was passed, they began to increase again, and by 1900 they numbered 40,000,000. (372-374.)

Mr. Justice thinks that it would have been most unfortunate if the reciprocity treaty which was proposed between the United States and Argentina, reducing the duty on Argentine wool by one-fifth, had been confirmed. Our imports of wool from Argentina are larger than from any other country except British Australasia. The United States takes practically all the carpet wool produced in Argentina. The name of carpet wool is misleading, since a very large part of it is used in clothing and blankets; but the amount of this coarse wool produced in Argentina is rapidly decreasing. Only about 3 per cent of the Argentina wool clip is now carpet wool, and over 60 per cent of the wool brought from Argentina into the United States is of finer grade. Almost all the wool produced there is similar to our own product. With a reduction of one-fifth in the duty, we should soon import more wool, similar to that which we ourselves raise, from Argentina than from all other countries. While the wool production of the countries of the Southern Hemisphere, other than the River Plata countries, decreased 12½ per cent from 1895 to 1900, the wool exports from the River Plata increased 8½ per cent. Argentina has been for several years the largest buyer of fine and pedigree sheep in the world. She is going through the same course of development which New Mexico went through—in the replacement of sheep that produced coarse carpet wool with finer breeds.

As to the argument for a reciprocity duty, that our exports to Argentina, and particularly our exports of agricultural implements, would be greatly increased if we took her products on more favorable terms, Mr. Justice presents a statement showing that during the 3 years 1897, 1898, and 1899 only 7½ per cent of the exports of wool from Argentina went to the United States and 92½ per cent went to Europe, while 91½ per cent of the Argentine imports of agricultural implements came from the United States and only 8½ per cent from other countries. In 1897, when we took wool without duty, Argentina bought less than \$500,000 worth of agricultural machinery of us. In the 2 years 1898 and 1899, when wool came in under a duty of 11 cents, or, including carpet wool, perhaps on the average about 10 cents, we sold over \$3,000,000 worth of machinery to Argentina. (396-396.)

Mr. Justice says that wool can not be produced in the United States, where sheep have to be housed and fed grain part of the year, in competition with the Southern Hemisphere, where they graze out all year round. Even in the territories where they graze over Government land hay must be cut for them for the winter. (392.)

Mr. Wood thinks that the woolgrowers would be better off under free wool. In some of the Territories and States the clip of wool actually increased during the free-wool period. In the eastern or farming States it decreased, but it had been continuously decreasing for many years. The American farmers do not seem to care to raise wool, but there is reason to believe that wool can be raised in the ranch States as cheaply and as advantageously as in Australia. In some localities, perhaps, flocks decreased rapidly under the Wilson law, but since wool is a by-product of the farm the probabilities are that the eastern woolgrower would receive about as much under free wool as he does now. Wool is not now such an important branch of husbandry in this country. It is chiefly in the hands of a few growers west of the Mississippi, and more than one-half of the clip of this country is raised on ranches, and largely, it seems, on free Government lands. The industry would not be injured by free wool. The business of raising wool in the far Western States where land is free is too profitable to be abandoned, and would continue to increase even though it should decrease in the East. There is not enough wool raised to supply the world's demand, and substitutes have to be resorted to. Wool will be wanted, and the demand will bring the production and encourage the raising of wool. The removal of the tariff would not necessarily increase the demand for wool, though the demand would be likely to be affected

if the price were lower. The natural expectation would be that this increase of demand would tend to bring up the price of wool. (516, 517, 518.)

2. *Free wool; attitude of manufacturers.*—Mr. JUSTICE states that there were only a dozen or 15 wool manufacturers in the United States who desired the experiment of free wool to be tried, and it was tried under the Wilson bill, and that every one of them, without exception, has confessed that it was a serious and costly error. Only very few woolen manufacturers will admit that wool duties are not too high; but while they would like to have them lower, not a single man is willing to take the risk of tariff changes. They prefer to endure any disadvantages they are at rather than to have a change even broached. (382, 397.)

Mr. DORNAN, a manufacturer of ingrain carpets, says that there were both advantages and disadvantages in the experiment of free wool. "The advantage of cheap material was a favorable factor; the loss of a market by reason of the want of employment of the working people was a factor the other way." (314.)

3. *Effect of tariff on prices of wool.*—Mr. JUSTICE says that in 1895 and 1896, when the Wilson tariff law was in full force, wool brought no more money in America, and sometimes even a little less money, than wool of the same kind brought in London. "The American woolgrower had been persuaded that if the tariff was taken off the American demand would elevate the London price, and he would get as good a price for his wool without tariff as he did before; but instead of that the London price declined a little, and the American price declined a great deal; and it fell from 20½ cents under the McKinley law in 1892, to 17½ cents under the Wilson law in 1895. In 1896, the price had gone up in London to 19 cents, but in the American market it only raised to 18 cents. It was worth actually one-half cent a pound in the American market less than the same wool brought in free-trade London. But in 1897, when the Dingley act was passed, prices immediately went back, so that on January 1, 1900, merino wool was worth 36½ cents in the United States that had been worth only 17 cents under the free-trade period, and which was worth only 31 cents in the London market at that time (January 1, 1900)."

October 1, 1900, the price of No. 60's tops was 44 per cent lower than that of January 1, 1900; 32 per cent lower than the average price of 1899, and 10½ per cent lower than the average price of 1892. The London value of XX Ohio, a similar wool, was 33½ per cent lower than the average price of 1899, and 12½ per cent lower than the average of 1892. On the other hand, the value of XX Ohio in the United States, where it was protected by the Dingley tariff, was only 3½ per cent lower than the average of 1892. In 1892, under the McKinley act, the American prices averaged only 10 cents a pound above London prices. In 1900, however, XX Ohio wool would not fetch over 17 cents in London, while its value in the United States was 28½ cents, a difference of 11½ cents. (378, 379.)

Mr. Justice says that the tariff makes a difference of about 75 cents a pound on the pure scoured wool which enters into a suit of clothes. The suit which he had on contained about 8 pounds of wool, so that the wool tariff made a difference in the cost of it of about \$2.25. (379.)

4. *Effect of tariff on wool on manufacture.*—Mr. WOOD says that with free wool and adequate protection on manufactured goods the woolen manufacturers could keep their mills much better engaged and could give employees more steady work. They would be enabled to produce a greater volume at a lower cost, and conditions would thereby be created which would admit of the exportation of goods. If the manufacturers were in a position to export, they could keep their machinery employed at times, when now it becomes necessary to shut down. Previous to the last election and incidental thereto, one-third of the machinery of the American Woolen Company was idle for months, and there was a loss to its employees of \$1,000,000 in wages. If the company had been able to export goods, this idleness and loss of wages might have been prevented, and the people of the country would have received great benefit in cheaper goods. The duty on wool is handicapping the woolen industry. Elsewhere, Mr. Wood states, that the mills are busier now than they were during the free wool period. During the years from 1894 to 1897, he says, under the free wool tariff, the woolen manufacturers suffered materially from the competition of foreign made goods. There was competition in most grades of goods, though the competition was, perhaps, more severe in the finer goods. Still the American manufacturers were able to meet about everything that could be made abroad, except perhaps overcoatings and fabrics of that description. They did not have sufficient time to try the free wool experiment satisfactorily. It is probable that if they had been given sufficient time they could have held their own, provided, always, that protection on the manufactured goods had been maintained. (515, 516, 518, 519.)

Mr. FOLWELL, a woolen manufacturer, testifies that his trade had no more than

got established under the McKinley bill before the Wilson bill was passed, and free wool, coupled with the importation of goods at a much lower price, stopped his mill. He only ran about half his capacity during the period of the Wilson bill. The markets were flooded both with goods and with wool. "But it is pretty well over now, and if we are simply let alone I think everything will work out right. In other words, with our trade any legislation, either one way or the other, will unsettle us." (214, 215.)

5. *Effect of tariff on woolens on manufacture.*—Mr. WOOD says that if the tariff were removed from woollen manufactures this country would be inundated with foreign goods. American woollen mills would be obliged to close, and could only resume operations through adjusting labor costs to meet European conditions. Even if they had free wool the manufacturers would be emphatically opposed to the abolition of the tariff on woolens. The woollen manufacturers do not look upon the tariff on woolens as a tax on the consumers. It certainly is not so to-day. (517.)

Mr. STEEL, a worsted manufacturer, says that previous to 1884 he was an importer of woollen goods, but the larger part of his business was in goods of American manufacture. He used to make contracts with mills for the exclusive control of their products, either throughout or in certain lines. The change of the tariff in 1883, though it was not a very heavy change, was enough to destroy entirely his business in American woolens. His house built up quite a large business in foreign goods, taking the place of the American goods. It established a factory of its own at Bradford, England, shipping the product almost entirely to this country. This continued until the McKinley tariff was enacted and entirely blocked these operations. Mr. Steel then brought a large part of his machinery to this country and established a factory at Bristol, Pa. The business has since been carried on without interruption, except by the Wilson tariff. That tariff compelled the house to stop the mills for a while and discharge the employees. (236, 237.)

6. *Rebate of tariff.*—Mr. WOOD refers to the fact that there is a rebate on exported woollen goods in the manufacture of which foreign wool has been used to the extent of the duty on the imported wool, but says that where foreign and domestic wool are both used in goods the calculation necessary to fix the amount of the rebate is so complicated that it is not practicable to take advantage of it. It would not be practicable to manufacture cloth wholly from foreign wools for foreign markets exclusively, as that would involve special patterns and styles apart from the general production of the mills, and would not pay. It would be to the advantage of the manufacturers if there could be a rebate on all manufactured woolens exported equivalent to the duty on the raw materials. (515.)

7. *Undervaluation of imports.*—Mr. STEEL says that while, according to his experience, purchases of woolens from England are usually made through commission houses, which charge a commission to the buyer instead of to the manufacturer, purchases of German goods are largely made through agents on this side, and occasionally from the German manufacturers direct. He believes, from his own experience, that undervaluation is a general practice of German manufacturers and exporters when they have to meet an ad valorem tariff. He mentions an experience of his own in which a German manufacturer suggested a valuation 10 per cent below the actual price as the usual custom-house valuation. Mr. Steel adds that when the tariff duty is 50 per cent, 10 per cent undervaluation is 5 per cent clear profit. He believes that the specific duty is a large element of protection to the American manufacturer. At the same time he believes that one of the reasons why undervaluations were successful was because the administrative law connected with the tariff law was never really enforced. He never knew an instance in which the elements of cost were demanded by the Board of General Appraisers. (240, 241.)

Mr. JUSTICE says that ad valorem duties give a great opportunity for fraud by undervaluation. Under the Wilson act all duties on woollen goods were ad valorem. For this reason he does not think that the increased importations shown by the statistics of the Treasury Department at all represents the actual increase. The figures show under the McKinley act \$37,500,000 in 1892, \$30,200,000 in 1893; and in 1894, when merchants restricted their purchases because they anticipated lower duties, \$17,300,000. Under the Wilson act they show \$38,500,000 in 1895, \$58,500,000 in 1896, and for the first 7 months of 1897, when goods were rushed in in anticipation of a higher tariff, \$49,200,000. (380.)

8. *Compound, or compensatory duties.*—Mr. JUSTICE explains the principle of compound, or compensatory duties. It takes 4 pounds of average unwashed wool, as the farmer sells it, to make a pound of cloth. If the duty on unwashed wool is 11 cents, a duty of 44 cents a pound on cloth is necessary merely to compensate

CLXXXIV INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

the manufacturer for the duty on his wool. This specific duty is no protection to the manufacturer. His protection is given by a further ad valorem duty, say, of 50 per cent, on the cloth. (382.)

C. Conditions of labor.—1. *Nationality.*—Mr. FOLWELL supposes that a great proportion of his employees are American. Some of the head men are English born, because, when he started his worsted mill, the industry was new in this country, and it was necessary to bring the head workers from the other side. (215.)

Mr. JUSTICE says that there is more American help employed in the Philadelphia mills than in those of New England. This is an advantage to Philadelphia. The French-Canadian element, which has become so large in New England, rarely improves in the first generation, and has no desire to improve. The American operatives in the Philadelphia mills are as self-respecting and progressive as other Americans. (385.)

2. *Employment.*—Mr. JUSTICE declares that during 1899 and 1900 the American woolen mills employed more people than ever before, and raised wages on the average 10 per cent. (379, 380.)

3. *Wages.*—Mr. STEEL speaks of a weaver, a woman who worked for him in England for about \$5 a week, who has since worked for him in Pennsylvania on the same loom and on similar goods and has made \$14 a week. Mr. Steel now has male weavers that earn as much as \$18 a week. He never knew one to earn over \$7.50 in England. Mr. Steel also speaks of a machinist who had worked 27 years in England and earned only 30 shillings a week, or about \$7.50, and whom he paid as much as \$18 in Pennsylvania, while "his regular pay, independent of overwork, was about \$16.50." (237, 242, 245.)

Mr. WOOD thinks that the wages of the operatives in the mills of the American Woolen Company average about 100 per cent higher than the wages paid in England. In a general way, the product per man and per machine is greater in this country. (515.)

Mr. FOLWELL testifies that his rates of wages are about the same now as under the McKinley bill, but that when the Wilson bill was in force the general rate was about 10 per cent lower, and about half his mill was stopped. He attributes the fact that wages are higher in America than in Europe exclusively to the tariff. He understands that while wages in American woolen mills are about double what is paid in France and Germany, they are a little less than double what is paid in England. (215.)

XVII. CARPET TRADE.

A. Development of the carpet industry.—1. *History.*—Mr. GEORGE MCNEIR, secretary of W. & J. Sloane, carpet dealers, says that half a century ago fully 90 per cent of the carpets consumed in the United States were imported, while to-day more than 90 per cent of the carpets consumed here are manufactured in this country. In 1850 it was estimated that the amount of capital employed in the carpet industry was about \$4,000,000, and the value of the yearly product about \$5,000,000; while to-day it is estimated that not less than \$50,000,000 is invested in the industry, and that the value of the yearly product is not much under \$75,000,000. It is estimated also that not less than 250,000 running yards of floor covering are turned out daily by the carpet mills of the country. In the carpet industry is included the rug industry. (708.)

2. *Causes of development.*—Mr. MCNEIR says that the wonderful growth of the carpet industry is due more largely to the protective tariff than to all other causes combined. (708.)

Mr. DORNAN, a manufacturer of ingrain carpets, also says that the carpet industry has been built up by tariff protection. (810.)

B. Conditions of capital and business.—1. *Prosperous condition.*—Mr. MCNEIR says that the carpet industry has shared in the prosperity which has been general throughout the country, and that there have been fair returns upon the capital invested. There has been no time in the past when more carpet and rug looms were in operation or labor more steadily employed than is the case to-day. (708, 710.)

2. *Prices.*—Mr. MCNEIR says that the prices of carpets have advanced 10 to 15 per cent in the last 5 years. Part of the advance is due to the imposition of the duty on carpet wools; part of it is due to the increased wages which are paid. (717.)

3. *Sales methods.*—Mr. MCNEIR says that during the past 5 years the cost of selling carpets has materially increased. Competition has made it necessary to put more salesmen on the road with a larger variety of qualities and patterns. Formerly business was confined largely to jobbers who made periodical trips to

New York, Boston, and Philadelphia markets to examine samples and place orders. (710.)

4. *Export trade.*—Mr. McNEIR says that American skill and ingenuity in the construction of looms and other carpet machinery have put American manufacturers far ahead of foreign manufacturers in the quantity of carpet produced per loom. This, together with a certain distinct and national difference in design and colorings, has enabled the American manufacturer to dispose of a part of his surplus product abroad. The value of our exports reached the highest point in 1894, when \$350,000 worth were exported. The decrease in the value of the exports since that time is in part due to the provisions of the Dingley law, which imposed a duty of 4 cents per pound on carpet wools costing less than 12 cents, and 7 cents per pound on carpet wools costing more than 12 cents. The English manufacturer bids in the light shrinkage wools at a little above 12 cents a pound, and the American manufacturer is obliged to pass them by, because he would have to pay a 7-cent duty on them, and is forced to buy the heavy shrinkage wools in order to get wools at a price permitting him to pay only 4 cents a pound duty. If such high duties are to be levied on carpet wools, they should be in the form of ad valorem rather than specific duties. The American manufacturer would then be able to secure a better quality of wool by paying perhaps only 1 cent per pound more than for a poorer quality, without being obliged to pay in addition 3 cents per pound more duty.

The falling off in the export business is not entirely due to the tariff on carpet wools, however. In 1894 there were no cheap moquette looms in England, but since that time the English manufacturer has put in cheap Axminster looms and by so doing has kept his home market for that class of goods for himself.

There is one other reason for the falling off of the export business, and that is that the demand for carpets at home has been so great as to leave a comparatively small surplus for shipment abroad.

It is true that 99 per cent of the duty on carpet wools is rebated when the carpets are exported, but the cost of tracing the imported wool from the time it enters the factory until the finished product is ready for export, together with the interest on the amount of duties locked up in the hands of the Government, reduces the rebate to about 85 per cent of the duty. The manufacturer must prove to the satisfaction of the customs authorities that the original bale of wool, on which claims for rebate are made, is the particular wool that went into the carpets presented for export. It is only the large factories that undertake to do any export business. (708, 709, 716.)

Mr. McNeir says that American carpet manufacturers, in common with other American manufacturers, must make a lower price on goods sold abroad, in order to compete with local products, than the price for which they could afford to sell goods in this country. Only surplus products are sold abroad. It is better for the manufacturer to run his mill steadily at its fullest capacity, thereby reducing to a minimum the cost of production, and dispose of his surplus at cost or nearly cost abroad, than to force his surplus production upon the home market and thus demoralize prices. At home he has only the competition of men who pay the same schedule of wages that he pays, and who are under the same heavy fixed charges; but the moment he enters the foreign market he is in competition with a schedule of wages from 40 to 60 per cent. less than he pays, and with manufacturers who are doing business under smaller fixed charges than are possible in this country. Unfriendly critics might argue from the fact that carpets sold abroad are sold at lower prices than at home, that the protection afforded to the carpet industry had served to increase prices to the consumer; but when it is remembered that a yard of Wilton carpet sold at wholesale in 1875 for \$3.25, and a yard of moquette carpet sold in 1877 for \$2, and that the wholesale price of a yard of Wilton carpet in 1900 was \$1.95, and the price of a yard of Moquette was 85 cents, it will be seen that home competition has taken care of the interests of the consumer and has reduced prices.

It would not be possible for American carpet manufacturers to have a surplus which they could sell abroad if the duties on carpets were materially reduced. They would not be able to enter foreign markets if they were compelled to struggle for their home market. It must be borne in mind that it is only the surplus product which is sold abroad. A man won't go to the expense and encounter the difficulties of selling in foreign markets if he can sell at home. It would not be possible for an American manufacturer to manufacture exclusively for the foreign market if he had to pay a duty on his raw materials, and at the same time had to pay high American wages, unless he had machinery so superior that he could turn out 75 per cent more goods on the same loom than could his foreign competitor. (709, 710, 719.)

CLXXXVI INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

5. *Tariff on carpet wools.*—Mr. McNEIR says that there are no carpet wools produced in this country. American wool is too fine a wool to be used in carpets. Carpet wools must be stiff and wiry and very much like hair, yet have all the wearing qualities of wool. Wools raised in this country are too fine in quality and do not stand up sufficiently. The American farmer has found it more profitable to raise the finer wools, which he can sell for from 20 to 25 cents a pound, than to raise carpet wools which he would have to sell for 8, 10, or 12 cents a pound. In view of the fact that carpet wools are not produced in this country, the duties imposed are unjustly high and place a serious burden upon one of the greatest industries of the country. (709, 717, 718.)

Mr. DORNAN thinks that the duty on carpet wool might safely be somewhat lower than at present, though he does not wish to raise the question. (314.)

6. *Oriental rugs.*—Mr. McNEIR says that oriental rugs do not compete either in price or in quality with any goods manufactured in the United States. They partake too much of the temperament, the traditions, and the environment of the people who make them ever to be successfully produced elsewhere. Especially would it be impossible for them to be produced in this country, where the slow methods of preparing the raw materials and the dyes and the weaving by hand are looked upon as primitive. Lower duties on oriental rugs could be adopted without in any way injuring any American industry. No interests suffered when the McKinley law rates of 60 cents a square yard and 40 per cent ad valorem were in force, nor, in fact, were there any protests even under the Wilson law rate of 40 per cent ad valorem. It is admitted that the importations of oriental rugs have greatly increased in the last few years, but the increase of importation is due more to the development of American taste than because the rugs can be purchased at anything like the price charged for American rugs and carpets. The importation of oriental rugs is regulated more by the conditions of the times and the general prosperity of the people than by the rates of duty. Instead of injuriously affecting any American industry, the importations of oriental rugs has done much to stimulate a demand for American products and to increase the popularity of carpets woven in one piece. American manufacturers of carpets and rugs recognize this fact. There should be a duty on oriental rugs, but the duty should not be higher than that imposed by the McKinley law. (710-712.)

7. *Straw mattings.*—Mr. McNEIR says that imported straw mattings come into competition with the ingrain carpets manufactured in this country. Some five years ago statistics were collected, which showed that the sale of carpets had been reduced fully 25 per cent through the increased importation of straw mattings. In 1900 the total importations of straw mattings amounted to \$2,040,961, that amount representing, as nearly as may be estimated, 38,300,000 yards. These 38,000,000 yards of straw mattings, which were brought into the country in 1900, unquestionably took the place of many millions of yards of ingrain and cheap tapestry carpets.

The cheapness of straw mattings is largely due to the cheapness of the labor employed in manufacture. In China the weaver receives 5 cents a day in gold, and in Japan weavers receive about 10 cents a day in gold, while in the United States weavers of ingrain carpets receive \$2 a day.

The highest priced mattings cost about 25 cents a yard, and the cheapest about 34 cents a yard in gold. Fully 95 per cent of all the straw mattings brought into this country under the present duties cost less than 10 cents a yard in gold. Upon mattings costing less than 10 cents a yard the duty is only 3 cents.

Formerly straw mattings were brought to this country in sailing vessels, but since 1899 fully 75 per cent have been brought by steamer. This change has brought about so great a reduction in the cost of transportation that a saving has been made in the cost of doing business which is nearly, if not quite, equivalent to the duties imposed.

Furthermore, power looms have been introduced in the manufacture of straw mattings, and by the use of these looms the cost of production can be reduced to one-fourth of the present cost of production. When the power looms come into general use in China and Japan, as they inevitably will, the importations of straw mattings into this country will undoubtedly be largely increased. The result will be that the manufacturers of the cheaper grades of carpets will be brought face to face with disaster, if not absolutely ruined, unless new and effectual tariff legislation comes to their relief.

It is estimated that in the year 1900 about 38,000,000 yards of ingrain carpets were manufactured, while the full capacity of the ingrain looms of the country is about 50,000,000 yards. The difference of 17,000,000 yards between the capacity of the ingrain looms of the country and the actual production represents a falling off due almost entirely to the competition of straw mattings. The production

of ingrain carpets has steadily decreased during the last five years and a large number of workmen have been thrown out of employment.

The average price of ingrain carpets in this country is 35 cents a yard, that average being made up from a range of prices extending from 18 cents to 85 cents. It is the cheaper grades of these carpets, which are made almost entirely of cotton, with which the imported straw mattings compete. (712-715.)

Mr. DORNAN, a manufacturer of ingrain carpets, says that from 1890 to 1898 the product of ingrain carpets was more than 50,000,000 yards annually; in 1900 it was not more than 33,000,000 yards. The cause of this falling off was not, he thinks, the increased use of hardwood floors and rugs, because the people who have hardwood floors are not the people who use ingrain carpets; they use a higher grade. The thing which has cut into the ingrain carpet trade is the importation of straw mattings. 8,000,000 yards of matting were imported in 1893, and about 40,000,000 yards in 1900. Mr. Dornan finds the reason of this great increase of imports in the conditions of foreign exchange which have been brought about by monetary regulations. About 1890 the value of silver was from 90 cents to a dollar an ounce. When the American Government discontinued the purchase of silver, the price fell to 58 cents. The Chinese laborer who makes these mattings is paid in silver, perhaps 20 cents a day. When this is converted into gold, at the present rate of exchange, it becomes 10 cents a day. The average value of the mattings imported, measured in silver, is 13.7 cents a yard. Its gold value is 6.7. Matting was free under the McKinley bill. When the Dingley bill was under consideration, Mr. Dornan and others secured from Mr. Dingley, Mr. Dalzell, and Mr. Payne a promise of a 10 per cent. duty on mattings. This was thrown out by the Senate, and matting was put on the free list; but by the heroic efforts of Mr. Quay, a duty of 3 cents a yard on mattings costing 10 cents, and 7 cents and 30 per cent. on more expensive mattings, was enacted. By the operation of the exchanges, the value of nearly all mattings is brought below 10 cents, so that they pay only the 3 cent duty. Adding 3 cents to the average import value, 6.7 cents, we obtain the value of 9.7 cents, duty paid, or 4 cents less than the nominal value at the place of origin. The duty does not make up for the operation of the exchanges under the influence of the reduced price of silver.

There are two remedies for this state of things. A high duty might be enacted; it would need to be as much as 10 cents a yard, or 130 per cent, to give efficient protection. The other possibility is bimetalism by international agreement. England, Germany, France, Austria, Russia, and the United States, if they would agree, could control the world in this respect. Mr. Dornan realizes the great difficulty of applying either of these remedies. So far as the tariff is concerned it is almost an absolute impossibility to make an amendment in one respect without opening up the entire question.

Not less than 25,000 work people are engaged in the production of ingrain carpets, and for the last 3 or 4 years they have not had two-thirds employment. The condition of the industry absolutely demands some relief. The highest selling price of an all-wool ingrain carpet, which is the one that gives the best results, is 47½ cents a square yard. The imported matting probably retails at 15 cents, or 20 at the outside. If something is not done to protect the ingrain carpet industry, it will be wiped out. Eighty per cent of the whole product of ingrain carpet is made in Pennsylvania, and 95 per cent of this 80 per cent is made in Philadelphia. The largest producer of ingrain carpet, however, is in Lowell, Mass. (310-315.)

C. Conditions of labor.—Wages.—Mr. MCNEIR says that there has been an advance in the wages of the workmen employed in the carpet mills of from 10 to 15 per cent since 1895. More important even than the advance of wages is the fact that employment has been steadier, so that, as a matter of fact the yearly earnings of the employees have increased at least 30 to 40 per cent. (710.)

Mr. Dornan thinks that the wages paid in this industry in Philadelphia are at least 35 per cent higher than those paid in New England and New York. (314.)

XVIII. SILK TRADE.

A. Development of silk manufacture.—1. History generally.—Mr. JACQUES HUBER, of the firm of Schwarzenbach, Huber & Co., of New York, in the treatise prepared by him and submitted by Mr. Franklin Allen, states that the beginning of the silk industry in the United States dates back to the years 1823-1890, during which time the first trials in the manufacturing of silk trimmings were made. In the following decade, 1830-1840, experiments were more frequent. The heavy immigration during the years 1840 to 1850 aided in the development of the industry. The years from 1850-1860 proved disastrous to the industry, and it barely escaped destruction. The protective tariff system, which grew out of

CLXXXVIII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

Civil War conditions, brought the silk industry to life again and furthered its development. At the beginning of the seventies the yearly silk production of the United States amounted to only about \$5,000,000; to-day the United States ranks first among civilized countries in regard to the quantity of silk manufactured, and second in regard to the selling value of the manufactured goods, France being first. (870, 871.)

Piece-dyeing and printing branches were established early in the nineties in this country, and have increased rapidly in number under the operation of the Dingley tariff law, so that to-day the American manufacturers dye and print, not only large quantities of domestic raw silks, but also some imported silks. The printing works run only from November to April on full time. (874.)

The exhibit of American silks at the Paris Exposition was not representative of the importance of the silk industry in this country. To have given an exhibit worthy and representative of the immensity and the many-sidedness of the industry would have involved an expenditure of a great deal of money, time, and labor. (660.)

Mr. FRANK W. CHENEY, treasurer of Cheney Brothers, silk manufacturers, says that at first the only business in silk in this country that amounted to anything was done in sewing silks and threads. The production of woven goods did not amount to much until some time in the fifties. Ribbons were first manufactured. Experiments were going on all the time in weaving, but the impetus to the production of silks came when the war tariff was enacted. Practically the development of silk weaving dates from that time. To-day from two-thirds to three-fourths of the silks consumed in the United States are made in this country. There has been considerable increase in the consumption of silks in this country in recent years, this being due to the increased prosperity of the country and the ability of manufacturers and importers to supply silks at much lower prices than they were able formerly to do. (736, 737, 730.)

Mr. CHARLES F. HOMER, treasurer of the Silk Association of America, says that prior to the high tariff, which was imposed because of the necessities growing out of the civil war, the silk industry in this country was of very little account. When the duty of 60 per cent was placed upon silks, those who were interested in the silk-importing business immediately began to consider the possibility of manufacturing in this country, and those who had previously been interested in a small way in silk manufacturing were stimulated to extend their business. The increased demand for American silks and the lowering of the cost of production have led to the extension of the industry.

At the beginning of the Civil War, the American market was supplied by European manufacturers almost exclusively; to-day the market is largely supplied by the production of American looms and of American labor. The foreign silks consumed in this market are mostly high fashionable novelties. There are no grades of silks which can not be made in this country. There are certain silks in which the design is of more account than the grade of silk. While it would be possible to manufacture those goods in this country, the design originates in Paris and the goods are imported as Paris novelties.

There have been very marked improvements in machinery, in methods of production and in the organization of factories. Power looms were first employed in the manufacture of silk in this country. They came into use within a few years after the passage of the first high tariff act. The improvements in machinery have applied not only to weaving machinery but to every branch of the silk manufacturing industry.

Formerly the silk industry was divided into specific branches, but now, in this country, though not in Europe, all the different branches of the silk industry are carried on under one management, and many of the manufacturers to-day take a bale of silk in the raw and turn it back upon the market a finished product in every respect. (700, 702, 703.)

Mr. FRANKLIN ALLEN, secretary of the Silk Association of America, presents tables compiled from the census figures of 1900, showing that there are 483 silk factories in the country; that the total amount of capital invested in the industry amounts to \$81,052,201; that the average number of employees is 65,416; the total yearly wages, \$20,982,194; the output, \$107,356,258; the total number of looms in use, 44,806, of which 44,138 are power looms and 178 hand looms. In 1880 the number of power looms employed in the silk industry was 5,821 and the number of hand looms 3,153. In 1890 there were 20,822 power looms in use and 1,747 hand looms. From the figures given it appears also that New Jersey ranks first and Pennsylvania second in the number of establishments, the capital invested, and the yearly output; that New York ranks third in the number of establishments and in yearly output, and fourth in the amount of capital invested, and that Con-

necticut ranks fourth in the number of establishments and yearly output, and third in the amount of capital invested. (685, 686.)

2. *Development in Pennsylvania.*—Mr. ALLEN says that there have been serious and continual disagreements between the labor employed in the silk mills in New Jersey, especially in Paterson, and their employers. Because of these labor troubles the manufacturers have looked around for opportunities to establish the industry in other places. As a result, the silk industry has been largely developed in Pennsylvania. (680.)

Mr. HOMER says that during the earlier years of the silk industry very high wages were paid. The wages paid were so high that it was impossible for American manufacturers to compete successfully with foreign goods. When plain weaves became fashionable it was found that the work could be done more cheaply, and many manufacturers built new mills in the Lehigh Valley, where now they weave plain grosgrain silks and where they employ the daughters of miners as operatives. They took this means of reducing the cost of production and of avoiding labor complications. The labor in Pennsylvania is more reliable and less liable to labor troubles than is the case in Paterson. Nearly all of the staple plain products of the country are now manufactured outside of Paterson. Those classes of goods which require particular skill, such as fancy goods and classes of goods which have to be made at short notice and with quick changes of machinery and those which require diversified knowledge, are still largely manufactured in Paterson. (702, 703.)

3. *Development of sewing-silk manufacture.*—Mr. IRA DIMOCK, president of the Nonotuck Silk Company, a concern manufacturing all kinds of silk threads for sewing purposes, says that in 1858 that company produced only 250 pounds of silk a week, and employed but 50 hands; now the company produces 6,000 pounds a week and employs 750 hands. In 1852 the company made the first machine twist ever made for Mr. Singer, who was then experimenting with the sewing machine. At that time the company made 5 pounds of sewing silk for him. In the year 1861 it sold him \$100,000 worth. It was not able wholly to supply his needs, and he bought a silk factory in Newark, so as to be able to make his own silk. (693, 694.)

4. *Development of silk dyeing.*—Mr. JACOB WEIDMANN, of the Silk Dyeing Company of Paterson, N. J., says that when he came to this country in 1867 the silk-dyeing industry was of very little consequence. To-day it is fully as well established in this country as abroad. In some respects American dyers are ahead of foreign dyers, especially in turning out work quickly. They have better machinery and are better equipped in every way than are the foreigners. The dyeing in this country is better than that of Europe, just because the goods are got out more quickly, and are therefore less handled. Silk is a fine fiber and does not wind so well when much handled. In this country yarn-dyed silk can be delivered in 3 or 4 days, whereas in Europe it requires usually as many weeks. The dye works in this country are worked day and night in order to get goods out quickly. Notwithstanding the fact that labor is more expensive in this country, silk dyeing can be done here somewhat more cheaply than it can be done abroad, this being due to the greater efficiency of American machinery and of American labor. Most of the dyes used come from Germany and France, though some American dyes are used. (704, 707.)

5. *Causes of development.*—Mr. HOMER says that the protective tariff has been the cause of the remarkable development of the silk industry in this country. American silk manufacturers will be able to compete with foreign manufacturers only when American labor is satisfied to accept European wages. (700.)

Mr. OTTO ANDREAE, Jr., of the firm of William Schroeder & Co., of New York City, says that the silk industry, so far as broad silk weaving is concerned, would never have been established in this country except for the protective tariff. (692.)

Mr. HUBER states that the silk industry in the United States owes its development to the natural capability, common sense, enterprise, and self-confidence of the American merchant and manufacturer; to the fact that capital is always ready to support enterprise in the United States by giving extensive and liberal credits; to the support which is given to industrial enterprises by city and State governments in the form of tax privileges, donations of lots, etc.; to the intellectuality of the American technician, who has invented time-saving machinery; to the ability of the American operative; and to the easy intercourse between manufacturer and dealer, which enables the former to get fully and properly acquainted with the needs and wants of the latter. (670.)

6. *Benefit to consumers.*—Mr. ANDREAE says that the American consumer would undoubtedly have to pay a great deal higher price for silks if the silk industry in this country should be destroyed. The foreign manufacturers would have abso-

CXC INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

lute control of the business and could advance prices or do whatever they pleased. (690.)

Mr. ALLEN presents a list showing the low prices at which American silks have recently been advertised for sale in the daily papers, and says that the fact that silks can be bought at such low prices is due to the establishment of the silk industry in the United States. The low prices are due to home competition. (682.)

B. Conditions of capital and business.—1. *Silk Association of America.*—Mr. ALLEN says that the Silk Association of America is an organization of gentlemen interested in the silk industry, and was formed to develop and protect their common business interests; to have supervision over all matters that affect their interests; and to promote, in all suitable ways, the development of the silk industry. The association is not a business organization in the ordinary sense, and has no capital stock. (677.)

2. *Cheney Brothers—Business and capitalization.*—Mr. CHENEY says that Cheney Brothers now produce spun-silk yarns of all kinds, reel silk, trams and organzines, a great variety of woven goods, both piece-dyed and printed; upholstery and tapestry goods; ribbons; velvets, with both cotton and silk back, and plushes. In fact, they can make any variety of silk which is called for. The silk dress goods which they produce sell for from 75 cents to \$1 a yard. All kinds of figured, plain, and printed silks are sold within those limits of price. When the firm first began business it had only about from half a dozen to a dozen girls employed; now it employs from 2,600 to 2,700 people. At the beginning the firm used only about 10 pounds of raw silk per week; now it uses 1,000 pounds a day; including spun silk, 2,000 pounds a day. The nominal capital of the company is \$1,000,000, but probably six times that amount is invested in the business. The firm does a wholesale business entirely and sells its own goods, maintaining a sales department in New York and branch offices in Chicago, Boston, and Philadelphia. The yearly output is between \$5,000,000 and \$6,000,000. (726, 727, 732.)

3. *Equipment of American silk mills.*—Mr. HUBER says that the machinery used in American silk mills is such that a simple weaver can do work which in other countries can be done only by the most skilled and experienced workers. American machinery need not fear comparison with the best machinery manufactured in Europe. The prices also are low, and imported looms are no longer much in demand. One American concern manufactures 80 different types of looms.

The American manufacturer of silk has to devote considerable attention to the study of styles and fashions, and must be able to turn out many different kinds of goods. It is astonishing to note the facility with which the American mill changes from the manufacture of light to heavy silks, from simple to complicated, from plain to faconné goods, and from yarn to piece-dyed weaves. For the last 10 years American mills have manufactured every weave, article, and quality which are known to mechanical weaving or which through alterations in machinery or simplification in manufacturing could be done by power-loom weaving. The mill of to-day produces, with the exception of a few Lyons specialties, every style of silk placed upon the market. (673, 674.)

Mr. Huber says that quick delivery is a very important matter in the silk industry, and that the American dyer can deliver uncharged silk in 2 days, black and colored organzine and tram weighted, 70 to 80 per cent, in 5 to 6 days, and heavy-charged silk in 8 to 14 days. In special cases shorter deliveries can be made. Moreover, the work done is perfectly satisfactory. As far as charging is concerned, more careful methods are employed than are followed in Europe. (672.)

Mr. Huber says that American silk throwing is done principally on belt spinners which are run 11,000 to 12,000 turns a minute on first time over and 9,000 turns second time over. American machines are second to none. Many American manufacturers now have their own throwing plants. The reason for this is not so much to effect a saving in cost as to be able to make quick deliveries and to examine the silks thoroughly. The continually advancing wages in New Jersey have led to the establishment of throwing plants in more remote parts of the country, principally in Pennsylvania. (672.)

Mr. WEIDMANN says that for some years most of the silk machinery used in this country was imported. Now most of that used is made in the United States. The best looms in the world are made here. It is universally recognized that an American loom has greater speed than a foreign-made loom; and lots of looms are exported from this country to Europe, especially to Switzerland. (707.)

4. *Process of silk manufacture.*—Mr. CHENEY says that the treatment of raw silk consists of winding, spinning, or throwing, doubling, twisting, and reeling. This converts the raw silk into yarn. Then it goes to the weaving department. If the yarns are to be used for piece-dyed or printed goods, they are usually woven in the gum; if for yarn-dyed goods the next process after throwing is to ungum

and dye the silk. The weaving department makes the warp. After the warp is made the silk that is used for filling is put upon little bobbins or shuttles. That is called quilling. Then follows the weaving and then the finishing.

In the United States practically all silk weaving is done on power looms. There may be a little hand work on specialties, but it is very inconsiderable. Until very recently the bulk of the weaving in France has been done on hand looms, and a great deal of the very fine high-grade work is still done on hand looms. Some power looms have been introduced into Japan, but the bulk of the goods manufactured there is still made on hand looms.

Under the old system of manufacturing silk, in Lyons and elsewhere, a man calling himself a manufacturer did not necessarily have any mills or machinery. He had a warehouse, bought his trams and organzines, sent them to the dyers, delivered them to the weavers, and later sent them to the finisher, and then sold them. Of late years something approaching our factory system has grown up abroad, however. Comparatively few of the American manufacturers have finishing departments now. At the works of Cheney Brothers everything necessary to convert the goods from the raw material to the finished product is done. (727, 728, 730.)

5. *Raw silk and silk culture.*—Mr. HOMER says that the raw material in the silk industry is the silk after it has been wound from the cocoon. It comes wholly, with the exception with what is called waste silk, in the form of hanks. The largest percentage of imports for weaving purposes comes from Japan. For other branches of the business large quantities of Chinese and Italian silks are used. Some raw silk comes from France. There have been a number of experiments made in the United States in raising silk, but all have proved commercially unsuccessful. It is impossible for any labor in this country to compete with the extremely cheap labor of the Orient or of Italy in the raising of silk. (700, 701.)

Mr. CHENEY says that the principal supplies of raw silk come from Japan, China, France, and Italy. There are some sorts that come from India, Turkey, and Spain, and considerable silk of good quality is now coming from Sicily. A great deal of honest exertion has been put forth in the effort to establish silk culture in this country, but it has resulted only in demonstrating that it can not be carried on profitably. Although in some parts of the country climatic conditions, soil, and everything are favorable to the growth of the silk worm, yet it is impossible for Americans to compete in a business that requires so much individual hand labor, when labor can be had in France for from 30 to 25 cents a day, in Italy for from 15 to 20 cents a day, and in China and Japan for from 5 to 10 cents a day, while the same grade of labor in this country would cost a dollar a day. Silk culture in the United States is impossible so long as this disparity in wages exists. Lyons is the center of European silks, Yokohama is the silk center of Japan, Shanghai of China, and Calcutta of India. There is a very important raw-silk trade now carried on in New York, so that the advantages of direct importation have, to a great extent, disappeared. (726, 727.)

Mr. HUBER, states that the imports of raw silk into the United States in the year 1900 amounted to \$44,500,000. Most of the raw silk imported comes from Japan, China, and Italy. Numerous trials to transplant the raising of silk to American soil have failed. In consequence of the increasing manufacture of raw weaves, the raw silk of Europe has lately been favored to some extent. As a rule, the American broad silk manufacturer uses only the best quality of raw material, and generally only coarse sizes. While formerly the demand for raw silk was mostly for grège, during the last few years the smaller manufacturers have started to buy *ouvrees*. (671, 672.)

Mr. ANDREAE embodies in his testimony a table taken from the annual report of the Silk Association of America, showing the imports of raw silk by countries, as given by the Bureau of Statistics of the United States Treasury Department for the years 1897 to 1900. From this table it appears that the total imports of raw silk into this country in 1900 amounted to \$31,790,531; in 1899, to \$42,776,678. Japan leads in the amount of imports into this country, both as to the number of pounds imported and as to the value. China comes second in respect to the number of pounds, third in respect to value of the imports. Italy comes third in respect to the number of pounds and second in respect to value. In 1899 Japan was first both as to pounds and value, China was second both as to pounds and value, and Italy was third. (691.)

6. *Reel silk and spun silk.*—Mr. CHENEY says that reel silk is silk as it is reeled from the cocoon. Spun silk is made from the waste silk taken from the pierced cocoon. The pierced cocoons are the cocoons which have been laid aside for reproduction, and from which the moth has eaten its way out. There is a very wide range in the prices of waste silk. It can be bought anywhere from 10 cents up to 75 cents a pound. Only the best grades are used in this country. Spun silk

CXCII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

is worth from \$2 to \$3 a pound; reel silk costs from \$2 to \$4 a pound, and when converted into threads and yarns is sold for \$7 to \$8 a pound. (727.)

7. *Quality of American silks.*—Mr. WEIDMANN says that the silks made in this country are more durable than are the imported silks. They are weighted less than are those made in Europe. There are a number of manufacturers of silk velvets and plushes in the United States, and the silk velvets produced are equal in every way to those produced abroad. The American consumption of silk velvets and plushes amounts to about \$10,000,000 a year, and only about \$5,000,000 worth of these are imported. As good printed silks are made in the United States as are made in France. American manufacturers are able to work in as many colors as are the French manufacturers, and the colors are as well blended and as permanent. They use the same colors as are used in France, and the chemists in this country are as good as the French chemists. If a chemist over there has ability, he likes to come to this country because he gets higher pay. There is not any question but that all varieties of silk goods, equal in every way to European goods, will be produced in this country if present conditions are maintained. (704, 707.)

8. *Possible substitutes for silk.*—*Ramie.*—Dr. WILSON, director of the Philadelphia Museums, exhibited before the commission specimens of ramie, and stated that the Commercial Museum at Philadelphia had on exhibition samples of the crude plant, which had been sent to it from every country where the plant is grown. Dr. Wilson also exhibited samples of yarns made in England from ramie fiber, and stated that foreign countries were using this fiber in a commercial sense more successfully than it was being used in this country. The difficulty in handling the product is found in the want of proper machinery and proper processes to degum the fiber. The fiber possesses a gum which prevents proper spinning, and the processes to degum it so far discovered make the fiber too costly. Manufactures from ramie would come into competition with both cotton and silk, and especially into competition with fine linen. A very fine quality of paper, also, may be made from ramie. The plant could be grown in the Southern States, and there would be more profit in its production than there is in hemp. (445, 446.)

Mr. CHARLES F. HOMER, treasurer of the Silk Association of America, says that there have been some attempts in this country to use ramie, but such attempts are in advance of the market, and ramie has never been a factor of sufficient importance to be considered commercially. (701.)

9. *Adulteration of silk textiles.*—Mr. HOMER says that there is no adulteration of silk textiles, as there is in the case of woolens, through the mixing in of cotton thread in the weaving. There are many combinations of materials, mixtures of silk and wool, silk and cotton, silk and worsted, etc., but these goods are, with very rare exception, sold for exactly what they are. (701.)

10. *Sales methods.*—Mr. HUBER states that American silk manufacturers depend for the sale of their goods largely on commission houses or selling agents, whose interests do not always correspond with their own. In many cases, the manufacturers are dependent upon the commission houses for advances. Because of this they are deprived of independent action. Prices, which ought to be fixed according to cost of production, are mostly regulated through competition, and even under favorable conditions staple articles are sold at too small a profit to insure the manufacturer against losses in a poor season. (674, 675.)

11. *Prices.*—Mr. CHENEY says that it is hard to compare the prices of silks during the course of the last 20 years. Silk is not an article the price of which is controlled by the cost of production. It is at the mercy of the fashions. It is safe to say, however, that silks can be bought for not more than half the prices charged for the same grades 20 years ago. (730.)

Mr. ANDREAE says that the prices of silk textiles are entirely controlled by competition regardless of the cost of production. If there is overproduction the price goes down, the price being entirely regulated by supply and demand. An excess of importation would have a similar effect on prices. (690.)

12. *Import trade.*—Mr. Andraee says that there are imported into this country certain specialties of the better qualities of silk textiles which do not come into competition with any manufactured in this country. Certain other specialties, which do come into competition with American manufactures, are also imported. If no foreign silks were imported, there would be an opportunity in this country for the production of some qualities which are not produced here now. Nevertheless, good, healthy competition from all over the world is a very good thing. In former years there have been excessive importations, but that has not been so much the case lately, since specific duties have been imposed on silks. At times European manufacturers have sold their surplus stocks here at the best prices they could get, irrespective of the cost of producing the goods. Mr. Andraee embodies in his testimony a table taken from the annual report of the Silk Association of

American, showing the imports, by countries, of silk textiles, at invoice value, as given by the Bureau of Statistics of the United States Treasury Department for the years 1896 to 1900. From this table it appears that France is far in the lead as regards the value of silk exports to this country. Germany comes second, Switzerland is a close third, and Japan is fourth. In 1900 the total value of the imports from all countries, at invoice value, was \$29,719,518. A table is also given showing the invoice value, in dollars, of the importations of silks according to classes, i. e., of dress and silk piece goods, ribbons, laces and embroideries, spun silk, velvets and plushes, clothing, etc. Mr. Andrae says that France will always have a certain advantage over other countries because the fashions originate there and because they make the better qualities of goods. (690, 691, 692.)

Mr. ALLEN says that 30 per cent of the silk textiles consumed in this country are imported. The total consumption of broad silks in this country amounts to about \$75,000,000 per annum. Of this amount, about \$23,000,000 are imported. The total consumption of all kinds of silk textiles amounts to about \$106,750,000. Of this amount, about \$31,250,000 are imported. At times foreign silk manufacturers have dumped their surplus stocks in the American market, selling them at prices as low as were necessary to enable them to dispose of their goods. This was done, for the most part, when ad valorem duties were imposed exclusively. The levying of specific duties tends to do away with such practices. Mr. Allen submits a table giving the value of the silk textiles imported into this country, by years, from 1891 to 1900, inclusive. (677, 678, 679, 680.)

Mr. CHENEY says the importations of silk goods are now practically limited to the very high grade novelties and to the very cheapest grades. These cheap grades are more or less adulterated. (727.)

13. *Export trade*.—Mr. ALLEN, Mr. ANDRAE, and Mr. HOMER all say that there are as yet no exports of American silk textiles which are worthy of consideration. (679, 690, 703.)

Mr. HUBER says that the export of American silks under normal conditions is not to be expected at present, as the cost of production and the wages paid are too high to admit of that. (675.)

Mr. ALLEN submits as a part of his testimony an extract from the annual report of the Silk Association, which states that if any American silk manufacturers have a chance to succeed some day in exporting goods it is the sewing silk manufacturers, for American sewing silk is the best in the world. Foreign manufacturers used to think that the American protective tariff would protect them from American competition in foreign markets, but this is turning out not to be the case. (687, 688.)

Mr. CHENEY says that his firm is trying to build up an export trade in silks, but that it has not yet succeeded. It costs more to manufacture goods in this country than the amount for which they can be sold in foreign markets. Cheney Brothers are looking for some dumping ground abroad where they can unload their surplus stock at the end of the season. They would rather sell goods at cost or even below cost outside of the country than to sell them in that way here because to do so would demoralize the market for the coming season. (781.)

14. *Domestic competition*.—Mr. ANDRAE says that competition between American silk manufacturers is very fierce. For the past year or two it has come very near to being ruinous. The weaker manufacturers, of course, suffer more than do those who have sufficient capital to carry on their business satisfactorily. There is absolutely no arrangement between the manufacturers for the maintaining of prices. (692, 698.)

Mr. CHENEY does not think that there has ever been a genuine attempt to form a combination of the silk manufacturing interests, though the manufacturers of sewing silk and twist have made some approach to a combination. If all the silk manufacturers of the country would combine to the extent of putting all the purchasing of raw materials into the hands of one organization a great deal of competition would be eliminated and the results would be very beneficial. (734.)

15. *Earnings*.—Mr. Cheney says that the profits made in silk manufacturing are very conservative indeed. Taking the business of Cheney Brothers for a long term of years, the yearly profits would not average more than 10 per cent on the actual capital invested. (735.)

16. *Tariff legislation*.—Mr. Cheney says that the silk industry has always been dependent upon the protective tariff. Primarily we lacked knowledge in this country as to how to manufacture silk goods, and although we have now learned how to make them, the disparity of wages is such that it is impossible to compete on even terms with foreign manufacturers. Many of the disadvantages under which American manufacturers formerly labored have been overcome, but not to such an extent as to make them independent of the tariff. So far as possible, spe-

CXCIV INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

cific duties should be imposed on silk goods. It would be difficult to compete with foreign velvets under ad valorem duties. (781.)

Mr. CHENEY says that if there were a material reduction in the tariff on silks and velvets the silk mills in this country would either have to stop or find some way to make cheaper goods. There would have to be a reduction in both profits and wages. During the years from 1893 to 1897 the silk industry was in a very depressed condition. Nominally, Cheney Brothers paid the same wages to their employees per day or per piece, but there was a cutting down in the hours of employment per day. The depression felt by the silk industry was shared in by all the industries of the country. Changes in the tariff and the uncertainty which those changes created produced a general want of confidence in the business world. (731, 732, 733.)

Mr. WEIDMANN says that if the tariff on silks were removed there would be an immediate reduction in the wages of the workmen in the mills. If the workmen are willing to work for lower wages the industry can get along with a lower tariff. It is possible that if the tariff were removed American manufacturers would take their machinery to foreign countries and introduce American methods, and manufacture there for the American market. When the tariff on silk was lowered during the Cleveland Administration the silk industry suffered greatly, and few, if any, of the mills ran on full time. If the tariff should again be lowered, there would be a repetition of that experience. There is no doubt that the tariff has aided in the development of the silk industry in this country. (706, 707.)

Mr. HOMER says that the reduction of the tariff on silks would have a depressing effect on the silk industry. It would bear more hardly upon the laborer than upon the employer. The employer is always able to take care of himself. (738.)

Mr. ANDREAE says that the present tariff rates are sufficient both to steady prices and to give a fair return to the American manufacturer, without giving to him any monopoly of the home market. The only change which Mr. Andraee would care to see made in the tariff would be the making of the duties on silks generally specific instead of having the duties a combination of ad valorem and specific duties. The need for such a change is not great enough, however, to justify tariff revision.

If there should be a reduction of 5 per cent in the duties on silk goods imported from France it would undoubtedly facilitate the importation of goods from that country. If such a reduction should be made there certainly would be good reason for making a similar reduction on silks imported from Germany. (691, 692.)

Mr. DIMOCK says that the duty on sewing silk could be lowered perhaps 50 per cent without the industry suffering any injury. There would be no advantage to the consumer, however, in the lowering or in the abolition of the duties. If the duties were blotted out, the prices would be much higher than they are at present. The consumer gets his goods to-day at as low a price as that for which manufacturers can afford to sell them. Foreign sewing silks are not of nearly so good a quality as are American sewing silks, and probably not half of 1 per cent of the sewing silks used in this country are imported. So far as woven silks are concerned, the tariff is a necessity for the continuance of the industry, and will be for a good while yet. Home competition will put the prices down just as low as those for which the article can be sold, considering the cost of production. (696, 697.)

Mr. ALLEN says that silk manufacturers are almost universally in favor of the imposition of specific duties on silks. Specific duties, although not so desirable in theory as ad valorem duties, are more satisfactory in fact. Under the Dingley tariff, many of the silks coming into this country are subject to specific duties. Because of this there has been very much less undervaluation of goods than was the case previous to the passage of the Dingley Act. This is the universal testimony of the trade. Under a system of specific duties, there is no advantage to be gained by undervaluing goods. The extension of specific duties to all classes of silks would be a very desirable thing. Mr. Allen quotes from a letter received from a manufacturer of silk laces to the effect that the goods manufactured by him are subject to ad valorem duties, and that it is his belief that silk laces do not pay half the duties which they should pay; that cotton laces are subject to specific duties and that, therefore, the best part of his business is now in the making of fine cotton lace rather than in the making of silk lace. (678, 688.)

17. *Present conditions.*—Mr. ANDREAE thinks that the silk industry is fairly prosperous at present. (693.)

Mr. HOMER is of the opinion that at present there is a slight depression in the silk industry. This is due to a variety of causes. There is no reason to complain of the quantity of goods consumed, but the returns for the business done are unsatisfactory. Last year there was an abnormal rise in the price of raw silk without any corresponding rise in the price of the finished product, and the goods were sold below what could be considered a satisfactory price, in view of the high price of raw material. (701.)

C. Labor organizations.—Mr. ANDREAE says that there are some shop unions among the hands employed in the silk mills. At times the employees belong to the general trades unions, but they are not dominated as much by the general unions as are the employees in other trades. (698.)

Mr. CHENEY says that at the present time there are no labor organizations among the employees of Cheney Brothers. (733.)

Mr. WEIDMANN says that the workmen employed by the Silk Dyeing Company are not organized. (705.)

D. Relations of employers and employees.—Mr. DIMOCK says that the employees of the Nonotuck Silk Company have the most kindly feeling toward the company. There has never been a strike. The company provides tenements for some 57 of its employees. It also provides a boarding-house in which 60 of the girls employed by the company are accommodated. The cost of running the house is \$2.50 a week for each occupant, and that is the amount charged to the girls. (694, 695.)

Mr. WEIDMANN says that there has not been any strike of the workmen employed by the Silk Dyeing Company since 1893. There was a strike in 1893, which was due not to conditions in the mills, but was a sympathetic strike. (705.)

E. Conditions of labor.—1. *Generally.*—Mr. HUBER says that many of the workers in the silk mills own their own homes. Food is cheap and is of good quality, and the operative lives plainly and endeavors to save for a rainy day. There are few operatives in the silk mills who do not have savings-bank accounts. (676.)

Mr. DIMOCK says that the employees of the Nonotuck Silk Company are of a very high class. Social conditions have been very much improved by reason of the better education which it is now possible for the employees to obtain, and because of the opening of free libraries and reading rooms and the increased publication of newspapers, periodicals, etc.

Many of Mr. Dimock's employees own their own homes. (694, 697.)

Mr. CHENEY says that a great many of the employees of Cheney Brothers live in homes of their own. The company has about 300 houses which it rents to its employees. The rents received net very little return on the capital invested. (736.)

2. *Nationality.*—Mr. HUBER says that the workers employed in American silk mills are in part American born and in part foreigners. The American operatives are to be found mostly inland, while the foreigners are for the most part employed in the manufacturing districts near New York. All nationalities are to be found among the operatives. (675, 676.)

Mr. DIMOCK says that all nationalities are employed in the mills of the Nonotuck Silk Company. A great many of the employees are German and a great many are Irish. There are a few French Canadians. They make very good help. Many of the girls employed by the company are the daughters of farmers who live in the outlying districts. (694.)

3. *Wages.*—Mr. HUBER says that the weekly wages paid to operatives in silk mills in New Jersey are about as follows:

Quilling, boys and girls, \$4 to \$6; winders, \$6 to \$8; warpers, \$12; beamers, \$15; weavers, \$7 to \$14; twistors and drawers-in, \$12; day laborers, male, \$8 to \$10; day laborers, female, \$7 to \$8. In Pennsylvania the wages vary from \$3 to \$8 per week. The cost of living is not greater than is the cost of living in European manufacturing cities. (676.)

Mr. CHENEY says that in the mills of Cheney Brothers work is for the most part paid for under the piecework system. The wages paid are averaged every month, but these averages are a little deceptive, because the wages paid depend upon the quality of the work done and the capability of the individual laborers. Children earn on an average \$3 or \$4 a week; competent girls, from \$6 to \$7 a week. The weavers average \$2.11 a day on piecework, the wages running all the way from \$1 to \$4 a day. The wages of the employees in the silk mills in France do not average more than one-third the wages of American operatives. Four or 5 francs a day are considered very large wages for men in France, and the hours of labor are longer there than in this country, too. In England the wages are about one-half what they are in this country; in Germany and Italy, about one-fourth. The output per employee would be as large in the foreign mills if the same machinery were used, but the foreign mills are not equipped with modern machinery.

On account of the greater cheapness of labor, the foreign manufacturers can do a great many things which American manufacturers can not afford to do. They can take the poorer grades of raw material and use them with profit by putting a great deal of labor upon them. American manufacturers can not afford to do that, and are obliged to use the best of everything. (729.)

Mr. WEIDMANN says that a good workman in the silk-dyeing mills in Switzerland is paid about \$4 a week, while the poorest-paid laborer in this country earns \$9 a week. The best dyers in Switzerland get from 25 to 40 francs a week, while in this country they are paid from \$15 to \$30 a week. There is no local uniform scale of wages for silk dyers in this country, but each dyer gets whatever he is worth. If one man has more ability than another, he gets more pay. The rate of wages depends entirely upon the capacity of the workman.

Mr. Weidmann says that he thinks that workmen have as much right to name the wages to be paid as has the employer, but that, as a matter of fact, he fixes the wages for every man employed by his company. (705, 706, 707.)

Mr. DIMOCK says that the wages paid in the sewing-silk mills have steadily advanced during the last 50 years and are now fully 100 per cent higher than they were 50 years ago. Most of the work done by the women is paid by the piece. Most of the men work by the day. The wages of the girls employed by the Nonotuck Silk Company average \$7.50 a week; the wages of the men average \$12 a week. All of the employees are paid in cash. (694, 696.)

4. *Hours of labor.*—Mr. DIMOCK says that the employees of the Nonotuck Silk Company work from 6.50 a. m. to 12 o'clock noon and from 1 p. m. to 6 p. m. All women and all minors under 18 quit work at 3 p. m. on Saturdays, as the law limits the labor of women and minors in factories to 58 hours a week. The men employees work 60 hours a week, and stop at 5 p. m. on Saturdays. The hours of labor for State, county, and city employees are shorter than for the employees of manufacturing establishments. Forty years ago or more the workers in the silk mills worked on an average 12 hours a day throughout the year. They worked from daylight to dark, and on the longest days in summer worked 14 hours. The men occasionally work over time for repairs. On account of the law limiting the hours of labor of women and minors to 58 hours a week, these employees do not work over time. (694, 695.)

Mr. WEIDMANN says that the workmen employed by the Silk Dyeing Company work 55 hours a week. There is a separate shift of workmen for night work, who come on at 6 o'clock in the evening. In Switzerland the workers in the silk dyeing mills work 10 hours a day, or 60 hours a week. (705.)

5. *Employment of women and children.*—Mr. ANDREAE says that in the Pennsylvania silk mills more women than men are employed; in Paterson, as in all of the older silk centers, more men than women are employed. (693.)

Mr. CHENEY says that about 45 per cent of the employees of Cheney Brothers are men and about 55 per cent are women. (729.)

Mr. HUXER says that children under 15 years of age, mostly girls, are employed in throwing and spooling. Men are employed especially in weaving. The employees of the New Jersey silk mills are two-thirds men and one-third women. In Pennsylvania, however, only one-third of the workers are men and two-thirds are women. (676.)

XIX. PLUSH TRADE.

A. Development of plush manufacture.—1. *History.*—Mr. JOHN HOWEELL, a manufacturer of Boston, Mass., says that previous to 1838 all mohair car and furniture plushes were imported. Previous to 1881 two unsuccessful attempts had been made to establish the plush industry in this country. In 1881 the Goodall Brothers of Sanford, Me., began experimenting, with a view to manufacturing mohair plushes. The first loom was a failure, but in the spring of 1883 they were able to place on the market what was known as crushed furniture plush. It was not until the summer of 1884, however, that they were able to place upon the market mohair plushes satisfactory to the American consumer. From 1884 to 1887 constant improvements were made in the looms, and the cost of manufacturing was reduced. From 1887 up to 1892 an enormous amount of mohair plush was made in this country, but about 1892 that fabric practically went out of use, and the plushes which are now manufactured are nearly all car plushes, jacquard pattern, high pile and low pile. A limited amount of crush plush is manufactured.

During the years from 1887 to 1892 a considerable number of factories for the manufacture of plush were established in this country, and there is strong competition in the industry. (521, 522, 523.)

2. *Benefit to consumers.*—Mr. HOWEELL says that the establishment of the plush industry in this country and the consequent development of home competition have resulted in reducing the price of plush to the American consumer 33, or 40 per cent, possibly more. The McKinley law stimulated production, and there are more looms in the country to-day making mohair plush than can be run profitably. The fall in price has not affected quality of the goods. (523-526.)

B. Conditions of capital and business.—1. *Sanford mills.*—Mr. HOPEWELL says that the Sanford mills manufacture plushes, carriage robes, horse blankets of all kinds, and army blankets. They also manufacture linings for cheap coats, ducks, and drills. The mills employ from 375 to 400 hands, and manufacture probably about 75 per cent of the goods produced in their line which are manufactured in this country. (523, 526.)

2. *Foreign competition.*—Mr. HOPEWELL says that as soon as the Sanford mills, through their representatives, L. C. Chase & Co., entered the market in competition with foreign manufacturers of plush, the foreign makers reduced their prices to the American jobbers, and continued to make great reductions in price for the 3 years following the beginning of American competition. As there had been no change in the cost of mohair, this reduction in price was caused wholly because of the competition of American manufacturers. The foreign manufacturers were disposed to make the United States the dumping ground for their surplus product. In addition to that, there was great undervaluation of the imports of plush. If there is to be competition it is better that it should be domestic competition. In addition to the disadvantage which the American manufacturer has from the undervaluation of imports and from the sending of surplus products to this country regardless of price, he is at a disadvantage, because labor in other countries is cheaper than it is here, while the expenses of manufacturing are substantially the same for all American competitors. (523, 524.)

3. *Effect of tariff reduction.*—Mr. HOPEWELL says that under the so-called Wilson law the business of the Sanford mills declined greatly. This was due largely to the general depression of business. Still, there was quite a little importation of foreign robes and foreign plushes. (523.)

4. *Raising of Angora goats.*—Mr. HOPEWELL says that the establishment of the plush industry in this country has led to the breeding and raising of Angora goats. The raising of these goats has increased very rapidly in this country during the last few years. (523.)

C. Conditions of labor.—1. *Wages.*—Mr. HOPEWELL says that the weavers employed by the Sanford mills are paid from \$9 to \$10 per week, the average being probably \$9.50 per week. The spinners are paid from \$5 to \$6 per week, according to the number of spindles tended. Last year the Sanford mills increased the wages of its employees from 10 to 15 per cent. There had been a reduction of 5 per cent in wages after the Wilson law went into effect. In Germany weavers are paid from \$5 to \$7 per week. (523, 526.)

2. *American and European workmen compared.*—Mr. HOPEWELL says that the productiveness of the foreign laborer in the plush factory is about the same as that of the American laborer. There is no question but that there is a difference in the productiveness of American and foreign workmen in some industries, but in the plush industry the productiveness is substantially the same. The productiveness depends on how the machinery is speeded. If the machinery is speeded the same in the two countries the result will be the same. (526.)

XX LINEN THREAD TRADE

A. Conditions of capital and business.—1. *Linen Thread Company.*—Mr. WILLIAM BARBOUR, president of the Linen Thread Company, says that the Linen Thread Company was formed for the purpose of distributing more economically the product of 4 different linen-thread mills. These mills employ about 4,000 operatives, three-quarters of whom are women. The Linen Thread Company simply sells the products of these mills. It did not purchase the separate mills, and the original owners have the same relative interests in the properties which they had before the Linen Thread Company was formed. The company manufactures a little, though very little, on its own account. It also imports large quantities of linen linings. This is not properly a part of the thread business, but it is done because some of the most important customers of the company purchase these linings. The Linen Thread Company also took over the business of several of the selling agencies of foreign manufacturers. (723, 724.)

2. *Advantages of combination.*—Mr. BARBOUR says that by the formation of the Linen Thread Company 90 per cent of the bad debts of the companies whose products it sells have been eliminated. The company is also enabled to carry stocks in different localities all over the country, in many of which localities the separate concerns could not afford to keep a representative and to carry on business. (725.)

3. *Competition.*—Mr. BARBOUR states that there are four concerns manufacturing linen thread which are not represented by the Linen Thread Company. These

independent mills compete strongly with the Linen Thread Company, and their competition is increasing. There has been no advance made in the prices of the goods handled by the company since its formation. (726.)

4. *Importation of flax.*—Mr. BARBOUR says that all the flax used by the Linen Thread Company is imported. The company imports a large amount of flax from Canada in the rough state, and also imports a great deal of what is known as hackled flax—that is, flax from which the tow has been removed. It is more profitable to import the combed flax and sell the tow in Ireland, have it spun there, and import the yarn, than it would be to import the uncombed flax, comb it here, and attempt to sell both the yarn and the thread here. There is not sufficient protection on yarns to warrant their manufacture in this country. (724.)

5. *Consumption of linen thread.*—Mr. BARBOUR says that the amount of linen thread consumed in the United States equals the consumption of linen thread in all the rest of the world. More carpet yarn is sold in Philadelphia than is consumed in the whole of Great Britain. (724, 725.)

6. *Import and export trade.*—Mr. BARBOUR says that nine-tenths of the linen thread consumed in this country is manufactured here. Nearly all of the thread used in the manufacture of fish nets, however, is imported. This fact is due in large measure to the prejudice of the fishermen, who have an idea that a certain brand of thread will catch fish, and that other brands will not.

Mr. Barbour says that no linen thread is exported. (724.)

7. *Effect of tariff legislation.*—Mr. BARBOUR says that the linen-thread industry would never have been established in this country except for the protective tariff. If the tariff duties should be repealed or lowered it would result in the transfer of the linen-thread industry to foreign countries. The tariff is needed, not on yarn thread, but all along the line. Increased consumption of goods results from our tariff policy. Two years of a free-trade administration would cause the consumption of thread in this country to fall off 75 per cent. (725.)

B. Conditions of labor.—1. *Nationality.*—Mr. BARBOUR says that nearly all of the employees in the factories of the companies represented by the Linen Thread Company have come from Scotland and Ireland. (724.)

2. *Wages.*—Mr. BARBOUR says that the spinners employed in the mills of the Linen Thread Company are paid from \$1 to \$1.10 per day. The wages of the spinners in Belfast, Ireland, are about 85 cents per day.

Some of the girls employed in the linen-thread mills at Paterson have as much as \$2,500 deposited in the savings bank, and many of the employees own their own homes. (724.)

3. *American and European operatives compared.*—Mr. BARBOUR says that exactly the same kind of machinery is used in the linen-thread mills in Ireland as is used in this country; it is speeded just as high, and the operatives produce just as much in a day as do the operatives in this country. It may be true that in many industries American operatives are more efficient than operatives employed in similar industries abroad, but it is not true in regard to the linen-thread industry. (724.)

4. *American and European conditions compared.*—Mr. BARBOUR says that the condition of the operatives in this country is much better than is the condition of operatives abroad. Foreign operatives are anxious to come to this country, and none who come wish to go back. (725.)

XXI. CLOTHING MANUFACTURE. SWEAT SHOPS.

A. General conditions of labor.—1. *Extent of sweating system.*—Mr. REYNOLDS, head worker of the University Settlement Society, says that the statement is made that there is not a garment-making establishment on Fifth avenue, from the lowest to the highest, that does not send its work to the tenement houses. If one leaves one's measure with a first-class tailor, he has no assurance that the work will not be done in a sweat shop. The union label of the tailors' union is no guarantee against it. The garment manufacturers were to a large extent favorable to a law requiring the licensing of work done in the tenement house; but they opposed the provision of the law which requires that every manufacturer and every contractor shall file in the factory inspector's office a list of the names of the persons who worked for him, and that every worker shall file a statement of the parties for whom he works. The makers of first-class garments desire to conceal the fact that they use the sweat shop. Mr. Reynolds estimates that the sweat shops do about four-fifths of the garment-making work. (88, 89.)

Mr. Reynolds says that the attempt was made about 5 years ago to strengthen the clothing manufacture in factories as against manufacture in small sweat shops and in private apartments. The attempt has not succeeded. The introduction of electrical machinery and other motors for running sewing machines

has proved an obstacle. Two of the largest cloak manufacturers in New York have just retired from business, saying that they can not compete with the small shops of the East Side. The reasons given are that the small shop can make up a small lot of goods in a greater variety of styles for the western customer, and that it can rush through a small order on much shorter notice than the large factory has to have for filling its larger orders. (83.)

Mr. BROOKS, president of the National Consumers' League, says that dress suits and high-priced cloaks come out of the sweat shops. In ordering clothes at any first-class tailor shop on Fifth avenue, one has no assurance where or how they will be made. All the leading tailors in Chicago have a large part of their work done in sweat shops. There is not a department store in New York that has not tons of sweat-shop goods in it. Vast quantities of clothing for use in the Army are reported by investigators to have been made in such places. (131-135.)

Mr. Brooks says that the Massachusetts law, since it has become effective in diminishing the evils of the sweat shop in Massachusetts, has driven them to New York. Roughly, \$120,000,000 worth of goods are made in sweat shops in New York, and probably not more than \$23,000,000 worth in Massachusetts. The abuses of the sweating system center in New York City and the surrounding regions on Long Island and in New Jersey. (129.)

Mr. HUGHES, deputy factory inspector of Pennsylvania, says that most of the fine merchant tailoring of Philadelphia is done by home workers under slum conditions. Mr. Hughes does not know of a custom-tailoring establishment in Philadelphia that has a shop on its premises. A coat which it would cost \$7 to make in a shop is made by home workers for \$3 or \$3.50; one which would cost \$12 in a shop is made in the homes for \$7 or \$8. Mr. Hughes once found a coat, which had been ordered by a prominent official of the city of Philadelphia, being made under very unclean conditions. While Mr. Hughes was explaining to the workman the necessity of greater cleanliness, he discovered a goat under the table; and downstairs he found more goats. The man told Mr. Hughes that the goat was a member of the family. His permit was withdrawn. Mr. Hughes has found ladies' garments ranging in price from \$25 to \$50 in a house where a child was sick with diphtheria. In another place, lying on the bed of a child sick with diphtheria, he found about 125 pairs of children's pants. (257-260.)

Mr. LAPPIN, deputy factory inspector of Pennsylvania, says that when a man orders a first-class garment, supposing that it is to be made by a first-class workman, he has no security that it will not be made in a sweat shop. Mr. Lappin himself has ordered a \$25 business suit, and has found the coat of it in the hands of an Italian, who said that he was to get \$3 for making it. At least \$5 to \$7 ought to have been paid for making such a coat. Mr. Lappin remembers, among goods that have been destroyed in accordance with the sweat-shop law, silk waists, ladies' wraps, custom-tailoring goods, and one overcoat worth about \$65. Mr. Lappin thinks that four-fifths of the custom-made goods are made in private houses. (249, 250, 262.)

Mr. DIXON, a merchant tailor of Philadelphia, objects strongly to the statement that no tailoring establishment in Philadelphia has a workshop connected with it, and that one can not be sure, in ordering an expensive garment from any merchant tailor in the city, that it will not be made under filthy and unwholesome conditions. He declares that he has working rooms connected with his own establishment, and he knows that other tailors have. He does not intend that any work which he gives out shall be done under bad conditions. He depends for protection in this respect very largely upon the State inspection of places where clothing is made. He was president of the Merchant Tailors' Association of Philadelphia when the inspection law was passed and put into operation, and he did all he could to help the inspectors.

Mr. Dixon implies that the work done in his shop is largely repairing. He says that workmen prefer to work in their own homes; it has always been a habit of the trade, and there is a prejudice against change which would have to be overcome before the factory system could be introduced. Moreover, the conditions of the trade make factory work almost impracticable. During September, October, November, and the first part of December there is a great press of work; during July and August and January and February there is scarcely anything to do. It is necessary for a man to work very long hours in the busy season in order that his wages may carry him over the dull season. The factory system, applied under the customary factory laws, would restrict their employment to perhaps 60 hours a week. It would also put an end to that individuality in the production of garments which is the distinctive mark of the true tailoring trade. Though the work is home work, it ought not to be classed as sweat shop or slum work. Conditions are probably better in Philadelphia than in Chicago or New York. There is more tenement life in New York and less in Philadelphia. Many Philadelphia

workmen, including some of Mr. Dixon's, own their own houses, and have neat rooms set apart for their work. They are prosperous, their children are clean, their houses are tidy; better conditions could not be obtained. Mr. Dixon has sometimes suspected, when one of his workmen has brought back a completed garment, that he himself had not made it, but that he had farmed it out and taken a profit on it. A skillful cutter can detect a thing of this sort, because he knows the individual qualities of the work of different men. When an employee is suspected of having played such a trick he is dropped. (281-285.)

2. *Distinction between sweat-shop work and home work.*—Mr. MILLIGAN, formerly factory inspector of Pennsylvania, makes a distinction between sweat-shop work and home work. Ready-made clothing, he says, is made under sweated conditions. In the tailoring industry proper, there are Italian, German, Irish, and English tailors who have learned the trade and are able to make a complete garment, but who get the clothes from the merchants and manufacture them in their homes. It is doubtful, however, whether these tailors would prefer to work in shops attached to the establishments they work for, even if the shops were furnished. There are only two seasons in the year, the spring and the fall, and they must work hard while they do work. Yet these goods ought to be made in what is called the back shop. There are several such back shops attached to tailoring establishments in Philadelphia, where work is done under proper conditions. (254, 255.)

Mrs. SYMONDS, labor editor of the Philadelphia Inquirer, distinguishes sweat shops from home-working places as they now exist in Philadelphia, to the disadvantage of the latter. It is the home worker, she says, that is now a menace to the community. The sweat shops used to exist under conditions very similar to those which now surround the home workers, but by the good factory inspection law of Pennsylvania and the efficient enforcement of it, this has been largely done away with. The sweat shops, with which Mrs. Symonds is now acquainted, are well lighted, well ventilated, airy places. In the homes of the immigrants, work is carried on under conditions of repulsive filth. (261, 262.)

3. *Wages.*—Mr. REYNOLDS says that in factory work, in the garment trade, wages would range from \$5 or \$10 a week for the operator's assistant; up to \$15 or \$18 a week for operators and pressers, and for other workers, from \$15 up even to \$25. These wages might sometimes be made in the homes of the workers, but the home workers are, as a rule, the least skilled. The more skilled workers are found in the small shops, and the most skilled workers in the large factories. (83.)

Mr. Reynolds thinks that the sweat-shop worker, working 10 hours a day, can probably earn \$10 a week. Where the work is done in the homes the children may assist, but child work is not a considerable evil in this connection. (90.)

Mr. DIXON says that a coat maker in that city, a skilled tailor, can earn from \$20 to \$40 a week during September, October, November, and the early part of December, according to his skill and the hours he works. A trousers maker would probably earn from \$12 to \$25 a week. During this busy season, however, men work very long hours; sometimes from 6 or 7 in the morning until midnight. (288-285.)

Mr. HOURWICH says that in the tailoring trade in New York City it is quite customary for an employer to withhold the payment of a portion of the wages as security that the employee will not leave him before the expiration of the agreed term. This is practised especially in regard to cutters, who may leave an employer in great embarrassment if they desert him in the height of the season. (156.)

4. *Hours of labor.*—Mr. REYNOLDS says that the secretary of one of the garment workers' unions, 3 or 4 years ago, showed him a list of 125 members of the union, out of whom he mentioned by name 16 who he knew were working 12 hours a day; 8 who were working 14 hours; 6 who were working 18 hours, and 4 who were working regularly 20 hours. These hours were kept in shops which were only shops, or in shops which were residences and shops at the same time. The men who were working 20 hours had come to this country alone and were anxious to bring their families over. Probably they would not work such hours more than one season; but the effect of it on the general trade is very bad, because they do not get wages commensurate with the length of time they work, and consequently the practise encourages the employers to extend the hours of labor and to cut down the wages. (84.)

5. *Manufacture of army clothing.*—Mr. BROOKS testifies that the English Government does not make any contracts for the manufacture of garments without provisions which make it certain that the work will be kept out of sweat shops. Garments bought by the Government are made in London in some of the finest factories, working eight hours, with up-to-date machinery, and good light. The post-office department of Canada has decided that every contract shall contain provisions which shall make it impossible to farm it out. Mr. Brooks contrasts

the policy of our own Government, with its sweat-shop army clothing, to our disadvantage, with the policy of England and Canada. (185.)

Mr. LAPPIN says that 2 years ago as many as 8,000 women were employed at their homes making army clothes for the United States Government, and that besides as many as 60 contractors were doing similar work and sending it into the slums of Philadelphia. The factory-inspection department of the State induced the Government, through the commanding officer of the United States arsenal, to insert in its contracts a clause providing that all work must be made and finished in the building to which it was taken, and must not be given out under any conditions. As a result of this, Mr. Lappin declares that there is not now a single piece of army clothing being made in the slums of Philadelphia. These goods are now made in factories. Mr. Lappin speaks, however, of the khaki suits of the Government as having been made for a time by regular employees in Philadelphia and afterwards sent to New York because they could be done for 90 cents in the New York sweat shops, while it cost \$1.15 to make them in Philadelphia. (249.)

6. *Evils of sweating system.*—(a) *General discussion.*—Mr. BROOKS mentions as one of the evils of the sweat shops the throwing of the rent, which the employer ought to pay for a working place, upon the laborer. In the modern city rent is an item of vast importance. Another evil is the seasonal character of the trade. There are periods of idleness alternating with excessive work. During the boom season the work goes on steadily 14 or 15 hours a day. This alternation of excessive work and idleness would be diminished if the trade could be brought under the factory system. Again, the physical exhaustion involved in home methods of production is enormous. The woman or the child running a machine by foot power has to follow a pace of production which is set by machinery propelled by steam or electricity. The testimony of physicians is that it is rare to find a healthy person who has been engaged 4 or 5 years in such work. Further, besides the evil to the workers, there is the danger to the health of the whole community from the filth and the disease of the sweat shops. Even in Massachusetts, where the law is probably better enforced than anywhere else in this country, it is constantly necessary to withdraw sweat-shop licenses because of filth or actual disease. Diphtheria and typhus are constantly found in sweat shops, even where they are inspected, and to a far larger degree, of course, in those which are not inspected or are poorly inspected. Finally, the system is characterized by pitiful wages. During the boom season the poor people slave to the utmost to get the largest possible amount of work. During the dull season great numbers of them are dependent upon charity. (129-133.)

(b) *Sanitary conditions. Contagious diseases.*—Mr. MILLIGAN finds the greatest evil of the sweat shops in their filthy and unsanitary conditions. He declares that clothing in the process of manufacture has frequently been spread on the floor for persons to sleep on, and vermin are often found creeping over the garments. He mentions having found a dress coat, designed for a prominent and distinguished gentleman of Philadelphia, in the hands of an Italian, with a filthy, naked baby crawling about him, two or three boys looking after little details of the coat, and half a dozen spring chickens running about the floor. (252, 254.)

Mr. REYNOLDS states that the State Tenement House Commission, of which he is a member, recently examined the apartments of 697 workers in the sweated industries. Of 15 flower workers, 4 were found in unsanitary apartments; of Italian garment workers, 78 out of 205 in Manhattan, and 10 out of 108 in Brooklyn; and of Russian and Polish workers, 8 out of 118 in Manhattan, and 5 out of 99 in Brooklyn, were found living under unsanitary conditions. Ten out of 15 of the flower workers; 12 out of 41 necktie workers; 118 out of 205 Italian garment workers in Manhattan, and 88 out of 108 in Brooklyn; 18 out of 118 Russian and Polish garment workers in Manhattan, and 5 out of 99 in Brooklyn, used the working rooms as sleeping rooms. The unsanitary conditions, including overcrowding, are partly due to the habits of the immigrants and to the conditions under which they have been brought up. The Italians are the worst, especially in respect to overcrowding. Out of 205 apartments in Manhattan occupied by Italians, 58, and out of 108 in Brooklyn, 17 contained more than one family. Among the Jewish workers there were only 8 such cases out of 118 in Manhattan, and only 2 out of 99 in Brooklyn. (85.)

Mr. Reynolds says that he has seen an apartment where garment making was going on in the front room, while the garments were piled and kept in a dark back room in which a man lay on a bed, apparently in the last stages of tuberculosis. In many instances he has found garments on the floor and the floor filthy; he has found the rooms dark, the ventilation bad, and the gases at times coming up from defective plumbing. Vermin always abound. (88.)

Mr. LAPPIN mentions a case in which diphtheria appeared in the house of a woman who was making clothes at home for the United States Government.

Being anxious to get the work finished, she induced another woman to take it home and complete it. In 10 days diphtheria appeared in the other woman's house. The State permits of both of these women, permitting them to do work in their houses, were revoked, and repeated requests for renewal of them have been refused. (251.)

7. *Frauds on workers.*—Mr. HOURWICH says that the great complaint in the sweat-shops of New York is that the workman can not be assured of his pay. The large warehousemen, as they are called, only keep designers and cutters. They send out the work to subcontractors. The subcontractor may have money enough to pay a month's rent, or he may borrow even that from the warehouseman. He probably has no money to buy sewing machines, though machines can be bought for \$10 apiece. He rents his machines. He is entrusted by the warehouseman with perhaps \$1,000 worth of work. He delivers the work. It is passed upon by the examiner, and if it is found satisfactory he gets a check. Very often he makes away with the check. Workmen have worked for weeks and are left without a cent for their families. The law gives them no redress. There is a provision for an artisan's lien, but in order to be protected by it the workman must keep possession of the work until he gets his pay. He can not do this under the conditions of the trade. New York has a law to protect workingwomen, which makes an employer who fails to pay the wages of his female employees liable to arrest if an execution is returned unsatisfied; but this does not apply to workingmen.

The United Brotherhood of Cloak Makers has overcome this trouble to some extent, by inserting a provision in its contracts with the manufacturers, making them liable for loss of wages resulting from the insolvency of the sweat-shop bosses or contractors. This has worked very efficiently. In some cases the manufacturers who are so bound take pains to ascertain the financial responsibility of their contractors; in other cases they take deposits from the contractor, or retain a certain portion of his pay until they are satisfied that the hands are paid. But outside this particular branch of the tailoring trade, and outside of those factories which are under the union rules—and they are not the majority—the workers have no security. In the great majority of the tailoring establishments in New York city, which employ 50,000 workmen or more, there is no certainty that the wages that are earned will be paid. (142, 155, 156.)

Mr. BROOKS mentions, as one type of gross fraud which the sweating system makes possible, advertising for workers to learn some special work, getting several days' service for little or nothing, and then turning the people off with some excuse, such as that the sewing is not up to the mark. In this way the sweater constantly loses his women, but is able to cheat a succession of victims. (136.)

B. Foreign-born in sweat shops.—Mr. MILLIGAN says that recent immigration has revolutionized clothing manufacture. There used to be a number of Germans in Philadelphia who manufactured ready-made clothing in well-kept shops. They have been nearly wiped out. The lower class of immigrants come here without any means of livelihood, and are forced to seize upon the first employment at which they can earn a living. They can learn very quickly to run a sewing machine and manufacture clothing. These people are entirely lacking in cleanliness and have no sense of what conditions are decent for such manufacture. They soon become manufacturers or contractors themselves, and their competition with each other crowds down the prices of work. (258.)

Mr. HUGHES testifies that he has official charge of the slum district of Philadelphia, which is chiefly filled with tenement houses, inhabited mostly by immigrants. The prevailing nationality he thinks to be Russian. The chief industry is the manufacture of clothing. This is largely carried on in the homes of the people, and men, women, and children are employed at it. The majority of the workers have learned the trade after immigrating to this country. They often go on arrival to some friend or relative who is already in the business and who has brought them from Russia. Occasionally they become bosses immediately. Mr. Hughes recently found a family which had been in the country only two weeks, the head of which was already a boss, manufacturing children's pants. The boss sets apart a room in his home for working, rents two sewing machines at \$3 a month apiece, and gets an iron and a board to press on. Then he goes to the store and gets clothing, takes it to his home and manufactures it. The bosses underbid each other mercilessly in the price of work and so cut down the rate of wages. (257.)

Mr. REYNOLDS says that until some 15 years ago the garment-making trade in New York was largely in the hands of the Irish women and German men. While some work was done in the homes, more was done in the shops than is the case now. When the Russian and Polish immigration came, the immigrants wanted some trade which they could acquire easily and exploit quickly. After working 2 weeks at the garment-making trade one can begin to get small wages as an operator's assistant. There is scarcely any other occupation, except unskilled labor,

at which one can begin to earn wages so quickly. So the Jewish immigrants have turned into this trade more largely than into any other, and each succeeding batch of immigrants has tended to lower the conditions established by the previous batch. The Germans have been largely driven from the trade, and the work is almost exclusively done in small shops and in the homes of the people. (83, 85.)

Mr. BLAUSTEIN says that one reason of the turning of the Jews into sweat shops is their religious scruples. If they go into a factory they must work on the Sabbath. They prefer remaining true to their religion to getting work. There are individuals who take advantage of this conscientiousness and offer to provide them with work which they can do at home and do when they please. Mr. Blaustein believes that the Sabbath question has more to do with the crowding of the Jews into sweat-shop work than their poverty. He believes, however, that there are more Italian than Jewish sweat-shop workers, though the Sabbath question does not trouble the Italians. (120, 121.)

C. Labor organizations.—1. *Efforts to abolish sweat shops.*—Mr. BROOKS says that the United Garment Workers are working against the sweat shops under enormous difficulties. They are trying to use their label on goods that are not made in sweat shops. If they were powerful enough to enforce their demands, they would help very greatly in the abolition of sweat-shop work, but they are not strong enough. The sweat-shop workers themselves are too weak and helpless to organize completely enough to control the abuses. Even the label of the Garment Workers gets put on sweat-shop work. (134.)

Mr. LAPPIN says that while the labor organizations are in some degree active in the attempt to regulate the sweat shops, they are handicapped because no individual wants to take an active part for fear of being boycotted by this or that particular house. Union men are violators of the regulations along with the rest. They are brought to it by the conditions existing. (251.)

2. *Attitude of employers.*—Mr. DIXON has always refused to deal with a union, and he gives as one chief reason the loss of individuality in work which would result from putting all tailors on one level. The product of the tailor is an individual product and has its individual qualities. Mr. Dixon would not be willing to admit that all men can do the work equally well and should have the same pay. He does not know that any effort has ever been made by the Journeymen Tailors' Union to substitute shop work for home work in Philadelphia. (283, 284.)

D. Existing laws for inspection of sweat shops.—1. *Pennsylvania.*—Mr. HUGHES submits a copy of the sweat-shop law of Pennsylvania. It governs the manufacture of certain named articles of dress, as well as that of purses, feathers, artificial flowers, cigarettes, and cigars. It provides that no room in any tenement or dwelling house shall be used for the manufacture of these goods, and that no person shall be employed to work in any room or building at making any of them, in whole or in part, until a written permit has been obtained from the factory inspector, fixing the maximum number of persons that may be employed therein, and stating that the building or part of the building intended to be used for such work is thoroughly clean, sanitary, and fit for such work. The permit shall not be granted until the premises have been inspected by the factory inspector or one of his deputies. It may be revoked whenever the health of the community or of the people employed requires it. Persons who contract for the manufacture of any of the articles named are forbidden to make such a contract or to give out material for such work without the production of the permit. They are required to keep a written register of the names and addresses of all persons to whom such work is given, and to produce it on demand of the factory inspector or any of his deputies. Two hundred and fifty cubic feet of air space is required for every person employed. Violation of any provision of the act is punishable by a fine of not less than \$20 nor more than \$50 for the first offense; not less than \$50 nor more than \$100 for the second offense, or imprisonment not more than ten days; and for a third offense by a fine of not less than \$350 or not more than 30 days' imprisonment. The factory inspector or any of his deputies may seize and destroy any clothing that is being made in any unsanitary place or where there is contagious or infectious disease.

The great weakness of this law Mr. Hughes thinks to be in the provisions for the enforcement of it. There ought to be about 20 inspectors in the city of Philadelphia; there are only 7. The home workers ought to be constantly watched, and it is impossible at present to visit their homes more than once a year. Criminal process under the act should be more expeditious. The magistrates have authority only to hold violators in bail to appear at court. Sometimes the cases drag along in court 5 or 6 months before there is a hearing. Meantime sweating is going on in the old way. It would be better if the magistrate had power to fine.

Mr. Hughes says that he has himself seized some 1,500 garments found in unsanitary places and had them destroyed; though it appears from his later testimony that the garments were turned over to the board of health, and that some of them at least were not destroyed, but only fumigated. (258-260.)

Mr. LAPPIN believes that the present law of Pennsylvania, and particularly the recent amendment which empowers inspectors to seize, confiscate, and destroy goods found in process of manufacture in unsanitary places, or places where contagious diseases exist, has been a most effective sweat-shop law, and has produced excellent results. Every person who manufactures in his home the goods designated in the law, must obtain a permit from the factory inspector, and the manufacturer is required to demand the production of the permit before giving out work. The health law requires the physicians of Philadelphia to report to the bureau of health every case of contagious disease. By the courtesy of the city government the bureau of health submits to each factory inspector a list of such cases. This enables the inspectors immediately to detect any places which hold home-work permits and in which contagious disease has appeared. If goods are found in process of manufacture under such circumstances the board of health is notified and the goods are sent for and fumigated. If any case is found where work is being done without a permit the inspector has authority to order the goods destroyed; and goods have been destroyed under this law. Such destruction of the goods is a far more effective penalty than arrest would be. The law would be much more effective if the number of inspectors were increased. Mr. Lappin's district includes 70 sweat shops, over 200 factories, and about 8,000 homes in which work is done. He is able to inspect the factories only about once a year, and the sweat shops scarcely oftener. Once a year would do very well for the factories, but the sweat shops ought to be inspected once a month. There should be 3 men in Mr. Lappin's district instead of 1. The number of inspectors actually employed is 20 in the State, and 7 in the city of Philadelphia. (248-251.)

Mr. MILLIGAN says that during his experience as inspector in Pennsylvania, from 1895 to 1897, there were only a few places that could properly be called sweat shops. The work was done in the homes of families, in rooms that ought to be used only for living purposes. The law, when he was inspector, provided that none but a member of the family could work in a house. Under this law the inspector directed a considerable number of people who were working in unsanitary homes to do their work in shops where the conditions were better. But many very soon went back to home work, declaring that at the prices they got it was impossible for them to pay shop rent. The law was afterwards amended so as to give the department the right to inspect homes in which work is done. (252.)

2. *New York.*—Mr. REYNOLDS says that the inspectors who are charged with the care of sweat shops in New York have been accused of neglecting their duties from corrupt motives; but the only attempt which has been made to prove anything of the sort resulted in failure. Mr. Reynolds attributes the lack of efficient inspection to the inadequacy of the inspecting force. On September 1, 1899, a law came into operation requiring the licensing of all working places in tenement houses in which garment making, cigar and cigarette making, etc., are carried on. The department was swamped with applications. About 12,000 licenses have already been granted. In a single street, about 8 blocks long, 999 licenses were granted from September 1 to January 1, while only 953 such licenses were granted in the whole of last year in the whole State of Massachusetts. If the law could be adequately enforced it would greatly diminish the evil conditions, at least in New York. This has been the effect in Massachusetts, where the law is enforced. (86.)

Mr. BROOKS says that it is absolutely impossible to get any proper inspection of the sweat shops of New York. Politics interferes with it, and public opinion does not efficiently demand it. It is not even possible to obtain the information which the law requires manufacturers and contractors to furnish. The law gives properly authorized persons the right to know to what houses a contractor sends goods. It has not been found possible, by any device which the Consumers' League can control, to get at these names. (129, 130, 137.)

E. Proposed legislation and remedies.—1. *General discussion.*—Mr. Brooks believes that if all manufacturers were required by law to adopt the factory system, and if the law were enforced, the sweating evil would be practically cured. He does not believe that such a change would, in the long run, increase the cost of garments to the consumer. Sweating puts a check upon the improvement of methods and of machinery. There are some large manufacturers who do not use the sweat shops, and others use it only when the busy season is on. Mr. Brooks has a collection of garments of almost every type which were

made under splendid conditions at prices not higher than those of the sweated goods. Some of the very cheapest things on the market are made in excellent factories. But an industry that has been sweated—as, for instance, the English boot industry—drags along for a long time before the most intelligent men in it find that sweating can be abolished; and so long as surplus labor can be exploited by small and unscrupulous contractors, it is very difficult to introduce a better system.

Yet Mr. Brooks does not wish to raise the question, as a practical one, of forcing the whole manufacture into factories. It would be a great deal better if it could be done, but it is not yet possible. The thing that he wishes to direct attention to is the taking of certain practical steps, such as have already been taken in Massachusetts. Simply to make it possible for any responsible person to find where any particular manufacturer or contractor has his goods made would be an immense gain. There would be another great gain in the introduction of thorough inspection such as prevails in Massachusetts. A woman who wishes to do work at home for the market must go to the inspector's office and get a permit. An inspector is sent to make an examination, and work is not permitted to be done there unless the home meets the sanitary conditions. (180-185.)

Mr. Brooks admits that if vigorous action were taken in doing away with the sweat shop there might be cases of hardship. The evidence indicates that as the workers drift into factory conditions they get better wages and better hours; but there might be left certain cases of helplessness in the home which would be unfitted to go into the factory. These would have to be taken care of in some other way; but it would be infinitely better even for them. Thousands of them are supported, even now, half by their wages and half by charity. The demands of this residuum upon charitable relief would be distinctly less in the aggregate than the demands that are now made by sweat-shop workers for charitable eking out of their wages. (182.)

Mr. MILLIGAN says that it would be better if all clothing manufacture in sweat shops and in homes could be forbidden by law, and if the whole of such work could be forced into proper shops and factories. Yet he thinks that under proper supervision clothing could be manufactured in homes without any danger of disease or injury to the buyer. To forbid home work would bring hardship on many worthy and deserving widows, who have their children to look after, and who must earn a living for their children and for themselves. The question is whether this large class of good people should be compelled to suffer because of the indifference and want of thought and cleanliness of others. An increase of the inspecting force and more frequent visits of inspection might improve the sanitary conditions under which home work is done. Yet Mr. Milligan admits that supervision over some of the homes of the sweat-shop workers "would amount to nothing unless they could be, after years, educated to a sense of cleanliness." (255, 256.)

Mr. REYNOLDS does not think that the law can directly regulate wages in the sweat shops or elsewhere. He does believe that it is possible to put the work that is now done in sweat shops into factories, and to improve the conditions under which it is done. When the condition of the workers is improved they will more readily combine in their own interest; they will be able to do in the matter of wages what the law itself can not do. (84, 90.)

Mr. Reynolds says that it is doubtless true that the Massachusetts inspection has in some degree driven the sweat shops from Boston to New York, and that a similar enforcement of the law in New York may drive them to New Jersey. But the fight could then be carried on in New Jersey as it has been in New York, and if all the States could be brought to act in harmony there would be a uniform elevation of conditions. Mr. Reynolds does not admit that the objection that the abolition of the sweat shop would throw the workers out of employment has any validity. The garments have to be made, and if the law prevents the making of them under bad conditions, they will be made in factories under good conditions, and substantially the same number of workers will be employed. Even when a single State abolishes the sweat shop, its position in comparison with other States is not altogether disadvantageous. Massachusetts goods have come to be worth about 10 per cent more than New York goods, because it is felt that the Massachusetts goods are more likely to be made under sanitary conditions. The Massachusetts garment maker, however, often sends his goods to New York to be made, and then brings them back and sends them out under a Massachusetts label. (86, 90, 91.)

Mr. LAPPIN says that a law which should prohibit work in homes or in places used as sleeping apartments would work hardship on a few, but would benefit the great majority of the workers and would on the whole be most beneficial to labor. (251.)

2. *National legislation.*—Mr. Lappin says that national legislation is needed to

GOVI INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

deal with sweat shops. The laws of New Jersey on this matter are much less strict than those of Pennsylvania. The result is that Philadelphia clothing dealers send their goods over to Camden or other places in southern New Jersey, where they are made up without any regard to the sanitary regulations or other restrictions which would be imposed by the Pennsylvania law. Many goods are also sent into Pennsylvania from New York City. (250, 251.)

Mr. MILLIGAN says that it has been suggested that Congress might put a tax on each shop used for the manufacture of clothing, and in connection with this tax make regulations governing the shops, making health and cleanliness the paramount condition. It might make the tax so large that the vile places and conditions that exist could not endure it. Mr. Milligan considers that it is perhaps a matter which the States rather than the National Government should take hold of, since these conditions prevail only in certain parts of the country. (254.)

3. *Restriction of immigration.*—Mr. LAPPIN says that proper restriction of immigration would diminish the evils of the sweat shops. There are now very few English speaking shops in Philadelphia. The people that work in such places are principally Russians, with a considerable number of Italians. Many people of tender years who are brought over by their relatives or others work in such places. (250.)

F. The sweat shop and the consumer.—*Consumers' League.*—Mr. Brooks says that the Consumers' League was established first in New York. There are now 23 leagues, and a national organization has been adopted. The League tries to find, by careful investigation, places where garments of all sorts are made under proper conditions. It provides a label, called the consumers' label, to be attached to garments which are made under conditions that it approves. It asks the retail stores to offer these garments to its customers. (120, 137.)

Mrs. SYMONDS says that the label of the Consumers' League is applied only to women's garments. It is a guaranty that the goods on which it appears were made under fair conditions. Several large stores in Philadelphia have been induced to handle goods which bear it. Another part of the work of the League is to secure fair conditions for the salespeople, especially the saleswomen, in stores. The League has a white list, on which it puts the names of firms which provide seats for their employees, and fulfill certain other conditions. (264, 265.)

XXII. BOOT, SHOE, AND LEATHER TRADES.

A. Development of boot and shoe manufacture.—1. *Generally.*—Mr. CHARLES H. McDERMOTT, editor of the Boot and Shoe Recorder, says that the first radical change from the old hand methods in the manufacture of boots and shoes came in 1860 when the McKay sewing machine for sewing soles to uppers was invented and put into use. Later other machines were invented which led to a further development of the factory system. In 1877 the Goodyear machine, which imitates the hand-work method of sewing shoes, was invented. The result of the machine development and of the introduction of the factory system has been increased shoe production, decrease in cost of production, and improvement of quality. (498, 499.)

Mr. McDermott submits tables compiled from the United States census giving the total production of boots and shoes in the United States for the years 1860, 1870, 1880, and 1890, together with the number of establishments, the capital invested, the number of employees, the wages paid, the material used, the average product per employee, the average wages paid, the value of the product per capita of population and the per cent of materials used in the product. He submits also a table giving similar facts in respect to the boot and shoe industry in New England. (499, 500.)

2. *In New England.*—Mr. McDERMOTT says that the leading position of New England in the production of boots and shoes was shown as early as 1860. According to the census figures of that year 58.6 per cent of the total boot and shoe production of the United States was produced in New England. In 1890 the percentage was 63.4. There are now 1,207 factories in the New England States. There is invested in the industry \$54,000,000, and 86,000 persons employed. Boston is the recognized headquarters of the boot and shoe industry. It is possible that in individual cases boots and shoes are shipped to Boston from cities further west, but that is not the ordinary course of trade. New England probably supplies 60 per cent of the boots and shoes sold in the West. It is hard to say whether the shoe industry is growing more in the remote districts of New England or in the shoe centers. There are changes each way. On the whole the factories established in the country districts have been successful.

The wages in New England are the highest average wages per capita paid anywhere in the country, and the product per man is greater. (498, 499, 501, 502.)

B. Conditions of capital and business.—1. *Employers' organizations.*—(a) *New England Shoe and Leather Association.*—Mr. M'DERMOTT says that the New England Shoe and Leather Association is merely a general association, the object of which is to consider any matters of general interest to shoe manufacturers which may come up. It originally contemplated having a shoe exchange in Boston, but that was given up, and the products of New England shoe factories are sold in individual stores. (508, 509.)

(b) *Boot and Shoe Manufacturers' Association of Philadelphia.*—Mr. CROXTON, president of the Boot and Shoe Manufacturers' Association of Philadelphia, says that that association has at present 18 members. There are four or five small Philadelphia shoe manufacturers who are not connected with it. (321.)

2. *Leather manufacture.*—Mr. M'DERMOTT says that there has been a slight quickening of the process of tanning, but no essential change. The new chemical process is a special process for tanning goat skins, while the bulk of the leather used is hemlock-tanned leather, and in the tannage of that there has been practically no change. A steam tannery does not mean that the tanning is done by steam, but simply that a steam engine is used in the performance of the work. Electricity has, it has been claimed, been used to some extent in tanning, but so far as is known it has not been a commercial success. (508.)

Mr. FOERDERER, a manufacturer of glazed kid, says that though wages in this country are higher than elsewhere, leather can be manufactured here as cheaply as anywhere. Mr. Foerderer believes that this is largely through the substitution of improved and scientific methods for the rule of thumb, by which all tanning was done up to a few years ago. He anticipates that foreign manufacturers will ultimately become as wise as we, and will learn to produce leather as cheaply. (318, 319.)

3. *Import trade in leather.*—Mr. M'DERMOTT says that the imports of leather for 1900 amounted to \$8,196,770; for 1899, \$5,750,987. Imported leather is not in any way superior to domestic leather, but some people want imported leather. Our hemlock-tanned leather is superior to imported leather in wearing quality. On the face of things it would seem as though the cost of boots and shoes made from imported leather would be higher because of the duty on leather. As a matter of fact, however, when the duty on French calf-skins was reduced, the French prices advanced by the amount of the reduction. (507, 508.)

4. *Export trade in leather.*—Mr. M'DERMOTT says that our exports of leather have increased considerably during the last 3 years, the exports for 1900 amounting to \$21,297,539. The new chemical process of tannage has tended to increase exportation of goatskins, but not to any great extent, because we need all the goatskins we can get for our own trade. There has been a very large increase in recent years in this country in the use of goatskins. (507.)

5. *Glazed kid.*—Mr. FOERDERER says that he began in 1878 to experiment, trying to produce a leather which should take the place of the imported French kid. For 10 years he made little progress, but in 1889 he succeeded in perfecting a process by which he produced a leather which is superior to the imported article, and which has not only driven French kid out of our own market, but rivals it in France. Mr. Foerderer sells half his product in foreign countries. While Mr. Foerderer considers himself the originator of this process, it is true that the same process was patented in 1884, and that Mr. Foerderer thought it advisable to buy the right to manufacture under this patent rather than to undertake litigation. The name of *vici kid* is Mr. Foerderer's own trade-mark, which he adopted when he had perfected his process. The glazed kid is made from goatskins which are imported from all parts of the world. India is probably the principal producing country, and Arabia the next. Skins are brought from China, South America, and all parts of the world outside of the United States; practically none are produced here. They come from countries where the goats are kept for milking and for meat, as cattle are kept here. Mr. Foerderer has started a little ranch in New Mexico to learn whether goats can be profitably kept there in herds. There is at present a great scarcity of goatskins, and the price of them has risen so that the tanning of them is not at present profitable. The price of the finished product has not gone up proportionately. Sheepskins have been to some extent substituted for goatskins and tanned by the same process. The process is applicable to all kinds of leather except sole leather. The product is superior to the old French kid in possessing a greater ability to bear exposure to weather. Water makes French kid hard and tinney; it does not affect the glazed kid so. The process which Mr. Foerderer uses is being introduced into France and Germany.

Mr. Foerderer supposes his establishment to be the largest of its kind in the world. He has about \$6,000,000 invested in the business, employs about 2,500 hands, and manufactures about 3,000 dozen skins a day. The other manufacturers in the same line are mostly in Philadelphia and Wilmington, though

there are some in Massachusetts. Mr. Foerderer believes that the city of Philadelphia is particularly favorable for the manufacture on account of the character of its water. The same results do not seem to be obtained with the same skins in New England as are obtained in Philadelphia. No leather but glazed kid is produced at Philadelphia. Patent leather is made principally in Newark, and glove leather at Gloversville.

The introduction of the mineral leather process has resulted in a great lowering of prices. The price of Mr. Foerderer's product at present is from 20 to 25 cents a square foot. The French kid which it replaces sold for from 60 to 70 cents a foot. The new leather has come into use for men's wear during the last 3 years. Before that it was used only for children's and women's shoes. (315, 320.)

Mr. SCHÖBER, a shoe manufacturer, says that for his use glazed kid has almost entirely replaced French kid. He considers the American product superior in finish and durability. His sole leather is made from American hides, oak tanned. (345.)

6. *Effect of machinery on shoe manufacture.*—Mr. ELMER P. HOWE, member of the executive committee of the United Shoe Machinery Company, says that the introduction of the Goodyear machinery practically revolutionized the fine-shoe manufacture of the country. There is no occasion to-day for having shoes made to order. Shoes which contain just as good materials and which are just as well made as the custom-made shoes, for which high prices were paid 10 years ago, can now be bought for \$5 or \$6 a pair, and shoes good enough for anybody to wear can be purchased for \$3.50 and \$4. Good shoes are sold as low as \$1.75 and \$2 per pair. The cheapness in cost of production has led the manufacturers to carry in stock a wide range of styles and sizes, so that almost any shoe store can give a customer a better fit than the average custom shoe manufacturer used to give him. The introduction of machinery has brought about an almost infinite subdivision of labor in the production of a shoe. In the larger manufactories each operative does some particular part only, in which he or she becomes very skillful. (486, 487.)

Mr. M'DERMOTT says that shoes are very much cheaper to-day than they were 10 years ago. This is due almost wholly to the introduction of machinery. Machine-made shoes are made of just the same material as that of which hand-made shoes were made and they wear practically as well. (505.)

Mr. COLLINS, a shoe laster, says that in the factory where he works, which makes a very high grade of shoes, one-half or one-third of the shoes, at least on his floor, are made entirely by hand. (307, 308.)

7. *Superiority of American shoes.*—Mr. SCHÖBER says that his firm employs designers continually to get up styles in order to make trade. The American manufacturers lead the world in shoe styles. French shoes look well but they do not wear. "The American shoe combines the grace and beauty of the French shoe with the stability of the English shoe, without the clumsiness which that has." There is a prejudice in England against American goods which is hard to overcome. The sizes sent abroad are about the same as those sold here, except that no foreign country takes so many of the narrow widths as our own market. (344.)

8. *Army contracts.*—Mr. GOODWIN, a laster, complains of the letting of army contracts for shoes to merchants, and the resultant subletting. He complains especially of Mr. John Wanamaker and of his methods of subletting such contracts. He believes that no one should be allowed to take an army contract unless he is prepared to execute it himself. (298, 299.)

Mr. MUNDELL, a shoe manufacturer, who has taken army contracts both directly from the Government and as a subcontractor for department-store dealers, defends the intervention of such merchants. He says that they advance money to handle a large contract which the actual manufacturer might not be able to carry for lack of funds. He has been very glad to have a contract carried for him in this way. He thinks the Philadelphia manufacturers have got about one-fourth of the whole amount of shoe contracts given out by the Quartermaster-General. About one-fourth has gone to a Chicago and about one-fourth to a Maine establishment. (342.)

9. *Competition.*—Mr. M'DERMOTT says that there is active competition in the boot and shoe manufacturing industry, and that there is no agreement whatever among manufacturers in respect to output or prices or wages. The competition is so sharp that it requires great care to make a success. (508.)

Mr. M'Dermott says that the concerns engaged in this country in the manufacturing of boots and shoes are not generally incorporated companies, though the incorporating idea is growing. The employment of larger capital would probably reduce the cost of production to some extent. Still there is so large and so wide a variation in the product of shoes that larger capitalization would not have so very great an effect. Larger capitalization would probably help to increase foreign trade, as it would permit the giving of longer credits. (506.)

10. *Export trade in boots and shoes.*—Mr. M'Dermott states that previous to 1890 our exports of boots and shoes were about \$500,000 or \$600,000 a year. From

that time on there was a gradual increase until the exports in 1897 were \$1,688,649. During the last three years the increase has been very marked, the exports for 1898 being \$1,944,428, for 1899, \$3,668,435, and for 1900, \$4,626,256. The position now secured in the foreign markets is likely to be strengthened in the near future. While it is true that there have been large exports of shoe machinery to foreign countries, nevertheless it will take time for the foreign producers to acquire efficiency in handling the machines.

The principal foreign markets for American-made shoes are Great Britain, Australia, the West Indies, Canada, Mexico, and Central America. Mr. M'Dermott submits a table showing the exports of boots and shoes to other countries during the years from 1897 to 1900. The table shows that there has been a steady gain in most cases. The gain is due, in Mr. M'Dermott's opinion, to the fact that American manufacturers have made more of an effort to push foreign trade than they made in past years. The growth of Western competition, especially, has made it more difficult to sell shoes in the West, and Eastern manufacturers are more willing to look abroad. The tendency is to export the better grades of shoes. (499, 500, 501, 502.)

Mr. M'Dermott says that boots and shoes are sold for export at practically the same prices at which they are sold in this country. American shoes are sold at better prices abroad than they are in this country, because the shoes sold are fashionable fads, so to speak. (503.)

Mr. SCHÖBER says that his firm made its first exports in 1874, to Honolulu. In 1878 Mr. Schöber went through Cuba and the West Indies and worked up quite a trade in those countries, mostly in Cuba. The Cuban trade was held until the rebellion; since that the firm has sent only about \$9,000 worth there. There is no market there now for fine shoes, and Mr. Schöber's firm makes nothing but high-priced goods. The average price of its whole output, including infants' shoes at \$9, is \$34 and some cents a dozen. Special styles are made for the Cuban trade, but for other countries the styles are about the same as for America. The packing is also the same as for the domestic trade. If there is to be a long sea voyage, as to Australia, the cases must be lined to keep out the dampness. About 20 per cent of Mr. Schöber's present output goes abroad. (848.)

Mr. Schöber says that his profits on goods sent abroad are about the same as on goods sold at home. When a duty has to be paid, as in France, "we pay the duty and we add the duty to the price, and we get just as much profit, and we get a profit on the duty because it is part of the cost of the shoe." (843, 844.)

Mr. CROXTON thinks that only two shoe manufacturers in Philadelphia make goods for export. These goods are of very high grade. (832.)

11. *Tariff on hides.*—Mr. M'DERMOTT says that the shoe manufacturers generally regard the duty on hides as a handicap, but in his opinion they exaggerate its effect. The importation of hides is relatively small compared with the total production of this country, the domestic hide production being approximately 90 per cent of the total amount used. Hides have advanced in price, but that is easily accounted for by the great decrease which there was in the domestic supply and by the return of general prosperity. The advance in price was in some cases 100 per cent, while the tariff duty is only 15 per cent. In 1872, when the 10 per cent duty on hides was removed, the price of imported hides advanced by the amount of the duty. It is incorrect to attribute the increase in the price of leather to the placing of a tariff on hides. In any case the percentage of increase in the price of leather would be only one-half the rate of the duty on hides, because the cost of the hide represents approximately only one-half the cost of the leather. The leather in the shoe represents, roughly, only one-third of the value of the shoe, so that by the time the shoe gets to the shoe dealer, assuming that the duty on hides increases the cost, the percentage of increase would be only one-sixth of the rate of the duty on the hide used in the manufacture of the shoe. There has been a general decline in the price of shoes since the duty on hides was imposed. The sentiment in favor of a change in the hide tariff is not so pronounced as it was at first. It was predicted that there would be absolutely no possibility of exporting leather, but as a matter of fact the exportations, both of leather and of boots and shoes, have increased. (506, 507, 509.)

Mr. M'Dermott says that the drawback on reexported hides is a premium to the foreign shoe manufacturer. If the manufacturer here buys the leather made out of the imported hides he does not get any drawback. The drawback is an advantage, however, to the manufacturers of leather. (507.)

Mr. SCHÖBER says that the duty on hides handicaps the export trade a little, though not very seriously; he does not find it an obstacle. He gets a drawback on imported stock that goes into exported goods, but the sole leather is made of domestic hides and there is no drawback on it. "The foreign manufacturer can

buy sole leather in this country 5 per cent cheaper than we can buy it. * * * It is on account of the duty on hides and the rebates." (343.)

12. *Tariff on boots and shoes.*—Mr. M'DERMOTT says that the tariff on boots and shoes has practically no effect on the boot and shoe industry. There has been practically no importations of boots and shoes since the development of the McKay machines. There is a very decided advantage, however, in keeping the tariff on boots and shoes because the time is liable to come when there will be dangerous foreign competition. Canada is now beginning to use shoe machinery largely; Germany, France, and Switzerland are fully equipped with the best machinery. They have a great advantage in the price of labor, and it would be comparatively easy for them to go in for specialties of some kind and to get an opening in this market. (506.)

Mr. M'Dermott says that although the boot and shoe industry would not be affected directly by a revision of the tariff, yet, at the same time, if the removal of the tariff affected other industries, it would have an indirect effect on the boot and shoe industry, as it did in 1894 and 189 . (509.)

Mr. Schober considers the tariff on shoes to be without any effect either good or bad. No foreign shoes could be sold here if there was no tariff, and the American manufacturers sell their shoes in Paris with a tariff 25 per cent against them. Mr. Schober has no fear of any foreign competition, even through the adoption of American machinery. Foreign workmen have not the intelligence to use our machinery. In England the trade unions will not let more than a certain amount of work be done on machines. Even of the Japanese, in spite of their quickness at machine work, Mr. Schober has no fear. He declares that when the Japanese get our machinery and our ways, they will want our wages; and so will any other country where the workmen learn to be as productive as our workmen. (348, 344.)

C. Labor organizations.—1. *Central Convention of Shoe Workers.*—Mr. GOODWIN, a shoe laster, who has worked in the shoe industry for about 17 years, the most of the time in the vicinity of Philadelphia, says that in the fall of 1887 there was trouble between the manufacturers and the employees, and that after a lockout of 5 weeks, the organization known as the Central Convention of Shoe Workers' was formed through the activity of the manufacturers and some of the employees. This organization does not represent the shoe workers. It is not a bona fide labor organization. It has no definite membership. The workers in each factory are supposed to meet and elect delegates, in proportion to their number, to the Central Convention. The witness has never seen this procedure actually followed. When a vacancy occurs, a dozen persons may come together and elect a delegate, but in some cases the delegate seems to be chosen by the manufacturer. Mr. Goodwin submitted the following as a copy of the credentials brought by one delegate to the convention: "J. O'Connell is no longer in our employ. The bearer, Mr. Davis, will act as the representative of our shop. Kindly let us know how much we owe. Yours, truly, P. T. Hallehan." Mr. Hallehan was a shoe manufacturer. The witness says that it has been asserted that Mr. H. L. Townsend, a manufacturer, and secretary of the Manufacturers' Association, has sent credentials similar to Mr. Hallehan's. Mr. Goodwin also mentions an instance in which a person elected a delegate to the Central Convention retired from the position on being informed by his employer that the employer desired another person to serve as delegate for his shop; and he says, it is asserted, that when Mr. A. P. Super was defeated, as a candidate for the position of delegate, the man who defeated him was discharged, and Mr. Super was then chosen in his place. Mr. Super is now president of the Central Convention. So far as the Central Convention of Shoe Workers' may be said to have a membership at all, membership in it is compulsory. That is, work is refused, at least in a large part of the factories, to all who will not agree to renounce all allegiance to any voluntary organization, and agree to submit to the rules of the Manufacturer's Association, which have been assented to by the Central Convention of Shoe Workers'. This compulsory method is not used, however, in the factory in which Mr. Goodwin works.

Mr. Goodwin asserts that besides the exercise of the influence of the manufacturers in selecting delegates to the Central Convention of Shoe Workers, there is a further exercise of pressure to affect their conduct while they sit as delegates. He declares that a person now employed as foreman in one of the shops, while sitting as a delegate, voted in favor of the workman in a case which came before the body. On returning to the factory he was discharged. He answered various advertisements for positions, but after being asked by manufacturers what his name was, where he had last worked, and other questions, he was told that there was no employment for him. After spending three weeks in looking for a position, he returned to his old employer and asked why he was victimized. He

was told that he could come back to his old position if he would conduct himself in the future to the satisfaction of his employers. He has since worked there (290-294.)

Mr. CROXTON says that the Central Convention of Shoe Workers is composed of delegates elected by the work people of each factory. The number of delegates assigned to each factory depends upon its size. The dues are 1 cent a month. The dues have been collected in various ways; sometimes by shop committees. In one shop, the employees appointed one of the members of the firm treasurer of the shop association and authorized him to levy assessments, 10 cents at a time. Mr. Croxton admits that the manufacturers substantially compelled their employees to be members of the Convention. No one is employed unless he agrees to work under the rules of the joint board of arbitration, and if he accepts employment under the rules he becomes a member of the Central Convention. (323, 327.)

Alluding to the allegation of influence by the manufacturers in the selection of delegates, Mr. Croxton declares that in his own factory the work people "have full and complete control. There never is a member of the firm present that has any influence in the selection of representatives to the Central Convention." (323.)

Mr. SUPER, president of the Central Convention of Shoe Workers, says that in general there is a shop organization in each factory belonging to a member of the Manufacturers' Association. The shop organization has a president, a vice-president, a secretary, a treasurer, and a grievance committee. If there is a disagreement between the firm and the workers in any branch it is referred to the grievance committee. If the grievance committee can not settle it, it is referred in writing by the aggrieved party to the central joint board of arbitration.

By the constitution of the Central Convention each shop is entitled to 1 delegate in it for every 100 employees in the factory over 18 years of age, or fractional part of 100. "There is no per capita tax levied on anyone under 18." The shop organization in each factory meets once a year to elect officers and delegates to the Central Convention. (336.)

Mr. Super says that the convention does not participate in the celebration of Labor Day; the members habitually work on that day. The convention has not taken any action looking to the shortening of the hours of labor. It does not belong to the Central Labor Union of Philadelphia or to the American Federation of Labor, and has not applied for membership. (338.)

Mr. MUNDELL can speak only in praise of the Central Convention of Shoe Workers and the agreement between it and the Manufacturers' Association. It has kept his employees at work 13 or 14 years without any contest. (340.)

2. *Lasters' Protective Union.*—Mr. GOODWIN says that he belongs to the Lasters' Protective Union, a national body. The local branch in Philadelphia has existed since February, 1900. Two previous attempts had been made to start it, but it had been crushed out by the power of the Manufacturers' Association, "its officers being discharged and such a threat kept hanging over their heads that men were afraid to belong." (301, 302.)

Mr. Goodwin declares that conditions in the Philadelphia shoe factories are deplorable, and that the only hope of improvement lies in the formation of a "legitimate trade union," so that the workers can "be represented by business agents or a committee for the purpose of arbitrating difficulties." In order that cheap shops in one city may not depress wages in others it is necessary that the trade union be a national body, which shall make prices uniform everywhere. (302, 303.)

3. *Cutters' Association.*—Mr. CROXTON says that there is a cutters' union among the Philadelphia shoe workers, which he supposes to have been in existence for years. The manufacturers do not object to it because it does not interfere with their business. The manufacturers would not deal with any labor organization except the Central Convention of Shoe Workers. "Any manufacturer who recognizes an outside body is subject to a fine." (324, 325.)

Mr. WILKINS, a shoe finisher, refers to the existence of the Cutters' Association, and says it has never made any trouble. The lasters have made trouble three times, but hardly as an organization before the strike of 1900. On the earlier occasions they acted as individuals. (347.)

4. *Attitude of employers.*—Mr. GOODWIN declares that the second of the rules of the Manufacturers' Association of Philadelphia, which is as follows: "Employers or employees must not discriminate for or against any individual because he or she is or is not a member of any organization," is violated by the manufacturers. He asserts that the president of the Lasters' Protective Union was discharged because of his activity in the organization. He admits that this can not be legally established, but says that a foreman of one of the factories told a committee that the man in question was discharged by the order of the Manufacturers' Association, against the wishes of his own employer. A letter from the discharged man

himself is presented, in which it is said that he was discharged nominally for poor work, but that the foreman who discharged him intimated his regret at doing it, and that the member of the firm to whom he appealed was not able to point out any instance of bad work on his part, and though he at first refused him a letter of recommendation, ultimately gave him one commending his workmanship. (293-295.)

Mr. Goodwin says that the lasters in one of the Philadelphia shoe factories refused to abide by the rules of the Manufacturers' Association and the Central Convention of Shoe Workers, and quit work in a body. The Manufacturers' Association thereupon resolved that until this factory got its required number of lasters no additional male help would be employed by any other member of the association. This action was justified on the part of the association on the ground that "the right to employ or not to employ, to discharge or not to discharge are prerogatives essential to the intelligent direction of any business, especially shoe manufacturing, and provided for in our joint rules. * * * When the members of the Lasters' Protective Association of America publicly declared their antagonism to our joint rules and repelled any arbitration or procedure which would recognize the right of the employer or our joint organization: when they sought to destroy and render invalid all contracts in force, the most stringent measures that will remedy these conditions became necessary." (293, 295.)

Referring to the rule of the Philadelphia Shoe Manufacturers' Association that "employers or employees must not discriminate for or against any individual because he or she is or is not a member of any organization," Mr. CROXTON explains that in joining a labor organization, such as the Lasters' Protective Union, a man pledges himself to strike if he is ordered to strike. On the other hand, one who accepts work under the Philadelphia rules binds himself not to strike. This does, in substance, exclude striking organizations. (327.)

D. Relations of employers and employees.—1. *New England, generally.*—Mr. McDERMOTT says that, generally speaking, the relations between employers and employees in the shoe manufacturing industry in New England are very satisfactory. The workmen are well organized, and the organization seems to be well managed and conciliatory in its methods. (504.)

2. *Philadelphia, generally.*—Mr. WILKINS, a shoe finisher of Philadelphia, says: "There is more freedom in the shoe factories than there is in other trades, I believe. There seems to be more of the family affair. The manufacturer and the employees are closer; they mingle with one another; they give excursions to Atlantic City, and all hands go along, manufacturers as well as employees. The manufacturers even send their employees down." There are people who imagine that they are not getting proper treatment, but Mr. Wilkins has noticed that when such people have gone to the central convention, and have become acquainted with the rules, they have changed their ideas and have become good men there and in the joint board of arbitration. (847.)

Mr. COLLINS, a shoe laster of Philadelphia, cites an experience of his own as illustrating the position of the workers in the Philadelphia shoe factories. He says that the lasters in the factory where he works did not participate in the strike of 1900. Instead, they made out a bill of prices, signed by every man in the department, and presented it to the firm. They hoped that the firm would appreciate this peaceable method of procedure. The firm would not even receive the bill, and under pressure it was withdrawn. "It was known that any man who insisted it should go before the board would be discharged." (806.)

Referring to the statement of Mr. Collins that the lasters and jackers in the factory where he works presented a request for an advance, and the firm refused to give it attention, Mr. CROXTON asserts that, by the customs of the industry in Philadelphia, if the firm paid no attention to a bill of prices presented by the men, it would be under obligation to pay the prices demanded, beginning on the 1st of the following November. If the firm does not wish to pay the bill, it is its duty to bring the matter at once before the joint board of arbitration. "If an advance is asked, and there is no answer made to it before the first joint board of arbitration, * * * the bill stands, and there never has been a time when it has been gone back on." Therefore, if a firm "had had a bill put in to them for an advance on turns, and they made no reply to it, they would have been paid for during the following year at the price that was asked by the men that put in that bill." (336, 336.)

Mr. CROXTON says that on the first Saturday of August in every year all the associated factories are closed and the Central Convention of Shoe Workers has an excursion to Atlantic City. Most of the factories buy tickets for their people, and usually as many of the manufacturers themselves go as are able. (324.)

3. *Strikes.*—Mr. MUNDELL says that the strike of the lasters in his factory in

1900 was begun by the presentation of a demand for an immediate increase of wages. This was refused, though he offered to leave the matter to the joint board of arbitration of the Manufacturers' Association and the Central Convention of Shoe Workers. After several weeks of idleness the men came back at the old rate, but with an agreement for an increase to take effect December 1, the regular time for changes of wages. (341.)

4. *Blacklisting.*—Mr. GOODWIN declares that a blacklist exists among the shoe manufacturers of Philadelphia. Men who participated in the recent strike or lockout in one of the shops recently got employment with another manufacturer, but were afterwards asked whether they had worked in such and such a shop, and were discharged when they admitted that they had. No complaint was made of their work or of their conduct. A foreman in another factory, discharged, it was believed, because of his vote on a disputed case in the Central Convention of Shoe Workers, found it impossible to get employment. An affidavit was also presented in which it was stated that a member of the Manufacturers' Association had admitted the existence of a blacklist, though he stated at the time that only two names were on it. (293, 297.)

Mr. Goodwin says that at the time of the labor trouble of 1887 in the Philadelphia shoe factories the secretary of the Manufacturers' Association got out a book in which each prominent officer and member of the Knights of Labor was referred to and described in a page or two. Mr. Goodwin got two pages. He was not able to get work for 5 years after it, and he believes that the book was what kept him out of work. (300.)

Mr. CROXTON denies that the Boot and Shoe Manufacturers' Association of Philadelphia has ever sent out a blacklist. It is true that "if you know a man whose character is bad, from drunkenness, from disloyalty, being a disturber of the peace, and he is in your employ and is injuring you in any possible way, you will discharge him. If you know of him before he gets into your employ you will not employ him. * * * But the worthy workmen and some of the most violent opponents of us have had work and have worked straight through." (326.)

Mr. Croxton also says that the Boot and Shoe Manufacturers' Association never passed a resolution directing or suggesting the discharge of a man from any shop in Philadelphia. (326.)

5. *Arbitration and agreements.*—Mr. GOODWIN declares that the Lasters' Protective Union is always desirous of arbitrating differences with employers and has asked the manufacturers to arbitrate their recent dispute, but the manufacturers have refused. The manufacturers declared that they would not receive any committee from a trade union and that all overtures must come through the Central Convention of Shoe Workers. This organization the lasters' union refuses to recognize, because it is a means of coercion on behalf of the manufacturers. (295, 296.)

Mr. Goodwin calls attention to several instances in which it is alleged that the rules framed by the Boot and Shoe Manufacturers' Association itself have been violated by its own members. One rule provides that any desired changes of wages shall be presented on or before October 1, shall take effect December 1, and shall continue in force one year. An instance is given in which wages were reduced in February, and the reduction was enforced in spite of the protest of the Central Convention of Shoe Workers. In another instance, the central convention protested against the discharge of lasters who had had a case before the joint board of arbitration. (296.)

Mr. CROXTON says that the first board of arbitration in the Philadelphia shoe industry was formed about January, 1885. The Knights of Labor were then in control of the industry there. The manufacturers were greatly annoyed by the methods of the Knights, and demanded a joint board of arbitration. This was refused until the demand was enforced by a lockout. A joint board was then formed consisting of seven members appointed by District Assembly No. 70, and seven members from the Shoe Manufacturers' Association, and a fifteenth man to act as president. A set of rules was drawn up and adopted by this joint committee. It provided that none but a Knight of Labor should be permitted to work in any factory of the association. Otherwise it was substantially the same as the rules now in force. The joint board existed nearly three years. Mr. Croxton's view is that it was broken up by agitators, who stirred up trouble in order to increase their own importance and their own gain. In the fall of 1887 they succeeded in starting a strike in one of the factories, contrary to the rule, which provided that there should be no strikes or lockouts. The manufacturers tried to induce the Knights of Labor to control the strikers and have them go back to work according to the agreement. Instead of doing so they caused strikes in all the shops. Mr. Croxton declares that Mr. Goodwin, though he pretended at the time that the strike had been forced by the men contrary to his wishes, was

CXXIV INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

really the author of the strike, and carried it against the desires of the most of the shoe workers.

After this the manufacturers declined to treat longer with the Knights of Labor, because the Knights had failed to live up to their contract. They said to the work people that they believed in arbitration and would insist on arbitration, but would have an organization made up of shoe workers alone, without bricklayers and carpenters and other trades. So the shoe workers formed the Central Convention of Shoe Workers and appointed members of a joint board of arbitration. As has been said, the rules adopted are substantially the same as those accepted by the Knights of Labor, except that the restriction upon the employment of nonunion men is removed. All questions that have since arisen have been arbitrated, and labor troubles have been eliminated from the Philadelphia shoe industry. (321-323, 328.)

Mr. Croxton declares that if the manufacturers were free they could in times of depression meet competition and get wages lower than they have got them. "He would get more out of it to fight and take advantage of people than he can under our system." But the manufacturers feel that they are doing the fair thing. (332.)

Referring to the statement that the Philadelphia Lasters' Union had asked the manufacturers to arbitrate and had been refused, Mr. Croxton says that the shoe manufacturers can not arbitrate with the workers in any single branch because of the methods of organization of the factories. The work is done by what is called a string team, so organized that each piece of work passes successively from one hand to another. At the same time, Mr. Croxton admits that the manufacturers deal with each branch as a branch in fixing the bill of wages. They even insist on doing so. In spite of this he says: "We can not deal with them so far as strikes and arbitration is concerned as a branch separately." (325.)

Referring to the instance mentioned by Mr. Goodwin, where certain wages had been reduced at a time other than that fixed by the joint rules, Mr. Croxton says that the rules of the joint board of arbitration permit changes "between seasons" when the change is signed by the manufacturer and by every employee in the branch affected, and goes before the joint board of arbitration and is approved. Changes have been made in that way during the last 13 years, both up and down. For instance, when the textile works, at certain seasons of the year, have drawn away the work people, it has been necessary to raise wages temporarily. On the other hand, at a dull time, Mr. Croxton had an opportunity to get certain work, case work for a jobber, if he could make it at a certain price. He was able to do the work if the workmen accepted a reduction of wages. He made the proposition, and it was accepted. (329.)

The following statement of the results of arbitration in cases considered by the joint board of arbitration was presented by Mr. TOWNSEND: (348.)

Chronological record of the Joint Board of Arbitration of the Shoe Manufacturers' Association and Central Convention of Shoe Workers from January 4, 1888, to September 4, 1900, inclusive.

Cases presented to the board for adjustment	69
Settled favoring the employee	38
Settled favoring the employer	3
Rejected under the rules	6
Withdrawn and settled by employer and employee	22

Mr. COLLINS declares that the workers in the Philadelphia shoe industry have no faith in the joint board of arbitration and no hope of justice from it. He knows this from his own observation and from conversation with his shop mates. The men who are supposed to represent the workers on the board are the creatures of the employers. They are mostly men without character, and, as a rule, are not good workmen. They receive favors in the factories for the services they render on the board. (306.)

Mr. MORRELL, a foreman, in Zeigler Brothers' factory, states that he never knew any workman to be victimized for serving on a shop committee to present grievances to the manufacturers. (340.)

Mr. WILKINS says that he has taken a prominent part in the Central Convention ever since it was organized. He was president of it for 4 years, and was a member of the joint board for 10 years. He does not remember any case which he does not think to have been settled fairly and squarely. He never knew of any cases of victimization brought before the joint board. The employees are far better off under the present system than under the old. Under the Knights of Labor he has been on strike 3 times in 1 week. (346, 347.)

Mr. SUPRZ says that he was president of the Central Convention of Shoe Workers for 3 years in its early days and is president at present. He has been a member of the joint board of arbitration continuously since the Central Convention

was established, except 1 year. Mr. Super asserts that the cases that have come before the board have been honestly and fairly adjusted. He denies that the manufacturers express their wishes as to the decisions that shall be rendered. "I know that I was never dictated to, and I have seen it stated in the papers that I was." He declares that he has never known a case in which a workman was discharged for presenting a grievance to an employer. There have been plenty of rumors of such things, but the witness has gone directly to the people that others said were victimized, and they have said they were not. Mr. Super declares positively that the present organization has been far more beneficial to the working people than the "one-sided labor organizations" which have preceded it. (333, 334, 337, 339.)

E. General conditions of labor.—1. *Employment.*—Mr. CROXTON testified that his own factory runs 52 weeks in the year. He was on the point of making the first week's shut down that he had made in 5 years. He works entirely for large department stores. They give large orders far in advance, and he is able to distribute the work evenly throughout the year. Other factories, which make case-lot goods for jobbers at such close prices that they must run full or lose money, may shut down a month each year. (329-331.)

2. *Machinery.*—Mr. McDERMOTT says that since the introduction of machinery fewer persons are employed proportionately to the number of shoes made, but the number of employees is probably as large, because of the greater production which has been due to the increased use of machinery. There has been displacement at particular points, but on the whole there has been a larger demand for labor, due to the cheapening of the product. Hours of labor have been shortened through the introduction of machinery. Under the old hand-work system there was no time limit. A man simply worked as long as he could. (502, 505.)

Mr. GOODWIN says that machinery introduced into the lasting department during the last 10 years, has probably displaced 20 per cent of the lasters. The machinery must be run by an expert laster, and another must prepare the work; but two men with the machine do the work that formerly required three. The machinery is used on all kinds of shoes except those made with the Goodyear machine. It is generally applied in the trade. (298, 302.)

3. *Wages.*—Mr. McDERMOTT says that in 1860 the average yearly wages paid in the boot and shoe industry were \$251.47; in 1870, \$250.23; in 1880, \$387.31; in 1890, \$476.87. The wages paid in Europe are less than half the wages paid in this country. (504.)

Mr. CROXTON says that it is impossible to make general comparisons of wages in the shoe industry at different times. The most of the lasting is done much cheaper than it was done 10 years ago. That is because machines, which cost \$500 apiece, have been introduced. But Mr. Croxton believes that workmen make about the same as formerly. When the strike of the lasters came on, Mr. Croxton corresponded "with the best shoe factories making the same kind of goods in New England, New York, and Ohio, and got their bills of wages, to see if there was any reason for the complaint." He found that no factory paid higher wages than his and many paid lower.

Mr. Croxton does not think that the wages of lasters in his factory vary more than a dollar or two from week to week. In some other factories the variation would be greater. (328, 329, 331.)

Mr. SCHOBBER, whose factory was spoken of by Mr. Croxton as paying far higher wages than any other shoe factory about Philadelphia, says that the average wages of his men (including boys at \$3 a week), as shown in his last report to the State, were a little over \$15 a week. The average wages of the girls were \$6.40; but that includes about 30 girls engaged in cleaning and the like at from \$3 to \$4 a week. (346.)

Mr. MUNDELL, who does work for the Government and also makes children's shoes in large quantities for jobbers, says that his piece prices are necessarily smaller than those of manufacturers who cut 6 or 12 or 24 pairs at a time. In doing large quantities of work exactly alike, however, the men attain great quickness. From this cause, though piece prices on Government work, for instance, are low, the actual earnings of the lasters are about the same as on other work. The week before Mr. Mundell testified he employed 67 lasters; their total wages were \$615.70, and their average wages \$9.19. The highest payment was \$20.30 and the lowest was \$4.10. This low wage was made by an old man who is no longer able to accomplish much, but is allowed to come and do what he can. The average wage of all the lasters together, taking a considerable number of weeks, has been \$10.04. The highest amount made by one man in one week was \$22.95. (340, 342.)

Mr. Mundell states that some years ago he was paying his cutters by the week, from \$12 to \$15, according to their quickness. The work was costing him nearly 5 cents per piece. He wanted to put the cutters on a piece price, and offered them 3½ cents. They demanded 4. He told them that if they would work a few weeks at 3½ he

would then take the matter before the joint board of arbitration. During the trial weeks some of the men made \$22 and \$23, and the average was about \$17. The board decided against the men, "as the wages were sufficient, or the piece price was about as high as I could afford to pay." (341.)

Mr. GOODWIN says that in lasting all the work is done by piecework and that piecework is the general practice in the shoe trade. However, the rules of the Shoe Manufacturers' Association allow a manufacturer to change his system from piecework to day work, or vice versa, as he pleases. This rule is capable of being used to effect reductions of wages. Mr. Goodwin believes that the piece prices are about the same in Philadelphia as in New England, but the hands are kept better employed in New England, so that the actual earnings are greater. (297, 301, 302.)

Mr. Goodwin says that for a shoe for which 10 cents was paid to the laster before the introduction of "the present so-called system of arbitration" the laster now gets 5 cents or in some cases less. Machinery for lasting has, however, been introduced during the last 10 years which enables 2 men to do the work of 3. Wages have gone steadily downward, but on December 1, 1900, just before Mr. Goodwin's testimony, the lasters got an advance of about 20 per cent. Mr. Goodwin believes that this was a result of the lasters' strike. The advance did not affect any other branch of the industry. (297, 298.)

Mr. Goodwin says that the average wages of lasters, adult males, in Philadelphia, are less than \$5 a week for the 52 weeks of the year. They work about 50 weeks. Mr. Goodwin himself has formerly earned as much as \$22 a week, and during 1900 he has drawn about \$18.75 for 1 week's wage, working 60 hours, but in some factories the lasters come out with \$2.75 or \$3. One great reason of these low wages is that the work is not constant. A man has to be in the factory all the time, but he may have to wait 2 or 3 hours a day. Mr. Goodwin admits that his statement of average wages is not based on any computation of his own; it is a statement that has been made to him by others. (302.)

Mr. TOWNSEND, secretary of the executive board of the Shoe Manufacturers' Association of Philadelphia, says that he inquired of one manufacturer who makes a cheap line of goods and employs lasters perhaps as steadily as any factory in the city, and is assured that his slow lasters earn from \$7 to \$10 a week and the quicker ones from \$12 to \$18. (348.)

Mr. SUPER, who is a McKay operator, says that he has made \$15 and \$18 a week, and even as much as \$22 and \$23. The prices for misses' and children's shoes vary with the grade. For women's shoes the operators in the factory where he works get three-fourths of a cent a pair. He can do on the average about 450 pairs a day; he generally does from 2,300 to 2,500 pairs a week. He considers himself an average operator. He has worked beside a man who could do 800 pairs a day. As to the wages of lasters, he knows that some make very good wages and some make very small wages. Lasters have told him that they made \$15 and \$16 a week. It is hard to make comparisons of piecework prices between different shops because the systems of work are different. (334, 335.)

Mr. Super offers a partial explanation of the statement that men work at lasting for less than \$5 a week in Philadelphia by saying that men in whose own proper department work is slack are sometimes employed in other departments, where their earnings are small, partly from lack of skill. Thus, a man who had been receiving from \$17 to \$32 as a second laster (paying the jacker out of these amounts) was put on McKay work, and his earnings in three successive weeks were \$4.93, \$4.81, and \$4.79. (335.)

Mr. COLLINS says that there has been no actual reduction in piece prices paid to lasters in the factory where he works. The prices are perhaps a little higher than they were 8 years ago. But the quality of the work has been raised so much that a man can not earn more than half as much as he earned 8 years ago. There are some jobs in the factory where men make very high wages, but they are extremely few. Some operators on the Goodyear machine make about \$35 a week, while men working by the same bench and doing harder work and working longer hours get only \$6 or \$7 a week. In this factory the operators still have the old piece prices of 8 cents and 8½ cents a pair. In most factories they work by the week and get from \$15 to \$30. (307, 308.)

Mr. MORRELL says that the second laster has to pay to the jacker about one-third of the amount which he receives—say, \$11 or \$11.50 out of \$32. (339.)

4. *Hours of labor.*—Mr. SUPER says that the week's work in his factory is 58 hours—10½ hours a day for 5 days and 5½ hours on Saturday. (334, 335.)

5. *Sweating system.*—Mr. GOODWIN says that the sweating system does not exist in the shoe trade, but that substantially all shoes are made in factories. (299.)

6. *American and European workmen compared.*—Mr. McDERMOTT says that the employees in the boot and shoe manufactories of this country do not as individuals

turn out more per man than do the employees in English factories. Men from English factories come here to work and become practically American workmen. American manufacturers have a better system and a better management. The labor unions in Great Britain are very strong and very arbitrary, and if a man begins to push ahead with the idea of earning more he is cautioned and warned and expelled if necessary. Through the system employed in this country and through the use of machinery American manufacturers get a much larger product and utilize labor to a much better advantage than is the case in England. The English manufacturers can use the same machinery if they choose. The advantage to American manufacturers is that the English do not use it. If they followed the same system they would get the same results. (504.)

XXIII. SHOE MACHINERY TRADE.

A. Conditions of capital and business.—1. *United Shoe Machinery Company.*—(a) *Business and control of trade.*—Mr. ELMER P. HOWE, member of the executive committee of the United Shoe Machinery Company, says that that company is engaged in manufacturing and renting shoe machinery to the manufacturers of boots and shoes. Most of the machines which it manufactures are used for attaching the soles of shoes to the uppers. It manufactures some finishing machinery also, but does not manufacture any machinery that is used on the uppers of shoes. The company has not consolidated the manufacture of machines. At the present time it is obliged to purchase all its castings. It expects later to have its own foundry, and through the consolidation of the different manufactures to dispense with the duplication of large and expensive tools. (482, 485, 486.)

Mr. Howe says that while the United Shoe Machinery Company is altogether the largest manufacturer of shoe machinery, and supplies a very large proportion of the shoe machinery used, there are other companies manufacturing similar machinery. The company has a monopoly only to the extent to which it has secured control through its diligence in securing patents and its enterprise in furnishing manufacturers with the best machinery. It would, however, take a new company quite a number of years to reach the efficiency and to afford all the facilities that the United Company affords; but, except so far as patents give the company a control in certain lines, there is no reason why a combination of brains and capital could not obtain the same results.

The company confines its own business to the United States and to Australia, but it controls corporations in other countries and through them controls practically the whole of the manufacturing territory in Europe. (485, 486, 491.)

Mr. McDERMOTT, editor of the *Boot and Shoe Record*, says that the United Shoe Machinery Company has control of practically all machines that it is necessary to use in a factory. The patent on the McKay machine has expired, and the company controls it simply as a matter of business. Some of its other machines it controls through patents. There are other machines in the market which can be utilized in place of the machines of the United Shoe Machinery Company. That company, however, has a complete line of shoe machinery, and it offers to equip the factory from end to end and take care of it all the way through. The Standard Shoe Machinery Company manufactures machines which do practically the same work. (508.)

(b) *Organization and capitalization.*—Mr. HOWE states that the United Shoe Machinery Company was formed without the aid of any so called promoter or banker or outside influence. The directors of the Goodyear Shoe Machinery Company, one of the companies entering into the consolidation, sent a circular letter to the stockholders of the company advising them that the United Shoe Machinery Company had been formed with an authorized capital of \$25,000,000, divided into \$12,500,000 preferred and \$12,500,000 common stock (par value \$25), of which it was proposed to issue \$8,625,000 of preferred stock and \$8,625,000 of common stock for the purchase of all the stock of the companies entering into the combination. The stockholders were also informed that a syndicate had been formed which would take sufficient common and preferred stock in equal amounts at par to pay the floating debts of the several constituent companies and to provide the company with at least a half million dollars in cash as a working capital. Similar circulars were also sent out by the directors of the important constituent companies. In forming the consolidation the stock of each company was taken at a lower price than its stock was selling for in the market. In the case of the Goodyear Company, each holder of 100 shares of the Goodyear stock received 80 shares of preferred and 80 shares of common stock of the United Shoe Machinery Company; Goodyear stock being valued at \$40 per share. Arrangements were made with the American Loan and Trust Company, of Boston, to issue the stock of the United Shoe Machinery Company in exchange for the stocks of the constituent companies

on the terms contained in the circulars. Substantially all of the stock of the constituent companies was exchanged on the basis provided for. The only profit which the syndicate of directors made out of the transaction was the increase in the value of the stock which they subscribed and paid for at par.

Until last year, each corporation which entered into the combination retained its own business, the United Shoe Machinery Company owning substantially all the stock of the several companies. During the last year, all the assignable property has been conveyed to the United Shoe Machinery Company, and it is only a question of time when all the property of every form of the constituent corporations will be absolutely vested in the United Shoe Machinery Company. (484, 485.)

(c) *Reasons for consolidation.*—Mr. HOWE says that the three important companies which united to form the United Shoe Machinery Company were not competitors so far as the bulk of their business was concerned, but from the way in which business was done there was a duplication of expenses. The companies rented their machines, and were obliged to see that the machines were kept in good running condition. Because of this, they established agencies in all the shoe manufacturing centers, at which they had to have a superintendent, one or two clerks, and a number of trained men who were familiar with the construction and operation of the special machines. One set of men in each of the places could look after the machines as well as three sets of men, and that was the principal thing that led the officers of the separate companies to form a combination. Another reason was the tendency which existed on the part of the companies to buy up patents which might perhaps be availed of by other companies. (488.)

(d) *Effect of combination on employment.*—Mr. HOWE says that there are more workmen employed by the United Shoe Machinery Company in its factories than were ever employed by the constituent companies, and that the number of men employed at the agencies established throughout the country for the purpose of superintending the erection and operation of machines, has not been reduced, as might have been expected. The principal reason for this is that the business has greatly increased since the consolidation, as a result of prosperity in general business. Another reason is that better service has been rendered to the manufacturers, and this has resulted in a more extended use of machinery. (485.)

(e) *Effect of combination on wages.*—Mr. HOWE says that there has been no substantial change in wages since the organization of the United Shoe Machinery Company. There may have been increases in individual instances, but there has been no general increase. (487.)

(f) *Effect of combination on prices.*—Mr. HOWE says that the rental charge for most of the machines is the same under the United Shoe Machinery Company as it was before the formation of that company. In the case of turned work, there has been a reduction of about 50 per cent in the rental. In the case of metallic machinery, there has been, during the past year and a half, what is equivalent to a reduction, because, although there has been a rise in the cost of iron and copper during that time, the prices charged for materials have not been increased. Had the old company continued business, it would have been compelled to increase the prices, but because of the large business done by the United Company, it has been able to hold the prices at the same figure. (490.)

(g) *Effect of combination on inventions.*—Mr. HOWE says that there has been no cutting off of inventions through the formation of the United Shoe Machinery Company, and that there has been no diminution of invention in any direction. The policy of the company is to foster new inventions and to improve machinery as much as possible in order to maintain its hold on the business and to be able to supply manufacturers with the best machines. An inventor would not necessarily be compelled to sell his invention to the United Shoe Machinery Company. The company encourages inventions among its employees by allowing the inventor the full privilege of disposing of his invention as he pleases, or by paying him something for it in case the company adopts it. That does not apply to inventors whom the company hires on contract. It hires certain men for the purpose of inventing. (485, 488, 489.)

(h) *Relations with Flagg Manufacturing Company.*—Mr. HOWE says that the United Shoe Machinery Company is selling all goods of the Flagg Manufacturing Company which are sold outside of the United States. The United Company, through its affiliated companies in Europe, can handle these goods at very much less expense than any single company could handle them through the establishment of agencies in foreign countries. (487.)

2. *Leasing of machinery.*—Mr. M'DERMOTT says that the machines used in the manufacture of boots and shoes are operated under lease, and a royalty is paid according to the number of pairs of shoes sewed. There is a counter on the machine to indicate the extent to which it is used. There has been some friction between the shoe manufacturers and the United Shoe Machinery Company because

of the attempt made by the United Shoe Machinery Company to prevent manufacturers from using competing machines. There have been negotiations between the shoe manufacturers and the managers of the United Shoe Machinery Company, and an adjustment of differences has been made. Mr. M'Dermott submits a copy of the report of the committee of the New England Shoe and Leather Association, which carried on negotiations with the United Shoe Machinery Company and secured a modification of the leases under which the company's machines are operated by the shoe manufacturers. (508, 510-512.)

Mr. HOWE says that the machinery manufactured by the United Shoe Machinery Company is almost exclusively put out on rental and royalty under agreement with the manufacturers. The position taken by the company has been that if a manufacturer would agree to use all of the machinery of the United Company in his factory which he could use to advantage the company could afford to give him a better rate than it gives the manufacturer who uses only a part of the machinery manufactured by the company. Negotiations for the modification of the terms of the lease have been held with a committee of the New England Association of Boot and Shoe Manufacturers, and provision has been made, as the result of those negotiations, for manufacturers who want machines of the United Company in only one department. In the case of the metallic department, this privilege has been granted upon condition that the manufacturers pay 10 per cent more for the fastening materials they use than is paid by those who use all the machinery of the United Company. The leases of the United Company are substantially the same as were those of the constituent companies. The royalties are paid monthly, and a discount of 50 per cent is given if payment is made before the 15th of the month. Indicators are attached to the machines so that it can be determined to what extent the machine has been used. The small manufacturer gets practically the same terms as does the large manufacturer. Mr. Howe submits copies of the leases used by the United Shoe Machinery Company. (487, 488, 490, 491, 493-497.)

3. *Use of lasting machines.*—Mr. M'DERMOTT says that in general the use of lasting machines has proved successful. It is claimed that the machine is applicable to all grades of shoes. Some factories, however, will not use the machine, preferring hand work, especially on the better qualities. (508.)

Mr. HOWE says that there are lasting machines that are adapted to all classes of work. The machines are more successful, if anything, in the higher classes of goods than in the lower classes. In the highest class of shoes machine lasting is better than hand lasting. (491.)

4. *Foreign trade.*—Mr. HOWE says that the foreign trade in shoe machinery is increasing very rapidly, especially in Germany. The United Shoe Machine Company has a small factory in Frankfort with American superintendents and two or three American foremen. Some of the castings up to the present time have been sent from this country. There is an advantage in manufacturing the machines there, because of the duty of 25 or 30 per cent which is imposed by Germany. Most of the machines used abroad, however, are manufactured in this country, except so far as is necessary to comply with the patent laws of foreign countries. (485, 486.)

5. *Tariff on steel.*—Mr. HOWE thinks that the reduction of the tariff on steel products would have no effect whatever on the shoe-machinery industry. The value of the raw material which enters into shoe machinery is so slight in comparison with the value of the labor that is put into it that a diminution of 50 per cent in the cost of raw material would represent very little difference in the cost of the machines. So far as the tariff on shoe machinery is concerned, there is no shoe machinery imported into this country, and the patents and the skill in manufacture possessed by the manufacturers in this country would enable them to control their own market if the tariff were removed. (489.)

B. Conditions of labor.—*American and European workmen compared.*—Mr. HOWE says that the labor employed in the manufacture of shoe machinery is very much cheaper in Germany than it is in this country, but that it is by no means as efficient. Counting the productiveness of the labor, it is Mr. Howe's opinion that American labor is cheaper even at the higher price. (490.)

XXIV. LOCOMOTIVE, FORGINGS, AND TRANSMISSION MACHINERY TRADES.

A. Development of locomotive manufacture.—Mr. CONVERSE, a member of the firm of Burnham, Williams & Co., owners of the Baldwin Locomotive Works, says that at the beginning of railroad operations in the United States, the locomotive had a single pair of driving wheels, and weighed probably not over 13 or 16 tons. The first change was to add a second pair of driving wheels and couple them together. Then 6 and 8 driving wheels were

coupled, and the weight rose to 20 or 25 tons. This occurred about 1840 or 1850. In the next two decades, from 1850 to 1870, the standard American locomotives were about 40 tons in weight for freight service, and about 35 tons for passenger. Now freight locomotives of 100 tons, and passenger locomotives of from 70 to 80 tons are the rule. Forty years ago a 2,000-gallon tender was considered a very liberal size. The Baldwin Locomotive Works are now about to build tenders of 7,500 gallons capacity. A locomotive can run probably 40 or 50 miles without taking a supply of water in the freight service, and perhaps 75 to 100 miles in the passenger service.

The quality of the material in locomotives has also been greatly improved. Steel has largely been substituted for iron. This is made possible by the great improvements in the production of steel. The boilers are now made capable of bearing a steam pressure of 200 pounds to the square inch. Thirty or 40 years ago 100 pounds was the ordinary pressure. Forty years ago a large part of the mileage of American railroads was laid with iron rails weighing less than 60 pounds to the yard. To-day, on the roads of heaviest traffic, steel rails of 100 pounds to the yard are used. Thirty or 40 years ago a car weighing 10 tons was loaded with 10 tons of freight, and a heavier load was discouraged. Now cars are built to carry 100,000 pounds or 50 net tons. (231, 232.)

B. Conditions of capital and business.—1. *Baldwin Locomotive Works.*—Mr. CONVERSE says that Mr. Baldwin, the founder of the Baldwin Locomotive Works, was a manufacturing jeweler of remarkable mechanical ability. When railroads were first built in this country and locomotives were imported from England, Mr. Baldwin was one of the most competent men to handle them. His first connection with locomotives was an engagement to put together one which had been imported from England for the New Castle and Frenchtown Railroad. He built his first locomotive in 1831-32, for the Germantown Railroad of Philadelphia. The business has steadily grown until the Baldwin Locomotive Works are the largest in the world. They turned out 1,200 locomotives in 1900, of a value of between \$16,000,000 and \$17,000,000. They employ about 9,000 hands, and use a capital of not less than \$10,000,000.

There are about 10 large locomotive works in the United States. Very few railroads attempt to manufacture their own locomotives. No such attempt has ever been generally made. It is impossible for any railroad to build its own locomotives as cheaply as can works devoted exclusively to that industry. (230, 231.)

2. *Gun forgings and armor plates.*—Mr. HARRAH, president of the Midvale Steel Company, says that there are only two concerns in the country making gun forgings, his own company and the Bethlehem Steel Company. There are only two concerns making armor plate, the Bethlehem and the Carnegie. Mr. Harrah's company recently bid on a lot of armor plate at a price which would barely have seen it out. The contract was finally given to the other concerns at a price \$17 a ton higher, because the Midvale company could not begin to deliver as quickly as could the Bethlehem and the Carnegie companies, which had their plants established. Though Mr. Harrah was sorry to lose the contract, he thinks the Government acted wisely.

Mr. Harrah estimates the profits on armor plate at 23 per cent. This seems very great, but, when the risk of rejection is considered, it is very small. It does not begin to compare with the profit on steel rails, beams, and building material. The point is that when tests are made of armor plate for Government work, there is no test of each separate piece, but a whole batch is accepted or rejected according to the results of two shots. If it is rejected, it is a total loss. The United States Government is exceedingly severe on the makers of such material. The English Government buys similar materials from English makers at 31 cents a pound. The French Government, when it buys the gun forgings from French makers, pays 34 cents a pound. "When our Government buys its materials from us it pays us 22 cents a pound and always tries to jew us down * * * and the specifications under which material is made for the American Government to-day are more severe than the specifications under which any foreign material is furnished to any foreign government." Heavy penalties are also collected. (354.)

Mr. CHARLES H. CRAMP, president of the William Cramp & Sons Ship and Engine Building Company, says that the profit on armor making is something enormous. The people who make money on their ships are not the persons who design them or construct them, but the ones who make the guns. The armor makers do not get too much profit, because it involves an immense outlay of money to build an armor plant, and the business is not continuous. Still a ship could be put in at cost if the company building it got the profit on the armor. (420.)

3. *Drop forgings.*—Mr. WILLIAM C. REDFIELD, treasurer of J. H. Williams & Co., manufacturers of drop forgings, says that there are from 80 to 90 concerns manufacturing products which come into competition with those manufactured by J. H.

Williams & Co. These concerns are scattered all over the country. Not all of them make all the kinds of products which J. H. Williams & Co. make, but each of them has one or two specialties which come into competition. The business of J. H. Williams & Co. is about equally divided between goods which are known as stock articles—that is, goods which are carried in stock and catalogued—and goods which are made through special order. All of the stock articles come into competition with products manufactured by every other drop-forging concern, and about two-thirds of the specialties come into competition with products of other concerns. The remaining one-third of the specialties manufactured come into competition with goods which other manufacturers produce by different processes, but which they claim will accomplish the same results. Practically, therefore, there is competition throughout the entire business. J. H. Williams & Co. make forgings which are used in electric motors, guns, pistols, rifles, sewing machines, typewriters, and in all kinds of light, quick-running machinery. (687.)

4. *Prices of steel products.*—Mr. REDFIELD says that the prices of steel products rose very sharply at the beginning of 1900 and fell off very sharply in the latter part of the year. They fell off much more than one-half, and they have advanced somewhat since then. They are now ranging at figures which fall below the maximum of last year, but are approximately 50 per cent higher than the minimum of last year. The fluctuation was due chiefly to the operation of the law of supply and demand. The formation of the large steel combination has tended to steady prices. It is of the greatest importance to the country at large that prices should be steady. One of the difficulties found in efforts to extend our export trade is the fluctuation of prices. (688.)

5. *Export trade.*—(a) *Locomotives.*—Mr. CONVERSE says that the export trade in locomotives has been growing for the last 40 years. At first it was confined chiefly to Cuba and South America. Within the last 25 years it has extended to the Eastern Hemisphere. In the last 10 years the growth has been very great. American locomotives have now been sent to almost every country where railroads are in operation. Within the last 3 years the Baldwin works have built locomotives for railways in England, France, and southern Germany, though these countries are large locomotive producers and have been competitors for the trade of South America. The Baldwin works have sold many locomotives to the Russian Government—about 150 during the past 4 or 5 years for the Trans-Siberian Railway. It is the policy of the Russian Government to develop industries in Russia, and a protective duty of about 4 cents a pound is levied on locomotives for that purpose. The Government does not order locomotives abroad if the Russian works can meet the demand. The capacity of the Russian works is not large enough, however, to supply the necessary equipment for the Trans-Siberian Railway in addition to the ordinary requirements of the country. It was for that reason that orders were placed abroad. Since the Government was the purchaser, the Russian tariff did not, of course, enter into the question. Indeed, since the railroad system in almost every country except the United States is largely a government system, foreign tariffs cut no great figure in the locomotive business.

In general, the things which give the American locomotive builders an advantage over the European builders are three: First, large capacity and excellent facilities make it possible to fill a large order in a very short time; second, American locomotives are to some extent preferred by reason of their type and size and details; third, the American locomotives are built at a less cost per unit of weight than the ordinary European locomotives. The principal competitors in the markets of the world are England and Germany, and to a less extent France and Belgium.

The foreign orders of the Baldwin Locomotive Works are not procured by traveling men employed by the concern, but through foreign agents—business men in their respective countries. The firm has a general agency in London and agencies in Norway, Sweden, Russia, China, Japan, and southern Germany. Its export business is from a quarter to a third of its whole output. It does not sell abroad on credit, nor receive nor negotiate securities of foreign corporations. The larger part of the price of a locomotive is generally paid on the completion of the contract, and a small percentage is retained for perhaps a year, as a guaranty against defects. (231-236.)

Mr. Converse says that the locomotives which are sent abroad by the Baldwin Locomotive Works are substantially the same in type as those used in America, but are much lighter and less powerful than the average American locomotive. American and European locomotives have been growing more and more alike in type. The two principal points of difference remaining are the use of the bar frame in America and of the plate frame in Europe, and the invariable use of outside cylinders in America, while inside cylinders and crank axles are very largely used in Europe.

CCXXII INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

The basis of price is substantially the same for the locomotives which are exported as for those which are sold in this country. The foreign locomotive costs a great deal more because it has to be built and then entirely dismantled and boxed. Freight, insurance, loading, and unloading charges have to be paid, and mechanics sometimes have to be sent thousands of miles to take charge of erection and to try the engines. (231, 235.)

(b) *Transmission machinery.*—Mr. CRESSON, a manufacturer of transmission machinery, says that he sells his goods all over the world. He sells to commission houses, and also has traveling men of his own. It was at the time of the depression in 1893 that he began to export in a large way. Before that time it would have been possible to find an export market because of the superior quality of his goods, but the domestic trade kept him occupied and he did not care to do it. When the domestic trade fell off, he enlarged his factory and put in new machinery to handle very large work, and went heavily into the export trade. (286-288.)

(c) *War materials.*—Mr. HARRAH says that the Midvale Steel Company had an inquiry from the English Government for a large amount of war material in February, 1900, and submitted prices and times of delivery. The prices were satisfactory, but it was only after consultation with the United States War Department that the English Government was convinced that deliveries could be made at the time promised. In the end the English makers raised such strong objections to the buying of war material in America that the British Government dropped the matter. (354.)

(d) *Drop forgings.*—Mr. REDFIELD says that J. H. Williams & Co. are selling their products all over the world in competition with the products of Birmingham manufacturers. About one-eighth of the products manufactured by the company are sold abroad. Both stock products and specialties are exported. Nearly all of the specialties manufactured by the company are sent abroad, where they come into competition with similar goods from this country and with goods made in Germany. The company is making two lines of goods which are sold exclusively abroad. These goods are tools for machines which are not used in this country. A few of their goods are sold at lower prices in the foreign market than in the domestic market, but many of the goods sold are sold at higher prices abroad than at home. The company simply meets the market and gets the largest price it can. (661, 667, 668.)

6. *Patents.—Locomotives.*—Mr. CONVERSE says that his firm owns one important patent, for a plan for a compound locomotive, which is largely used both in America and all over the world. Aside from this there are no patents covering any important features of locomotives. His firm owns patents on some special machine tools. (233.)

7. *Combination.—Locomotive manufacture.*—Mr. CONVERSE says that efforts have been made to combine the locomotive works of the United States, but thus far without success, because some of the works, including his own, are not favorable to combination. He does not believe that locomotives could be produced more cheaply if all the works were under one management. (234.)

8. *Tariff on locomotives.*—Mr. CONVERSE does not think that foreign locomotives would be imported into this country if there were no duty on them at all. He knows of only one locomotive which has been imported in 25 years. That was brought in by the Pennsylvania Railroad as a sample of a new type and of English workmanship. The Baldwin Locomotive Works do not import any material except that in the case of locomotives bought for foreign railways a preference is sometimes expressed for certain appliances or parts of foreign manufacture. These parts then have to be imported. They are exported again, subject to the drawback provided for in the tariff law. (233-236.)

9. *Condition of business.—Locomotive manufacture.*—Mr. CONVERSE attributes the improvement in the condition of his own business as compared with the years following 1893 to "the general prosperity of the country and the large demand for our crops abroad, the immense development of railroad transportation, and the sound financial condition in which the country has been placed within the past few years, and, to some extent, to the favorable legislation. I mean by that the feature of being able to import foreign-made articles for locomotive manufacture and to secure a drawback on them when they are sent out of the country again." This one item of tariff drawback might mean a difference of 4 or 5 per cent in the price of a locomotive. (234.)

C. *Labor organizations.—Attitude of employers.*—Mr. CRESSON says that he is not opposed to organized labor and has given little attention to the question whether his men are organized or not. "Quite a number of times there have been people around to stir them up, but they have not done much. We have not opposed them except when they interfered with the business." The leader of

the machinists has repeatedly desired to go through the shops and talk to the men. It has not been thought best to permit it. "He is one of those people whose business it is to stir up the workingmen and get them discontented with what they are doing." At the same time the men are American citizens and are fully entitled to have something to say about wages and conditions. (267, 268, 269, 272.)

D. Relations of employers and employees.—Mr. REDFIELD says that no difficulties arise between J. H. Williams & Co. and their employees. There has never been but one difference, and that was due to mistakes made by a subforeman. As a result of the mistakes of this subforeman there was a strike in one department of the company's works which lasted for a week. The result of the strike was that the subforeman was discharged and all the men were reemployed. Some of the men who were employed by the company when it started are still with it. (660, 663, 664.)

Mr. CRESSON says that he has never had a strike in his 40 years of business. A very large proportion of his men have been trained up from boyhood in his shop. There are, however, a considerable number of foreigners of various nationalities. (267.)

E. General conditions of labor.—1. *Wages*—(a) *Steel works*.—Mr. HARRAH says that possibly 20 per cent of the workmen employed by the Midvale Steel Company are paid by the day and all the rest by the piece. The men prefer piecework to day labor or a sliding scale. When a rate is fixed it is understood that it will prevail for a given time—a year, 18 months, or 2 years. Both the men and the company have always lived up to this understanding. The company gives the men every facility and advantage in the way of appliances, and pays not only a good wage but a large bonus for overproduction. Many of the men turn in \$40 a week one week after another. Probably 1,000 or 1,200 men, one-third of the workmen, can do that. The result is that the most of them, being satisfied with their condition, work only 5 or 5½ days in the week. The average attendance is 52 hours a week. (349, 350.)

(b) *Machinery trade*.—Mr. CRESSON says that his men average about \$14 or \$15 a week and his boys from \$5 to \$8. He never reduces the pay of an individual; did not do so during the depression of 1893. The average wages have risen perhaps 20 per cent since the hard times, but are not materially higher than under the Harrison Administration. The average wage has been raised by increasing the wages of new men taken on.

Mr. Cresson thinks that wages in Philadelphia are lower than in other centers, such as New York, Baltimore, and Chicago. A machinist, for instance, receives about \$15 in Mr. Cresson's shop, while he might receive \$16 or \$18 in one of the other cities. This is accounted for largely by the cheaper living in Philadelphia. Another factor is steadiness of work; Mr. Cresson's men never have to lose any time; but he does not think their yearly wages are as high as they would be in other places. (266-271.)

(c) *Locomotive manufacture*.—Mr. CONVERSE says that though his firm pays considerably higher wages than those paid by European locomotive works it is able to compete with European factories, partly through the greater industry and intelligence of the American workman and partly by much larger use of machine tools and improved machinery. (231.)

(d) *Drop forgings*.—Mr. REDFIELD says that in the shops of J. H. Williams & Co. wages in many of the departments are paid under the piecework system. In the die-making departments daily wages are paid, and the rate is from \$2.75 to \$3.50 per day. (663.)

2. *Fines*.—Mr. HARRAH says that his company fines its men severely. He supposes that between \$5,000 and \$6,000 a year in fines is collected from its 3,400 employees. The money does not go to the company but to the benefit fund of the men. There is no objection to the system. (352.)

XXV. OPTICAL INSTRUMENT TRADE.

A. Conditions of capital and business.—1. *Queen & Co.*—Mr. GRAY, secretary of the Manufacturers' Club, Philadelphia, states that his firm, Queen & Co., makes optical instruments, surveying and engineering instruments, electrical testing instruments, and high-class physical apparatus for colleges. It has some patents, but relies less on patent protection than on the form and quality of the instruments. For instance, it makes a cable-testing apparatus which it sells all over the world and on which it has a substantial monopoly, though it has no patents on it. Anyone else might make the same apparatus, but he would have to make a large investment in tools, which perhaps he would feel the possible trade would not justify. Queen & Co. have established a trade for the apparatus, which justifies the possession of these tools. (205.)

CXXIV INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

2. *Import trade.*—Mr. GRAY says that perhaps 20 per cent of the goods that Queen & Co. sell are imported. In some cases single articles of classes which are not made in large quantities are desired and can be imported for less than they can be made for here, especially since there is no duty on them if they are for the use of educational institutions. In many cases, however, there is a demand for foreign instruments, simply because the younger professors have studied abroad and have an idea that it is the proper thing to have European instruments. Queen & Co. import things which could be got better and cheaper here to suit the taste and fancy of certain individuals. For instance, the University of Pennsylvania required a certain number of microscopes. Queen & Co. offered them at a price somewhat lower than that at which they could be imported free of duty. The professors who actually intended to use the instruments examined Queen & Co.'s, and were fully satisfied with them and wished to buy them, but the head of the department had studied in Germany and believed in German instruments, and the university bought the German instruments at the higher price. (208, 209, 212.)

3. *Export trade.*—Mr. GRAY says that the firm of Queen & Co. does a considerable export trade in some lines of optical instruments, but the goods that are exported are American models which have been worked out by American ingenuity and which sell because of their superiority. (213.)

4. *Tariff.*—Mr. GRAY says that on a large part of the goods manufactured by Queen & Co. there is no actual tariff protection. There is a duty, for instance, on microscopes, but it is not levied on instruments imported for institutions of learning. For every microscope sold to an individual two are sold to an institution. In selling to the institution it is necessary to meet the free-of-duty price, and the firm desires to hold the trade, even at unprofitable rates. This necessarily fixes the price to individuals. The material used forms a comparatively small part of the cost in this line; labor is the important factor. Though wages are very much higher for this kind of work in the United States than in Germany, the difference is overcome by division of labor and by special machinery and tools. It would be of great advantage to the optical instrument industry in the United States, however, if the paragraph which permits free importation for institutions of learning were changed. (212, 213.)

B. Conditions of labor.—1. *Nationality of workers.*—Mr. GRAY states that Queen & Co. get their skilled help either by employing foreign-trained workmen of mature years or by training up young people under the tuition of the foreign-trained workmen. The majority of the employees in the factory are now natives, though many are children of foreigners. (211.)

2. *Wages.*—Mr. GRAY says that the principal maker of fine microscopes in Europe is Zeiss at Jena. That establishment pays what it calls standard workmen \$8 a week. Queen & Co. pay the same grade of workmen \$31. The hours of work here are 10 a day. They are longer at Jena; Mr. Gray thinks 12. For skilled workmen of lower grade, Queen & Co.'s wages go down to \$15 a week and Zeiss's to \$4. Yet the German instruments do not sell, as one might suppose, far below the American. The American firm makes up the difference in wages by division of labor, and by the use of special tools. The German standard workman makes all or nearly all of the instrument. In America the corresponding workman is supplied with parts partly finished by special tools. The rougher work is done by machinery and by less skilled men, and he has only to do the finishing. (211, 212.)

CXXVI. SHIPBUILDING.

A. Development.—1. *Philadelphia as a shipbuilding center.*—Mr. CHARLES H. CRAMP, president of the William Cramp & Sons Ship and Engine Building Company, says shipbuilding has been the prime industry of Philadelphia since the founding of the city. William Penn began the promotion of shipbuilding in Philadelphia, though, as a matter of general modern interest, shipbuilding in Philadelphia has to be dated from the close of the war of Independence. From 1781 to 1790, during which years the defense acts of the Continental Congress remained in effect, the records, though somewhat imperfect, show that at least 163 vessels, aggregating 18,000 tons registry, were built in Philadelphia. Excepting the *Alliance*, a frigate presented to the King of France in 1784, which was of 732 tons, no ship larger than 300 tons was built at Philadelphia prior to 1790. From 1790 until the outbreak of the war of 1812, Philadelphia easily led the country in shipbuilding, particularly in regard to the size and quality of the ships built. The supremacy of Philadelphia in shipbuilding at this time Mr. Cramp attributes partly to the excellent quality and great quantity of timber in the region tributary, and partly to the skill and aptitude of its shipwrights. In the period of depression which followed the war of 1812, Philadelphia constructed considerable tonnage for foreign countries, consisting of both merchant ships and men-of-war, and including one

line-of-battle ship which was sold to Russia. In 1830, two Philadelphia ships, originally built for the China trade, were sold to the English East India Company. This raised such a fuss in England that action was taken by the British Board of Trade which resulted in closing the British market to American-built ships, the British authorities insisting that their merchants must have their ships built in England, even though they had to import construction materials. When the transition came from wood to iron, and from canvas to steam, William Cramp and his sons found that "the task of perpetuating the supremacy in shipbuilding of Philadelphia in the new era practically devolved upon them." Philadelphia, Mr. Cramp thinks, has been in the lead in everything pertaining to naval architecture since 1710. (401, 403.)

2. *Beginning of steam navigation.*—Mr. CRAMP states that steam navigation was inaugurated in Philadelphia by the building for John Fitch of the first American steamboat, which, in 1790, began regular trips between Philadelphia and Trenton. A second steamboat was launched in 1791, but when nearly completed was driven from its moorings by a storm and wrecked. After this steam navigation on the Delaware languished for several years. In 1809 another steamboat line was established to run between Philadelphia and Trenton. This was successful, and steam navigation on the Delaware has since been uninterrupted, though it was many years after the establishment of that line before steamships began to cut any important figure. (402.)

3. *Iron battle ships.*—Mr. CRAMP says that the pioneer seagoing armored battle ship of the American Navy was the *New Ironsides*, built by his company just previous to the outbreak of the civil war. At that time armored-ship construction was in its infancy, and, except for the few ironclad floating batteries employed at the bombardment of Kinburn in the Crimean war and the armored frigates *Warrior*, of the English navy, and *Couronne*, of the French navy, there was no guide as to either design or construction of ironclad vessels. The United States Government determined to build the most powerful cruising ironclad that the facilities of the country would admit, and the *New Ironsides* was the outcome of this determination. The ship was of an entirely unique design, and was generally considered the most formidable seagoing ironclad of the time. Although the *Ironsides* would appear crude now, she was a remarkable achievement and proved invulnerable to any of the ordnance of that day. In 1868, while lying at League Island, she took fire, burnt to the water's edge, and sank. (398, 399.)

4. *Shipbuilding in 1870.*—Mr. CRAMP says that in 1870 there was a considerable revival of national spirit in an effort to regain the position of a maritime commercial power which the country had lost through the civil war, and as a result the American Steamship Company was formed. For this company the Cramp Company constructed four steamships, known as the *Indiana*, *Illinois*, *Pennsylvania*, and *Ohio*. These ships were commissioned in 1872 and 1873, and excelled in speed the *City of Brussels*, which was the fastest trans-Atlantic steamer of that time, although the *City of Brussels* burned 1,000 tons of coal per trip and had 100 men in the fire room, while the American ships burned less than 500 tons of coal and had only 37 men in the fire room. These economies were the result of the introduction of the compound engine. These ships made 8-day trips, and for a time attracted their share of trans-Atlantic traffic, but finally succumbed to the competition of their subsidized British rivals and passed under the control of the International Navigation Company. (399.)

Mr. Cramp says that when these four ships were contracted for the foreign steamship companies increased their output of new ships and built larger ships than had been their practice. As a result it came about that by the time the American ships had started and made one or two voyages freights had fallen to one-half or one-third of what they were before the contract was made for the building of the ships. (400.)

5. *Shipbuilding on the Pacific coast.*—Mr. CRAMP says that shipbuilding started on the Pacific coast during the years 1885 to 1890, when the Union Iron Works got some contracts from the Government. The Pacific coast shipyards, he says, have been devoted mostly to the building of war ships, but a limited number of coastwise boats have been built there.

Ships for the Pacific trade have been built in several Eastern yards—in the yards of the Newport News Company, in the yards of Charles E. Flint's Company, and at Chester and elsewhere. (408, 404.)

B. Conditions of capital and business.—1. *William Cramp & Sons Ship and Engine Building Company.*—Mr. CRAMP states that the William Cramp & Sons Ship and Engine Building Company was founded by William Cramp in 1830; that in the 64 years of its existence, to the end of 1893, the number of men employed had increased from less than 100 to 5,600, and that the pay roll had grown from a

CCXXVI INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

few hundred dollars per week to \$54,000 per week. In addition, an enormous amount of labor is employed and large sums are paid in wages by contributory industries upon which the shipyard relies for material. The number of names on the pay roll in 1900 was 6,850 and the amount of wages paid about \$81,000 per week. (397, 416.)

During the first 63 years of the existence of the company it constructed 289 ships, and in the 23 years during which a modern engine plant has been part of the establishment 141 engines of every description and capacity have been manufactured. From the end of 1893 to December, 1900, when Mr. Cramp testified, the company had constructed 80 ships, and 11 were still in process of construction at that time. Of these 41 ships 7 were for the United States Navy, 2 for the Russian navy, 1 for the Japanese navy, while 2—the *St. Louis* and the *St. Paul*—were built to engage in trans-Atlantic trade under the American flag. (397, 400, 401, 416.)

Mr. Cramp thinks that the success of the Cramp Company may be viewed as a case of survival of the fittest. He says that when William Cramp founded the company in 1830 there were 12 other shipyards in Philadelphia, none of which now survive except the establishment of Neafie & Levy and that of the Charles Hillman Company. The survival of the Cramp Company he attributes to the fact that when the change from wood to iron came the Cramp establishment was the only shipyard prepared to meet the new conditions; the other shipbuilders could not, or would not, and therefore their shipyards passed away. (398.)

2. *Equipment of American shipyards.*—Mr. CRAMP says that his company has better appliances than have any of the shipyards abroad. Facilities for doing work are better in this country, though since the engineers' strike Great Britain is making greater use of American devices and inventions. (414.)

3. *Cost of ship construction.*—Mr. CRAMP says that it is impossible to give a direct positive or negative reply to the question whether a ship can be built as cheaply in the United States as in England, it depends partly on the ship and partly on the builder. The average English tramp ship could not be duplicated in America, because American shipyards could not reduce their standard to that of tramp construction. In respect to the highest class of vessels, Mr. Cramp thinks that the proper form of the question is not, "Can you duplicate the *City of New York* (for instance), or the *Majestic*, or the *Columbia* (using the word "duplicate" in a purely structural sense), for the cost of these vessels in Great Britain?" but the question should be, "Can you build a ship to do the work of the *City of New York*, or the *Majestic*, or the *Columbia*, in all respects, for the same cost?" To that question Mr. Cramp would reply, "Yes; or within as small a margin as would be likely to prevail in a similar case between any two British shipyards." Every great shipyard of long existence acquires methods, systems, and practices peculiarly its own, and these are expressed in the vessels which it designs and builds. The prices for building steamships would therefore be different in different shipyards. When a Japanese company went to England to get a lot of ships built, they got 16 different bids from different British shipbuilders, and the difference between the highest and lowest bids was 30 per cent. It is, therefore, not possible to give a direct answer to the question whether a ship can be built as cheaply in the United States as it can be built in Great Britain. Making a rough estimate, however, Mr. Cramp would say the cost of building an American first-class steamship and a foreign first-class steamship would differ by about 15 per cent. (405, 407, 408, 414.)

4. *Advantages possessed by the United States.*—Mr. CRAMP says that in a few years both England and Germany will have to come to the United States for the raw material for the building of their ships. (411.)

5. *Profits in shipbuilding.*—Mr. CRAMP says that there is not a business where there is less profit than in shipbuilding, if the immense amount of ability required to construct a ship is taken into consideration. The profit on shipbuilding on contracts given by the United States Government is ridiculously low, and in merchant shipbuilding it is still lower. In England it pays better because of the prices they pay for the materials that go into the construction of a man-of-war. (430.)

6. *Combination.*—Mr. HARRAH, president of the Midvale Steel Company, does not think that there would be any advantage in combining plants for shipbuilding and for producing armor and ordnance, except that if such a combination chose to keep war ships in stock in a speculative way it would be likely to make a mint of money when a war broke out. (356.)

Mr. CRAMP says that it would be a ridiculous thing to form a combination of all the shipyards, and that it could not be done. (417.)

7. *Building of Government ships.*—Mr. CRAMP states that when, in 1872, the matter was investigated by a committee of which he was a member it was learned that every engine that had been built for a British man-of-war for 20 years had been built in a private shipyard. That is one of the many reasons why Great

Britain became superior to us at the time of the civil war. The constant practice of building vessels in private shipyards and paying handsome prices for them built up great engine shops with great machinery, and when the British were building vessels for the merchant traffic they were all supplied with great machines and trained workmen. All the iron and steel ships that were built for the British Government at that time, and continuously up to the present time, have been built in private yards, and liberal prices have been paid for them. In the case of five ships built by the Lairds for the British Government the contract price was large enough to enable the company to build a separate dry dock for each ship. (Great Britain, in time of war, could use those additional dry docks for repairing vessels. Private shipyards were built up at the expense of the British Government, and they afterwards afforded powerful aid in the building of great British fleets. There are no battle ships or cruisers being built by Government yards in this country at the present time. Some years ago two cruisers, the *Raleigh* and the *Cincinnati*, were built in the Government yards. One was built in the Norfolk Navy Yard and the other in the New York yard. (408, 416.)

8. *Competitive bidding.*—Mr. CRAMP says that when a trans-Atlantic steamship company decides to add a vessel to its fleet it does not submit its plans, specifications, etc., to a number of shipyards for competitive bidding. As a rule each company has its particular or favorite builder, and the builder's type of ship becomes the company's standard. Although there are many shipyards in Great Britain, there are not more than 8, or at the outside 4, yards which would be considered by any of the great steamship companies as competent to build first-rate modern vessels, such as are now required for trans-Atlantic mail and passenger service. The plan followed in building such ships is to charge the company for materials and for labor, and then to add a certain amount for operating expenses and a certain amount for profit, terms and percentages being fixed. "It may be," says Mr. Cramp, "that there are good reasons why the United States Government should to a great extent tie both its hands and those of the contractors by inflexible written stipulations, under bond and penalty, but no such conditions are imposed in transactions between steamship companies and shipbuilders of established rank, for the simple reason that both would be subjected to probable or possible embarrassment thereby; and experience demonstrates that it is better to leave the questions of detail to the operation of the common rules of business as encountered in the progress of the work." Mr. Cramp states that the contracts for the ships built for the British Government by the Lairds were not secured through competition. The British Government knows who can build these ships, and it notifies them that it will give them a battle ship for so much money. If they want it they can have it; if they do not want it they need not take it. And that is the way their ships are got out. (406, 409.)

9. *Extension of shipbuilding plants.*—Mr. CRAMP states that for a number of years he has been endeavoring to enlarge his plant and to extend its capabilities to the point of building a first-class war ship complete, ready to go into action when delivered, including not only hull, machinery, and equipment, but also armor, guns, and ammunition. That is his idea of what the capabilities of a shipbuilding plant should be. As far as possible the divers industries which enter into the construction of a ship of war should be under a single management, in order that the best advantages of experience may be realized. In his efforts to extend the scope of his plant Mr. Cramp states that he has laid his scheme before various people, before the Bethlehem and Carnegie establishments, and the Midvale Steel Company in this country, and before the Armstrong Company and the Vickers Company abroad. The desirability of having a plant of such scope has been more than justified by the phenomenal success of the Armstrong Company. That company builds fully equipped war vessels, and is now employing 15,000 men and paying dividends of 20 per cent per annum, most of which is made on the guns and ordnance matter. The Vickers Company is also prepared to turn out complete ships ready for action, and the same is true of other companies in Great Britain. The Krupp have bought the Germania shipbuilding plant at Kiel, and are prepared to furnish complete ships, and now have a large number of vessels under construction, 5 of them for the German Government. The shipbuilding plant of Forges et Chantiers, at La Seyne, France, is also ready to build complete fighting ships, ready to go into action when delivered. There has never been a time within 30 years, Mr. Cramp says, when, if his company could have built a war vessel complete, as it would build it, it could not have made 30 per cent over the ordinary prices. The extension of the capabilities of a shipbuilding plant in this way is a totally different proposition from a combination or consolidation of shipyards. It would conduce to the more perfect independence of one shipyard, and would be in line with what has already been done. Formerly the various departments of the constructive trades which are now embraced in one shipbuilding plant were entirely independent of each other. The shipowner made separate contracts for

the building of the hull, for painting, blacksmithing, ship smithing, spar making, sailmaking, and rigging. In the case of steamships separate contracts were made for hulls and engines. As a result there was difficulty in fixing the responsibility. If a ship failed to come up to the required speed the shipbuilder would put the blame on the engine builder, and the engine builder would put the blame on the shipbuilder. This method of subdivision increased the cost of a ship. A trans-Atlantic steamer, which can now be built for \$3,000,000, would under the old method of subdivision have cost \$8,000,000. (418-420.)

10. *Displacement and registry tons.*—In explaining the difference between displacement and registry tons, Mr. CRAMP says that displacement tons are used in warship practice and represent the weight of water actually displaced by the hull. If the ship should be put into a pair of scales and should weigh 10,000 tons, it would displace exactly 10,000 tons of water; but tonnage as applied to merchant vessels—that is, registry tonnage—is the measurement of the internal capacity of the vessel—its tons measurement, not tons weight. Tons registry is always less than tons displacement. A ship that would displace 19,000 tons would have a gross registry tonnage of not over 12,500 or 13,000 tons. The difference between gross tons and net tons, Mr. Cramp explains, is that the net tons measure the internal capacity of the ship after the spaces taken up by boilers and engines are deducted. (400.)

C. *American merchant marine.*—1. *Reasons for lack of investment in trans-oceanic lines.*—Mr. CRAMP says there are two reasons why American money does not seek investment in trans-Atlantic lines or in Pacific lines to the Orient. One reason is that it has not paid, but the principal reason is that few persons have been educated up to it. People can not make money in a business unless they are trained to it. The first cost of a ship is not the chief factor in preventing the investment of American money; it is not even a serious factor. The great trouble is the greater cost of running American ships. The greater first cost of a ship might be overcome somewhat, but the greater cost of running American ships, the paying of higher wages on American ships than are paid on foreign ships, is continuous. (404, 408, 414.)

Mr. Cramp says that the difference in the cost of running an American ship and the cost of running a foreign ship is immense. It takes an army of men to handle the 5,000 tons of coal which a first-class Atlantic ship burns on one voyage, and the men on an American ship get nearly double the amount of wages paid the men on a British ship; the stewards and others also get higher wages. (407.)

2. *Aid to shipowners generally.*—Mr. CRAMP, says that he is in favor of doing something for the benefit of the merchant marine by giving shipowners some compensation of some kind. He is not disposed to hold to any particular plan to the exclusion of all others, but is ready to accept anything that will be effective in counterbalancing the disadvantage under which we now suffer from the greater expense of running our ships. (409, 413.)

3. *Discriminating duties.*—Mr. CRAMP has always been in favor of discriminating duties, and thinks that the imposition of such duties would be a very good method of upbuilding American shipping. It would involve the necessity of abandoning some of our treaties, but that is no objection, as we have never made a treaty that was to our advantage. (412.)

4. *Subsidies.*—Mr. CRAMP says that the payment of ship subsidies would be for the benefit of everyone in America. The opposition to the subsidy bill was centered in the great trans-Atlantic steamship lines of Great Britain and Germany. To the opposition of these lines was added the opposition of a large number of smaller foreign steamship companies. Many of the Western railroads also joined in the opposition. The fight was not an open one, but the tactics of the opponents of the subsidy bill were veiled under every conceivable form and device. (410, 411.)

Mr. GRAY, secretary of the Manufacturers' Club, Philadelphia, is doubtful of the wisdom of subsidizing ships. He believes that it costs more to run a vessel under the American than under a European flag, and he is very doubtful of the wisdom of offsetting that difference with subsidies. (207, 210.)

5. *Registry of foreign-built ships.*—Mr. CRAMP refers with approval to the "sturdy patriotism" of the First Congress, which, when commerce was languishing for want of vessels, nevertheless prohibited the registry of foreign-built ships. He himself, however, as one of an advisory committee, agreed to the policy of admitting a foreign ship to registry, provided that one were built in American shipyards of equal tons and class, his reason for so doing being that it is necessary to get vessels, and that at present the shipyards are not large enough to furnish a sufficient number of ships to supply the demand. Also, he was willing to make a concession to the free-ship men. More ships are wanted in this country, and in order to have more ships built here Mr. Cramp is willing to make the sacrifice embodied in admitting a foreign ship to registry, provided a ship of equal tons

and class is built in an American shipyard. The admission of foreign-built ships up to half the American tonnage would be politic now, because there is a great deal of carrying trade to be done, the carrying trade of the world having been demoralized by the South African war. (402, 409, 410, 411.)

Mr. Cramp says a lot of Americans are buying the worst kind of foreign ships. As a consequence of the increase which there has been in the dimensions of ships, British shipowners are selling their smaller ships to American bargain hunters. (404.)

6. *Demand for ships.*—Mr. CRAMP says that there is an enormous demand for vessels, due largely to the fact that the British Government took for transports and colliers in the South African war a great many of the British ships engaged in the trans-Atlantic trade. Another reason for the great demand is that the United States has taken vessels from the coastwise trade for transports. The demand will not in any way be met by the return of the transports taken by the Governments when the wars are over; the vessels will be obsolete then and worthless. It is very destructive to use a merchant vessel as a transport. (411, 412.)

Mr. Cramp says that the Germans have now got complete possession of the carrying trade of the North Atlantic and England will never recover it again. There is a chance for America to get in if the right means are used. (411.)

7. *Underclassification of American ships.*—Mr. CRAMP says that American ships are underclassified by Lloyd's. (414.)

8. *Ships in the coastwise trade.*—Mr. CRAMP says that with the exception of those ships registered under the wrecking disability act, he has never heard of a ship engaged in the coastwise trade which was built elsewhere than in an American shipyard. (404.)

D. Improvements in naval architecture.—*The Holland boat.*—Mr. CRAMP says, referring to the Holland submarine boat, that if any boat can creep around under the battle ships and blow them up battle ships will not be of much use. Whether this can be done is another question. Naval men do not seem to fear it. The fear of the submarine boat or ram or torpedo boat is principally the fear of the unknown. There have been many reports during the last 40 or 50 years of sudden revolutions which were to take place in naval architecture and bring about a new order of things, but they have not materialized. Great revolutions do not occur. The great changes which occur in battle ships and other ship construction are of slow growth. Every year will produce better guns, every year will produce a better ship and better armament, and we will continue to have the older ones at the same time. So will all other nations. In any case, it is highly important to have a great plant with every facility for quickly producing the highest and best types of old and new. (421.)

E. Conditions of labor.—1. *Nationality of workers.*—Mr. CRAMP says that a large number of workers in his shipyard are Americans. He has workmen whose ancestors for seven generations have been shipbuilders. The men who come to this country from British shipyards are for the most part of the least desirable class. They are usually men who are dissatisfied or discontented and who are quarrelsome. (415.)

2. *Employment.*—Mr. CRAMP says that employment in shipyards is more continuous in Great Britain than in the United States. (415.)

3. *Wages.*—Mr. CRAMP states that in 1894 he had a careful examination made of the books of two Clyde concerns and made a comparison between wages paid in America and the wages paid in Great Britain, with the following result:

Trade.	British rate.	American rate.
Pattern makers.....	\$9.00	\$18.00
Machinists.....	8.50	15.00
Riveters.....	7.50	12.00
Beam and angle smiths.....	8.40	15.00
Holders-on.....	4.20	9.00
Fitter-up.....	7.50	15.00
Ship carpenters.....	9.00	18.00
Joiners.....	9.00	18.00
Painters.....	9.00	18.00
Ship-shed machine men.....	7.20	15.00
Furnace men.....	6.00	10.80
Riggers.....	7.20	11.00
Plumbers.....	9.00	15.00
Drillers.....	8.40	11.00
Sheet-iron workers.....	8.50	15.00
Coppersmiths.....	8.00	13.00
Molders, iron.....	9.00	14.50
Molders, brass.....	9.00	15.00
Labourers.....	4.20	8.00-9.00

COXXX INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

Since that time wages have been raised both in this country and in Great Britain. The wages in the two countries are a little nearer together than they were 20 years ago. There is a little difference in the wages paid in the East and on the Pacific coast, wages being slightly higher on the Pacific. The wages paid by the Cramp Company and the Newport News Company are about the same. (413, 414.)

4. *Apprenticeship.*—Mr. CRAMP says that, as a rule, his company takes the children of its workmen as apprentices. The preference is given to them. After they are placed the company takes on outsiders. (416.)

5. *Labor organizations.*—Mr. CRAMP says that the workers in his yard, the riveters, and pattern makers belong to organizations, but the reins are not held very tightly, and when they were all ordered out on a sympathetic strike they did not go. The men in his yard are generally governed by the circumstances governing the yard itself. There has never been occasion for him to receive committees from the men to discuss wages, etc. (416, 417.)

XXVII. EVIDENCE NOT DIRECTLY RELATING TO MANUFACTURES.

A. *Evidence relating to transportation.*—1. *Pere Marquette Railroad Company.*—Hon. WILLIAM W. CRAPO, chairman of the board of directors of the Pere Marquette Railroad Company, says that 3 roads united to form the Pere Marquette Railroad Company. The united system has been in operation since January, 1900, and controls 1,800 miles of track. It has a system of car ferries across Lake Michigan, connecting with the Wisconsin roads, and thus makes a through line from St. Paul to New York and eastern points. The road connects at Port Huron with the Grand Trunk; at Detroit with the Vanderbilt system, Wabash, and Canadian Pacific, and at Toledo with the Pennsylvania system. There has been no increase of freight charges or passenger rates since the consolidation of the roads, and there has been no decrease of wages to employees. There has been, however, an increase of earnings, because the separate roads have thrown their traffic over the entire line so far as practicable instead of allowing it to be dissipated at junction points and delivered to other roads. (538, 539.)

2. *Interstate Commerce Commission.*—Mr. CRAPO is not in favor of giving to the Interstate Commerce Commission the right to fix rates in the first instance. The railroad managers are more competent to compute the cost of transportation and the tariff required on different classes of freight than is any board of railroad commissioners. It might be practicable to require approval by the Interstate Commerce Commission of the rates fixed, and that would perhaps protect the railroads from one another to some extent. It is probable that it would be beneficial to the commission, in making its findings upon complaint, to be able to compel the railroads to come before it and make defense. The commission might report its findings to a court with suggestions, and then the complaint could take the form of a judicial inquiry, the finding of the Interstate Commerce Commission not to go into effect until final judgment. It would depend upon the nature of the grievance whether or not it would be desirable to require the case, if contested in the court, to be advanced upon the docket. (539, 540, 541.)

3. *Pooling.*—Mr. CRAPO says that the prohibition of pooling has led to abuses by the railroads. It has been found that when the railroads engage in warfare against themselves the public suffer. Destructive competition, by means of rate cutting and the giving of rebates, has led not only to railroad bankruptcy, but to the making of discriminations in favor of particular shippers, the discriminations being always in favor of the large shippers and against the smaller ones. If pooling should be allowed under the supervision of the Interstate Commerce Commission, it is not likely that harm would come from it. (539.)

4. *Consolidation of railroads.*—Mr. CRAPO says that the unification of smaller and weaker railroad companies into one strong system results in greater economy in operation, and also furnishes greater facilities for the conduct of a satisfactory public service. Where the union of railroad companies is based upon present values, and is simply for the purpose of improving the service and strengthening the financial conditions, such union will prove successful and of advantage, both to stockholders and to the public. (539.)

5. *Transit-in-bond privilege.*—Mr. CRAPO thinks that New England would be very much injured if the Canadian railroads were shut off from transporting Western products into New England. There is quite a movement of cotton from St. Louis, which comes up through Toledo and Detroit. Some of it passes over the Pere Marquette road and is delivered to the Canadian Pacific or the Grand Trunk for transportation to New England. Flour from Minneapolis is carried through Wisconsin across Lake Michigan and across the State of Michigan and

delivered to the Grand Trunk for transportation to Boston. That route is shorter by 192 miles than is the route by way of Chicago over American lines, and it would be a great disadvantage to New England if that transportation should be stopped and everything forced on to the south side of Lake Erie. (540.)

B. Treatment of delinquents.—1. *Indeterminate sentences.*—Mr. Woods says that Massachusetts has a habitual criminal act, under which young criminals are first put on probation and then sent to reformatories. If it seems then that they are becoming habitual criminals, they can be sent for a longer time, even to the extent of a life sentence. Mr. Woods thinks that this principle should be applied to all delinquents, including the pauper, the drunkard, and the prostitute. A special type of institution is needed for such delinquents, especially in the early stages. It should carry with it the minimum of disgrace and the maximum of training. If, under suitable training, a delinquent improves and promises to be a useful citizen, he should be released; if not, he should be retained. (201.)

2. *Establishment of a penal colony.*—Mr. LIONEL J. SALOMON, treasurer of the American Rattan Company, thinks that it would be a good idea for the United States to establish a penal colony somewhere in the Philippines, as England did in the case of Australia. Many of the inmates of the prisons would, if separated from their associates, make good citizens. (721.)

3. *State control of children.*—Professor COMMONS says that the State of Minnesota has practically wiped out the hoodlum element of Minneapolis and St. Paul through the action of the Board of State Guardians for Children. This board has authority to take children from parents who are unable to control them. They have been doing this work for nearly 20 years. The effect of it does not depend altogether upon the actual number of children taken, but largely upon the moral effect which the possibility of such action has. When a child is taken away from one family a good effect is produced on the neighbors. The same system is used in Massachusetts. (45, 46.)

TESTIMONY.

MANUFACTURES AND GENERAL BUSINESS.

WASHINGTON, D. C., November 9, 1900.

TESTIMONY OF RT. REV. H. C. POTTER.

Bishop of the Episcopal Church for the diocese of New York.

The commission met at 11 a. m. Vice-Chairman Phillips presiding. At that time Bishop H. C. Potter was introduced as a witness, and, being first duly sworn, testified as follows:

Q. (By Mr. CLARKE.) Will you please give your name, profession, official position, and post-office address?—A. H. C. Potter, bishop of the diocese of New York; 29 Lafayette place, New York City.

Q. We understand that you are here to give us information on the subjects of arbitration and the laboring men, in their sociological aspects. We shall be pleased to have you go on in your own way without leading questions, and state what you wish on these subjects.—A. I may say, in the first place, that the first issue about which I should be disposed to talk with the commission in regard to this whole business would be the matter of the use of terms. It would interest you—and that, I think, really would be of value, because it is part of the history of the interesting movement—if I say that my relation to labor and to laboring men, and to questions of wages and the like, which divide laboring men from employers, grew out of a movement in the State of New York some years ago, perhaps 10 or 12, part of which was the cooperation and initiative of people who otherwise were far apart, such as my friends Dr. Felix Adler, Mrs. Josephine Shaw Lowell, President Low, and two or three large employers of labor, and two or three labor leaders, including a walking delegate. We were brought together for the purpose of considering the organization of a board or society or commission, whatever it might be called, for the purpose of interposing in a reconciliatory way between workmen and their employers, and at the outset we discussed at considerable length the question of what we should call ourselves.

It will sound paradoxical if I say so, but we consider that our organization was of value, likely to be of valuable service, mainly because it was directly unauthorized. We were self-constituted; we were not created by the State, and I think our experience has vindicated the wisdom of our being an absolutely voluntary and self-constituted body. Nobody asked us to organize, and nobody in any official way has given us any authority, and yet we have been able during these years to be of very considerable use to a very various body of workmen.

In the matter of organization, as I say, our first question was as to how we should designate ourselves. We rejected the term arbitration because of its connection in the mind of the workingman, particularly, with bodies created by the legislature, and we wanted to preserve the voluntary elements in the whole thing, and we wanted to be modest, so we called ourselves and are to-day the Board of Mediation and Conciliation. We were composed as I have described. The secretary of the board was and is a typesetter. Before a great while we came to be known to workmen, and our assistance was invoked in a number of strikes. A very interesting one was the marble-workers' strike, which involved all the men who were marble-workers in and about New York City, whether they were marble sawers, planers, carvers, or setters, and which included a negotiation which covered some two or three weeks. In these meetings or gatherings for the purpose of bringing workmen and their employers together we maintained from the start the most absolute informality, and we encouraged the greatest

2 INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

unreserve in the expression both of opinions and convictions about facts. We met originally in a room in a building which is the official residence and headquarters of the bishop of New York. It is called Hobart Hall. This is a room and hall of a good deal of stateliness and dignity, fashioned exactly after the House of Lords, and is furnished with oak and red leather and with terrace seats—all that sort of thing. We got together there, workmen sitting on one side and the employers and the gentlemen who represented various colleges, like President Low, and others on the other side. We found the whole business exceedingly stiff and formal, and the character of the room itself and the distance at which we were from each other satisfied me after a meeting or two that we were not going to get the workmen to talk freely. When you oblige a man to get up on his feet at a distance from everybody else, having everybody criticising his clothes and manner, and so on, you are likely to get him at his worst. So one evening I said that the next meeting would be held at my house; and after that we sat at our table in my study like this—and I hope it will not shock you if I say we smoked and drank coffee—but we got down into the whole thing, through conversation and the social element, in such a way that we never would have gotten it otherwise. There were two tendencies which, in presiding over this meeting, I had to encounter. One was the tendency on the part of the employer to crowd the workmen when the workmen's statement of facts were not quite correct and precise, for which he had no training, of course, and an ill nature, which the French would describe as *de haut en bas*, from above to below that I checked instantly. I said, "You must remember, gentlemen, we are all equal in this room for the time being. I shall expect you to put restraint upon yourselves and to address anybody you are speaking to with careful courtesy and consideration." After while I got the workmen to speaking with great unreserve, and, what is of the most value, I got them to feel there was going to be fair play there without respect to any class or caste; that every man was going to have a good show. In that way we begot in the minds of the men whom we brought together there a disposition to recognize that there was no ulterior motive in the existence of this commission; that we were not a furtive body got together for the interests of capital, but there simply and only to serve both sides as far as we could and to create an atmosphere of mutual conciliation and mutual good understanding.

I should say distinctly that the highest services which that commission has rendered in the city of New York are not the services it has rendered in the individual cases of strikes and so on, but in the implanting in the minds of the working people the idea that there was a body of people in New York who represented things that were supposed to be of value—influence and character and position, etc.—who were on their side; who wanted to see fair play. I do not think anything ever touched me more than when I got through arbitrating this great strike with the marble-workers, the men who represented the workmen and the others, also, who were on the commission of arbitration asked me to go with them and have us all photographed together. That picture hangs in my house as one of the most precious heirlooms which I hope to leave to my children, because it was a symbol of the fraternal relation of human society. There you have gotten at the bottom fact of the whole business. The problem in modern life in any organized society is to prevent alienation and this misapprehension of classes; that, from the growth of wealth in a republic is just as great as in an empire. People drift apart. Not one of us in this room who is familiar with the early history of our country can fail to recognize the enormous contrast in social conditions to-day from those that existed 50 and, much more, 75 years ago. In a smaller community such as I grew up in—Schenectady, in central New York, or a village such as in Otsego County, in which I spent my boyhood—the life of the community was one. If there was poverty, it was recognized and known about, and the conditions under which it came about were known. If there was intemperance, that was recognized; and the ne'er-do-well people were not left as they are in modern life to an experience of such profound indifference, and the distances between the top and the bottom were so much less than they are to-day that the tendency was to help people mutually to understand one another. The mischief of the growth of wealth and luxury in a country like ours is that it practically destroys that condition. Of course when you go to the great metropolitan communities you get the foreign element, and you have got a condition of remoteness of a large portion of well-to-do people from the other people which is not less than their remoteness from the condition of people in the Philippine Islands or in Borneo—don't know any more about them; don't know how they live. The sad part of it is they do not want to know, as we do not enjoy hearing things painful to us. So, when issues between labor and capital come about, the element that is discreditable in it is the profound ignorance of intelligent people as to what brought them about. The story of the sweat

shops of New York, for instance, is a story which well-to-do people turn from, when they find it in the daily paper, as something unpleasant, and they do not want to read about it. It is a solvable problem. Something can be done to better the condition of the people who are being crushed by the injustice of sweat-shop work. We have not got far enough to feel that the thing that lies at the bottom of the relations of capital and labor is first of all to touch that enormous apathy, and somehow or other to move it and to weaken it." In that regard I am free to say myself that I am far more hopeful of voluntary organization for the reconciliation and mutual interpretation of one another by capital and labor than I am of legislation. Curiously enough, last winter, coming home from India, I met a gentleman who came from New Zealand, and I asked him about the working of this system. "Well," he said, "it is working very well so far as the conditions of capital and labor in New Zealand are concerned, but they are very elementary conditions, and it is extremely doubtful whether you could get them to work effectually under the more complex conditions of labor and capital in greater communities." That, I think, in any recommendation which such a body as this commission might make in regard to legislation, might wisely be considered. Just how far legislation should go is a principle concerning which there ought to be, from a body like this, an explicit deliverance, and a recognition of the fact that the great moral processes of moving a community are not in the shape of laws. There are features in the New Zealand scheme which I think of great value. The feature, for instance, that one of the arbitrators should be nominated by the representatives of organized labor is of great value, because if there is one thing that ought to be done explicitly in any pronouncement or declaration that is made in this country, it should be the recognition of the right of the workmen to organize. That should not be a debatable question any more, and it should be stated in a manly and unreserved way. And if he has a right to organize, he has also a right to be represented in any enactment which is made either by the State or Nation. The other feature, of course, is that which provides that another member of the board should be a capitalist or labor employer—call him what you please. That a judge of the Supreme Court should be the third and presiding member of this arbitration board struck me as being a provision of great value. But the weak point in it is that it is coercive. If either side demands arbitration then the other side has no discretion about it. It is competent for both sides to settle a difference about wages in some other way; but if one side goes to the authorities and demands arbitration then the other side must yield to it. Of course there you touch the question of the value of involuntary mechanisms, or any great movement of the sort. The law is simply the expression of a moral sense of a community, and unfortunately is too often so much beyond it that it suffers from what Mr. Cleveland I think would describe as innocuous desuetude. We have plenty of illustrations of that, as you know, in the city of New York just now.

The one point I wanted to bring out was that of aid. I believe in the value of somebody or commission which should exist for the purpose of interpreting, I like that phrase best, the labor organization and the capital organization to one another. I regard that as likely to be efficacious, if it is a voluntary organization, bringing us to see that underlying the whole question of the relation of capital to labor is the duty of a citizen, and especially the well-to-do citizen, to set himself to try to understand it. The mischiefs of the wild talk of labor are not greater than the mischiefs of the wild talk of capital. You get any body of men ordinarily talking about these questions and you will be amazed and disheartened by the reckless way in which they make statements which have no sufficient foundation in fact. This is fatal to the construction of any social order. I can say for myself, and I think I can say for my associates in the Board of Mediation and Conciliation of New York, that we have found our relations to workmen a daily education to us; that we have found in them a degree of intelligence and especially an instinct of fairness with which they are rarely credited; a disposition to be careful about statements of fact, and to recognize the tendencies of exaggeration among their own number, and to assist us—assist me particularly—in my relations with them in reaching conclusions, by making sacrifices. I should describe very imperfectly my experience with the work of bringing the workmen and their employers to an understanding if I did not say that I had been impressed with the disposition of the workman, if he saw that a concession on his side was likely to be met with a concession on the other side, to hasten to make it. The popular impression that the workman always wants to stand out in a sort of rigid and unreserved way for his demand is not in accordance with my experience.

Q. (By Mr. CLARKE.) Have you discovered any lessening of the opposition to the organization of labor in recent years?—A. Yes; distinctly. I think our

4 INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

American instinct of fairness, a national quality, is illustrated in that. I have been very much struck with the frank acknowledgment of the perfect right of workmen to organize—and in some cases on the part of the employers, with the expression of the wish that they would—for the reason that they would much rather deal with a body which had a certain responsibility, from the fact that it was an organization, than with irresponsible persons. And then, too, I have been impressed with the disposition of employers to readjust their points of view with reference to particular features in labor organizations which at first were particularly offensive to them. As I stated, in this body to which I refer, we have had now and then what are called walking delegates. Well, a walking delegate is a particularly obnoxious personage to the employer, and I remember very well a discussion on one occasion where a large employer of labor said: "Why is it that we can not deal, when there is a strike, with our own workmen; that all the negotiations must be carried on through an outsider with whom we have no relation whatever—who is a walking delegate? Do you not see you would stand a better chance of getting good terms if you were a workman of ours and came to us with two or three of your associates and said, Mr. So and So, we do not think we are getting a fair wage and we are going to pull out unless you do better by us? Do you not think we would rather discuss these questions with you than with persons who are entirely irresponsible and have no relations with us whatever?" The young man said: "Yes; I can quite understand that from your point of view." He then told how that worked so far as the workman is concerned. He said: "I have been engaged in this branch of industry for a great many years under various employers, but I have always noted this fact, that whenever a body of employees appointed a committee of three men or two men or one man to go to the employer and represent what they thought would be fair as to wages, whether or no the demand was conceded, that particular workman, or these particular workmen, sooner or later disappeared out of this gentleman's employ." "Now," he said: "you would admit we have got to have a representative; somebody must speak for us, and if a man can not speak for us without it be at the cost of his place, we have no right to ask him to make that sacrifice. So you must take somebody outside of any place and we must take care of him ourselves and have him as our representative and pay him." I was very much impressed with the whole scene, which was rather dramatic.

Q. Have you discovered any improvement in the manner of negotiating between masters and men in recent years?—A. Yes; I should say so, if by manner you mean the readiness of employers and laborers to conduct the inquiry upon certain predetermined lines and hold them to these lines.

Q. They are more diplomatic and less rigid and incorrigible?—A. Exactly. They are more intelligent, I think, in that respect in all departments of labor—certainly with which I have dealt and been connected. For instance, in this marble workers' strike, there you have got what is purely a manual task, for the men stay at one end of a big saw and move it to and fro, or move something to polish a piece of marble. You would say that is about as low a type of industry, as little intelligence required, as you could find, and yet the intelligence of the men who are doing that work or those who speak for them, aiding them, is something always interesting and encouraging. In this particular strike to which I refer we had Italians, Germans, Irishmen, and Americans, and yet there was not any choice as to the clearness in which they made their points known, or their readiness to consider a point in opposition, or their capacity, apparently, to do so. I should say for myself that my impression of the average intelligence of the workmen was very greatly raised by my personal dealings in cases of this sort of strikes.

Q. Has there been any noticeable improvement in the disposition of employers to be fair toward their employees?—A. Oh, I think so; distinctly. It seems to me that the mental history of the process is substantially this: Your first instinct and mine, when anybody undertakes to interfere with our private business, is to say they can not do it. I saw in the West somewhere—in Chicago, if I am not mistaken—something of the sort. There is now an organization of servant girls. Before taking situations they demand certificates of the character of their lady who employs them. I can imagine a woman saying that is intolerable; yet it is perfectly reasonable, and there is a point of view also from which it would be perfectly equitable. I certainly, if I am going into your employ, have the right to know first of all whether you are solvent, whether you are competent to pay my wages, and then whether it is a decent house, if I am a pure young woman, and whether I am going to compromise my character. To take the thing back to the larger aspect, the employers have recognized very frankly the demands of the workmen which they fought in convention, and their right of private

judgment in discussion, which capital is bound to respect. In that way I think a betterment of public sentiment, so far as I have encountered it, has come to pass.

Q. Since you began to study this question has there been a great improvement in the material and moral condition of the working class in New York?—A. I do not know whether I should use the adjective "great." There has been an improvement, and I think it could be said to be a cooperative improvement. I think the condition of the homes of the poor is better in New York than it was 10 years ago, or, still more, 20 years ago. The legislation in the direction of improving the homes of the poor has been on the whole judicious and wholesome, and has been fairly well enforced. The disposition of a number of capitalists to erect a class of tenement houses of an improved kind, which shall have sanitary conditions and moral conditions, in the direction of the protection of the virtue and decency of families, has been very marked, indeed. It lags a long way behind what we ought to have done. There is a strong disposition, however, to press for greater improvement in that direction. I think there is abundant evidence of it. A movement of that sort gets cumulative force and gains fast. The experiments in regard to improved tenements have on the whole been encouraging and reassuring.

We get in a great city like New York, as you all know, a vast mass of people who come to us from all kindreds and tongues, and a great many of them have first of all to be educated up to a certain standard of decent living. I do not suppose there is one person in ten thousand who realizes the character of New York in that particular. If I may volunteer to mention it, one of my clergy came to me not long ago and asked me if I would give him a letter to a rector in order that he could get the use of a chapel for services for Mesopotamians. Now, I should not like to embarrass any gentleman in this room by asking him where Mesopotamia is. This clergyman was a native Armenian and has charge of an Armenian congregation. He said to me, "I should like to have services for these Mesopotamians." I said, "Really, can't you have the handful of these Mesopotamians come to your congregation?" He smiled and said, with an air of superior knowledge, "Perhaps you do not know" (I certainly did not), "but the Mesopotamian tongue is utterly different from the Armenian. What is your idea of a handful?" "I suppose there may be 25 or 50 of these people here." He said, "If you will come with me this morning, within three blocks of where we are at this moment I will show you a settlement of 800 families of Mesopotamians, of which the city of New York is just as ignorant as it is of the condition of Dahomey. If you go into their houses you hear nothing but their tongue spoken." I asked him how they came here and what they were doing. He said they were brought over by corporations, companies that manufacture cheap jewelry; that was their particular art, and they were good workmen.

To come back to the tenement house and all that, you can't teach a person who has lived in the East and with Eastern ways to use a Western house and Western conveniences at first with much success or respect, but that process of education in the large foreign elements is getting on well and hopefully, and among them there are a great many very estimable, self-respecting, and excellent people. You can not dismiss any race or nationality in New York en masse and say they are a bad lot.

Q. As a whole they are a thrifty people, are they not?—A. Very thrifty. Whether they are anarchistic or revolutionary in their tendencies, they find that their wage gives them a chance to put away money, and the socialist and proletariat becomes conservative just as soon as he gets money in the savings bank. He is not destructive any more. That is the process that is going on. The history of the small accounts in the savings banks is one of the most dramatic stories in the history of a great State.

Q. Do these people shortly after coming begin to improve in their habits of dress and living?—A. Oh, yes.

Q. Do you know of any organized effort to teach them Western ways?—A. Yes. For instance, I have a good many of them in those schools of ours which are down in Stanton street, New York, of which you have probably heard. Stanton street is in the most densely populated ward in the world, not excepting Canton, with as many people as are there, because the buildings are so high. We have there sewing schools and gymnasia, and especially cooking schools and other departments of industrial training. All these people come without any reference to their religious associations or traditions, and they are very apt, indeed. I should be very glad to have you come down and see our cooking school and see if you could do better in the way of a chop or omelet or rice pudding. We should be very glad to serve you there.

6 INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

Q. Is this like the social settlement of the Hebrews?—A. Yes; it is like all that work which is described in Chicago, New York, and elsewhere as college-settlement work.

Q. You say that these Mesopotamians were brought here or induced to come here by the manufacturers of cheap jewelry?—A. That was my information. Of course, it was not a case of contract labor. They came in families and came of their own motion; they take their chances without exception.

Q. Do they begin to work for lower wages than the average American scale prevailing in that industry at the time of their arrival?—A. That I can not say. I have no means of knowing. This clergyman of mine had no information on that subject at all.

Q. Has any labor difficulty arisen with that class of people within your knowledge?—A. No; not with that particular race. The Hebrews have had difficulties with their employers, and we have interposed in such cases once or twice successfully; not always.

Q. Are most of the employers of Hebrews themselves Hebrews?—A. Yes; so far as I know.

Q. Do you think that labor is as well rewarded voluntarily by that class of employers as by others generally?—A. I do not think it is as well rewarded voluntarily by anybody as it is likely to be when you get some organization or mechanism which presents the claim of labor in a forcible and intelligent way. I do not suppose you or I would be likely to pay our coachman as much, or our cook as much, as if we were not aware that the lady in the next house was willing to pay her more. I do not see why you have not got the principle which governs the whole question. A workman is, of course, worth what he is not only to you but to somebody else, and I suppose one of the great services which organized labor renders to those who are associated in it is that it brings to the mind of the employer in a concrete form the justice of its demands. Human selfishness, in other words, is not as sensitive to the other fellow as it ought to be.

Q. Granting the truth and force of what you have stated in that matter, let me inquire if you do not think there is a growing disposition on the part of employers to recognize justice in the matter of wages, and also that there is an enlightened self-interest by having a very large consuming population living somewhere near up to the standard of liberal wages?—A. Most inspiring. I should then go further than that. I should say that apart from enlightened selfishness there was a human instinct, a fraternal instinct, in the minds of employers to-day which was widely diffused all over the world. It exists in France to a most impressive degree, and in England to an equally impressive degree, and here. I do not think that the popular mind in its devotion to the working people does justice to the growth of that or finds illustrations of it right under its eye in shops and factories, of which I have personal knowledge—painstaking efforts for the comforts, the well-being and health of employees. The disposition to consider them as fellow-creatures, men and brethren, I think is one of the most encouraging notes in the whole social labor problem to-day. For anybody to take a pessimistic view of it is both unjust and reprehensible. The thing behind it you have got to recognize is that in all such matters the great enemy of good is ignorance, and that as the value and truth of enlightened relations between the classes breaks upon the minds of people they take hold of instrumentalities for bettering them. But you take the great shops in New York like Wanamaker's and Macey's, and others—I have often thought that nothing could be more valuable than that some one should prepare a paper and illustrate it in order to show what great employers are doing for the comfort and well-being of their people, and how that is an illustration of the large improvement found in a great many cases.

Q. Do you think that tendency is increasing?—A. Yes.

Q. Are the tenements of New York, inhabited by the industrial population, owned largely by people of large means?—A. That is a difficult question to answer. I should say from my own knowledge not nearly so largely as is generally supposed. I think that great owners of real estate in New York avoid that kind of property now as an investment. It is troublesome; it needs constant vigilance. The question of repairs is very serious, especially where you have got people who are reckless in the way of water and faucets and windows, and things that are destructible. My own impression is that the great owners of real estate seek a class of property above that. I fancy tenement property is owned very considerably in New York by Hebrews, and that it is owned a good deal by people not of great wealth; but I have not, I ought to add, such definite information as makes my judgment of any value.

Q. Do you not think that the elevation of the industrial classes depends very largely upon the houses in which they live?—A. Yes; largely.

H. C. POTTER:—ARBITRATION.

Q. Is there any organized effort in New York to bring influence to bear upon the owners of these houses to improve them?—A. No; no organized effort that I know of. The movements such as are represented by college settlements include a very high class of citizens, public spirited, representing wealth and traditional social culture and influence, and that is very considerably enlisted undoubtedly in that direction, but you can't call it an organized movement.

Q. Has there been legislation on that subject?—A. Yes; a good deal of it.

Q. Has it had good effect?—A. I should say so on the whole; yes. Of course it depends very much upon the efficiency with which it is enforced, and there you get down to the question of an efficient police system.

Q. Do you know whether or not the trade unions have given any attention to the subject?—A. I do not. I think that is one of the defects at present. For instance, in the building of tenement houses we have not succeeded in getting in small shareholders. We never shall achieve any great results in elevating the conditions in any great or small center unless we can unite classes at both ends. So long as model tenement houses are built for people and not by them, and owned for people and not by them, you come back to what I said a moment ago of the dangers of the attitude toward the laboring man *de haut en bas*, the attitude of condescension, which is the most mischievous element you could have. The efforts in France in that direction, unless I am misinformed, have been very successful. Of course they are troublesome, and they do not tempt capitalists who are using their money for business; but if we could get organizations of capitalists and laboring men together, in which the laboring men could be shareholders, to however small a degree, and have some vote and direct interest in its maintenance and the betterment of the fabric, I think that should make a move forward of very great value. That is in the air, but I think it is coming.

Q. I understand you to say, speaking of the New Zealand system of arbitration, that you regard the compulsory feature as a weak element?—A. Yes; I do.

Q. You would not think it advisable to introduce that in this country, then?—A. No; I should apprehend bad results from that. First, an antagonism to it as a coercive method of settling questions of great delicacy and difficulty, and then the inevitable endeavor, in which we are very skillful people, to circumvent the law in some way, to get around it and dodge it. It would be a dead letter, and that is one of the most vicious features of the history of statutes that I see—that there are so many laws that are dead letters. It is a great principle which we ought to nail up on the sky, it is the best government that governs least. Making laws ought to be regarded as only worse than not having any laws. Having a moral sense in a community to do a thing is ten thousand times better than law. The difficulty about any law like that of New Zealand is that our relations between capital and labor are so delicate and complicated that there would be so many instances in which, by some ingenuity, the law would be circumvented.

Q. You think the law should in some tentative way encourage arbitration?—A. Oh, decidedly. If you could have a law which should provide just the New Zealand mechanism without the coercive feature in it, it would, I think, be of great use.

Q. How would it impress you to have the requirement in the law that whenever a labor dispute arises which is liable to become acute, arbitration must be offered?—A. Not absolutely, though that would have been the line to have taken the other day in Pennsylvania. There was no doubt about the readiness of one side there to arbitrate. That whole condition was accentuated and the employers ultimately beaten because they would not arbitrate.

Q. It is your belief, then, that public opinion largely favors arbitration?—A. Most distinctly, and that it would be of great moral value to put a person who was in the wrong conspicuously in the wrong in the public eye.

I would like to read a passage from Mr. Lloyd's book as to the New Zealand system. I think it is a capital system with the elimination of that coercive feature.

(Reading:) "The court of arbitration consists of 3 persons, who hold for 3 years, appointed by the governor-general, and of the 3 appointees 1 must be chosen by him from men nominated by workmen."

That is a discreet proviso. Suppose the workmen appointed directly. They might choose the most offensive man they had; but they must choose, I suppose, 2 or 3, and the governor-general may take any one of them.

(Reading:) "And 1 from among men nominated by the capitalists."

There must be 2 or 3 nominated, and the governor-general must have an option.

(Reading:) "The third is a judge of the supreme court. This democratic representation of labor and capital insures to each throughout the proceedings that their interests are protected by men of their own class familiar with the com-

8 INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

ditions of their life and industry. It insures that the casting vote of the chairman is given with men by his side to make clear all the technicalities and difficulties of the questions at issue.

"The selection of a judge of the supreme court to preside and to give the final and decisive vote satisfies the contestants and the people that the state, on its side, contributes to the inquiry and the decision the best it has of dignity, experience, and impartiality.

"If the question before the board or court is of more than usual complexity, 2 experts may be chosen by the 2 parties to act as full members of the court and to see that the decision is made with full understanding of all the points. Experts are frequently called in in this way. For special emergencies there may be special boards elected.

"Neither board nor court intervene in any dispute of their own motion, but, like other courts, only when one of the parties or both appear before them. The compulsion in the law is not that the state of itself compels the parties to arbitrate, but that if one desires to arbitrate instead of fighting the state says the other must not fight, but arbitrate."

Q. (By Mr. CLARKE.) Do you think that the fact that they have no strikes in that country, and that compulsory arbitration is successful, is due to the primitive and simple conditions there compared with our own, and that that principle might not work well here?—A. Well, yes; I think that is just precisely the key to the whole situation. The dominant class in New Zealand is the agricultural class, not the manufacturing class. In our Western phrase, New Zealand is run by farmers; you can not say that of the United States. They have got a very simple and elementary community there as compared with ours.

Q. Have you discovered any strong opposition to the compulsory feature of arbitration among either employers or employed in this country?—A. No; I can not say that I have any information that would enable me to answer that question.

Q. It is a matter of theory, then, and not demonstration?—A. Undoubtedly, entirely; it is all my own impression; it is, of course, of no value as far as the testimony is concerned.

Q. Would you consider that even compulsory arbitration, objectionable as that feature of it may seem, would still be a less evil than a prolonged strike or lock-out?—A. Yes, I should think so; at any rate I should be quite willing to acquiesce for my responsibility in legislation of that sort which might be experimental in character. Certainly no intelligent person can feel that a strike per se is anything less—in its physical conceptions, I mean—than a reversion to the primitive type, as the ethnologists would say. It is going back to barbarism. You can not settle questions of that kind in that way; and we ought to have got far enough, in a civilization like ours, to settle questions of that kind in some other way than that which involves the demonstrations which usually accompany strikes. But, as between the two, I should feel that certainly it was worth while to attempt the experiment involved in legislation even of a compulsory character, though I should not be very hopeful about it.

Q. Have you studied the subject of organization by workmen and by employers enough to come to any conclusion as to what are the proper limitations of such organization?—A. No; I should not like to answer that—to define that. Of course, as to both cases, a person situated as I am is a layman, he is an outsider, and he would look at it in a larger and a looser way.

Q. (By Mr. FARQUHAR.) I think the commission would like to learn something from you about these so-called college settlements; the initiative of them, and how they have progressed, and what is the effect of them.—A. The college settlement you have in mind is that of Mr. Reynolds, and I see you will have him here in a few days as a witness. The college settlement is one of the most interesting developments as confirming what I said a moment ago as to the hopefulness of the present situation. Of course, in great centers a great deal of what may be called humanitarian work has been done; as, for instance, I am working under ecclesiastical auspices, and it has been done under religious features. But equally there are a great many people to whom that relation would be embarrassing, and there are people who feel very keenly, too, particularly in the case of young men, the misery and wretchedness of a great many social conditions that exist in connection with capital and labor, and you recognize—as Mr. Wyckoff has done, whose admirable paper, I think in Scribner's lately, gave, I think, much the most valuable testimony of an experimental character in regard to the condition of the laboring man in America to-day—the keen interest in the minds of college men in these questions. The college settlement grew up originally out of the desire of college men in England to get closer to the laboring classes, and because of their keen apprehension of the danger of alienation of classes. The

first of them was the famous Oxford House in London, which was founded and organized, as you know, by a number of Oxford men who went and lived in what we would call the slums here, and interested themselves in the social conditions and recreations of these people who are at the bottom of the social scale. Then there followed the interesting and very notable experiment which, from the name of its founder, was called Toynbee Hall. Mr. Toynbee was a gentleman of fortune who came out of Cambridge and founded this hall, which, if you ever go to London, I hope you will go and see; and there you will see one of the most marvelous illustrations of wisdom and sympathy and tact in dealing with the conditions of the working masses in London. As to what may be done here in this country, undoubtedly the success of those experiments produced in this country the college settlement; and the college settlements in New York, Chicago, Boston, and elsewhere, are houses in which young men live in community and in which, for a certain period in the year, they give themselves to live among those people to study their social conditions and enter the service. They give from 1 to 2 or 3 months; men give their whole summer vacations and spend their whole time there. We have such a house in what is called pro-cathedral work in Staunton street, New York, in which men come from all over the country and live in the very simple way in which we provide for them there—the plainest living; and they teach classes and they visit and they do whatever we order them to do. Now, those things are existing all over the country in great cities. They are certainly most inspiring and interest the very best element, so far as the future is concerned, of the young men in effecting any great betterment of social conditions. They have all sorts of schemes for providing recreation and declamations and debates among those boys. They get at them. However, that is Mr. Reynolds's problem, and when he comes he will tell you; and I wish you would ask him to tell you of the work that is being done in what is called the Nurses' Home, under the auspices of Mr. Jacob Schiff, a great Hebrew banker of New York, a man of very high character and quality, who has maintained at his own cost in different parts of the city two or three houses in which gentlewomen of refinement live and do most useful work in connection with women.

Q. Has the Episcopal Church, outside of its own special church organization, any society that cares for these working classes?—A. Not outside of parochial organization.

Q. All simply that one?—A. Yes.

Q. You have no general society, then, in the city of New York?—A. No.

Q. What success have you met there in your church organization in the care of the poor and the outcast?—A. Oh, most remarkable, most encouraging in awakening in them good and decent ambitions, and creating a feeling of enthusiasm for service on their own part. Of course, those are stories that can not be told in public; but one of the things that we very imperfectly recognize—those of us whose conditions in life are more favored—is the high instinct and genuine nobility and unselfishness which may exist under conditions which would seem to us to be most hopeless, conditions of great poverty and often want of employment, and great pressure in the direction of evil living, if they wanted to go that way for a piece of bread. I spent some 6 weeks, 8 or 4 years ago, during midsummer, in our community house in Staunton street, and I devoted a large part of each day and evening to receiving anybody who wanted to come to me about any conceivable trouble. There were a great many factories shut down in the neighborhood; there was a good deal of poverty, of which I had reason to know more directly. I was there about 6 weeks, and during all that time, while I had all kinds of visitors, days and nights, young men, young women, grown people, and boys and girls, in all kinds of sorrows, and shames, and troubles, I never was asked for a penny. It was known that I had behind me the Episcopal Church of New York. But while I was asked for all kinds of counsel and sympathy, I never was asked for money, directly or indirectly. I had gentlemen who wrote to me from Albany, and Brooklyn, and Jersey City, who said I was down there to be struck for dollars; but that was all. Now, what are you going to think about people who are of as fine fiber as that, the most redeemable quality in our social order? They have just the same sympathies, and character, and purity, and self-respect, and chastity, and honor, as you and I have.

Q. What means of self-help do they use there in your churches, industrial schools?—A. Yes, we have industrial schools of two or three kinds. We have savings banks, and a kind of organization for boys, personally conducted; and the young girls' clubs are administered by ladies who know the lack of these girls with whom they are in constant touch. It is the sympathetic nerve that is awakened, and kept throbbing, and saving society, after all.

10 INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

Q. Does the interest in this reform permeate the congregations generally, or is it left largely to a few ladies who put forward their own special efforts?—**A.** That is rather a large question. I should say that the sympathetic interest is a growing one all the time and that it is very considerable. Of course the element of active service and helpfulness does not represent a majority of any given congregation, for instance, though it represents a growing element in it; and the large consecration of wealth for that kind of work in the city of New York is something that the modern world has no idea of. If one could see the buildings in connection, for instance, with such a church as Grace Church, New York, over on the East Side, the vast and beautiful structures that they have reared there in connection with their settlement work, and up in Ninety-second street, I think, where one old Dutch family, the Rhinelanders, have built a most beautiful model group of buildings of the same kind, you could get an illustration of what is being done and what the world never hears anything about or takes into account.

Q. Do you think that these organized communities are enlarging very much in New York with your denomination?—**A.** Yes.

Q. Does your hope lie very much in the church organization to carry forward this reform at first?—**A.** I think that is a matter of indifference. My hope lies most in the individual. I am not a machine man. I do not believe in an institution of charity. An institution of charity is a mechanism which opens the door for personal contact, and I believe in the growth in the popular conscience of the community of a sense of personal responsibility and in the development of a capacity for service. The great difficulty to-day is that the business or professional man or woman of society has ordinarily so little aptitude for doing anything; very much like that young woman who, during the civil war, insisted on bathing the head of a soldier. He said, "Well, Madame, you can do it if you want to, but you are the fourteenth lady who has done it this morning." She said, "Well, that is all I know how to do." They do not know how. But you will be very much surprised to see what is being done, and you would be surprised to go to St. George's Church, New York, and see the Bible class of 250 young men that Seth Low teaches every Sunday morning. You will be surprised at how much of that kind of thing is done; it is a social savor; it sweetens the whole air. There is one word I should like to say in connection with the report of the arbitration by me of this lithographers' strike in New York, and that is that whatever wisdom there is in that paper is largely the product of the brain of my friend Dr. Felix Adler, to whom I was greatly indebted in connection with the preparation of it.

Q. (By Mr. CLARKE.) When did that strike occur?—**A.** That occurred in 1896.

Q. In what book is this report?—**A.** (Producing book.) In this Tenth Annual Report of the Board of Mediation and Arbitration of New York. And in that connection I should like, if I might venture, to suggest that you would get nobody in our part of the world whose judgment and scientific knowledge would be of any more value to you than Dr. Felix Adler's. He knows this question in all its forms.

Q. (By Mr. FARQUHAR.) In the settlement of that lithographers' strike in New York in 1896 you made a decision shortening the hours of labor. Could you give the commission your views on the economic or the social reasons involved in shortening the hours of labor?—**A.** I should say generally that I was influenced in that decision by the conviction that the human mind has in departments of higher activity—and lithographic work as a mechanical art comes under that description—power of so much sustained attention that, after a certain time—and the analogy there holds good in all mental exercises—that power is not only greatly weakened, but it becomes so far debilitated as to invalidate the excellence of the work. Applied to other forms of labor, it would be possible for a man to do a longer stint of work without fatigue. But I think that the quality of his labor is so much better with the shorter hours that from the purely economic view it is worth while to shorten it; in other words, that the employer would gain.

Q. Your decision, I believe, was for 47½ hours?—**A.** Yes; a week.

Q. Then, would your judgment be that the hours of labor ought to be regulated by the conditions of the workingmen?—**A.** I think so. I do not think you can make any hard and fast general rule. You and I would not like it.

Q. In other words, it should be gauged by the efficiency of the person himself and lack of efficiency, being extended as a basis, over a period of say 7 or 8 or 9 hours?—**A.** Yes; be gauged by the efficiency of the man and by the nature of the task, what the work takes out of a man. Talking to railroad people, I find that there comes to be a very definite conception of the length of time during which a man can stand in front of a throttle valve and run an express train. And that must be determined by what he is doing; applying such principles as that, I mean.

Q. Was not this feature involved in that strike—that if Mr. Bean and the other employers who were involved in this disagreement should agree to very much shorten the hours their competitors working outside of the organizations would have the benefit and the trade would be apt to pass away from those who made concessions to their workmen in shortening the hours?—A. I do not recall that particular feature of the decision now, but I should say that you can not take a step in any right direction without apparent consequences of that sort. You must make a beginning somewhere. It must impinge upon somebody, and the hope is that you can pull up the whole line to a higher standard.

Q. While you believe in voluntary arbitration and not in the rigidity of State arbitration, do you not also believe that associated employers themselves and their workmen are more apt to settle these disturbances between themselves than by calling in the State or outside parties?—A. Most distinctly. Leave the arbitration business on the outside. It is far better that you and I should get together in a room and settle a difficulty between ourselves without referring to anybody outside.

Q. Do you find in making your arbitrations that the employers regard you as outsiders—you a clergyman and others of different professions—invading their rights to deal with their men?—A. Yes; I do.

Q. Do you find in almost all cases that employers regard it as an invasion of their rights for outsiders to take any interest in their business?—A. Yes. They treated us with a condescending, complacent courtesy, but they did not see what business I had with it, and I was perfectly sensible of that. You can not have an arbitration without it. But I am quite ready to believe that the whole theory of arbitration should be regarded as a dernier resort—something to go to when you have got past the other. The ideal society is where, of course, organizations or individuals, being at issue with one another, come together and talk it over and come to an agreement with each other. That is a much higher order.

Q. You said that strikes had the elements of and were really a relic of barbarism. Since the dissolution of the old guilds, do you not think that strikes were necessities on the part of workmen?—A. Oh, yes. War is a necessity.

Q. Do you also think, as a general proposition, that until the employees are satisfied of the existence of force enough on the part of the employees to meet them, as well as probably the justice of the propositions, that they will contend against any enlargement of wages or shortening of hours?—A. Inevitably.

Q. And your desire is to bring in the element of fair play and conciliation and mediation before you resort to arbitration?—A. It is, yes.

Q. (By Mr. PHILLIPS.) You speak of the difficulty of regulating these subjects by law. Has not the situation in the city of New York been greatly benefited by the factory inspection laws and laws pertaining to the sweat shops?—A. Oh, yes. I should distinctly except all law which involves the turning on of the light. That is another question.

Q. The sweating system has been very greatly improved by the factory laws?—A. Oh, yes, indeed. That is a case precisely analogous to the case of inspection of public institutions by persons appointed for that purpose—institutions which are supported by the State. That was the great fight that we had in New York in connection with the creation of the State Charities Aid Association and the Charity Organization Society. There must be somebody with the right to go into any hospital or asylum that was receiving public money and see how it was conducted. That right of visitation was a sacred right. Legislation of that kind is always valuable.

Q. Do you think the State can accomplish anything important in regard to the unemployed by means of legislation?—A. I am not sanguine in regard to that, no. I think we have great natural laws which are at work, and that while it might be conceivable that it would be worth while in certain emergencies to assist people in finding labor—as in transporting them long distances—that on the whole when the State goes into that business it interferes in a way with the freedom of action of individuals. I am greatly in favor of teaching the liberty of the citizen. You can make a law that gets me out of bed at a certain hour or dresses me at a certain hour, but that is not making the man; that is not a man; that is not manhood.

Q. (By Mr. LITCHMAN.) I have understood from your remarks here that you were disinclined to so-called compulsory arbitration. I would like to hear your opinion as to how you would meet a difficulty where the employer is represented by a large aggregation of capital, such as a trust or combine or corporation, that absolutely refuses to arbitrate or to enter upon any mediation or conciliation with a large mass of men that are employed by it, and where it is such an enterprise or occupation that the public at large suffers through the cessation of employ-

12 INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

ment or through the dispute between the employer and the employed—how would you reach that?—A. I know no coercive way to reach that that I should care to recommend.

Q. I merely wanted you to go just a step further and say whether or not in an instance of that kind the power of the State may not justly be invoked to compel some sort of a settlement, on the ground that the interest of the public at large is of sufficient importance to prevent the suffering that necessarily ensues.—A. Such a situation is conceivable, but I confess I should have more hope in the ultimate value of sound public opinion in coercing the corporation, and as being worth while to wait for that.

Q. But we are now in a transition state, which is bringing to us a different condition of employment both as regards employers, as represented in the manner I have stated, and the employed. Large aggregations of capital are taking the places of the individual corporation and the individual employer, and remedies which were easy of application where the employment was between man and man or between one corporation and its men are not as applicable under conditions where these combinations get together in larger aggregations; and I wanted to know whether you had thought that out sufficiently to give us a suggestion.—A. The remedy for that is in the more thorough and extensive organization of labor. Labor has always lagged behind the other and will sooner or later come up to it.

Q. You think there should be a general organization of labor?—A. Yes.

Q. To meet the organization of capital?—A. That should have the help of men of brains and capital who are not laboring men. There is no greater service that men of brains and character can render, I think, than assisting an intelligent organization of labor.

(Testimony closed.)

WASHINGTON, D. C., November 10, 1900.

TESTIMONY OF MR. H. W. STEINBISS,

General Secretary-Treasurer of the National Building Trades Council of America.

The commission met at 10.45 a. m., Vice-Chairman Phillips presiding. At that time Mr. H. W. Steinbiss, of St. Louis, Mo., was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. CLARKE.) Will you please give your name?—A. H. W. Steinbiss.

Q. Post-office address?—A. St. Louis, Mo.

Q. And official position?—A. General secretary-treasurer of the National Building Trades Council of America.

Q. When was this national organization formed?—A. December, 1897.

Q. Is it a delegate body?—A. It is a delegate body; yes.

Q. How often does it meet?—A. Once a year.

Q. What are its relations to the subsidiary bodies in regard to their policy on labor questions?—A. Advisory and legislative.

Q. Has it an executive committee which has any power to act without instruction from the delegate body?—A. Yes; the general executive board.

Q. Has it a set of by-laws?—A. The executive board itself?

Q. Yes.—A. No.

Q. Has the national organization a set of by-laws?—A. Yes.

Q. How large is the national body?—A. Actual membership, about 250,000. I say actual because, for instance, New York, while not directly affiliated, looks to the National Building Trades Council for advice, information, and aid voluntarily. Conditions exist there which would make it not perhaps impossible but inadvisable to admit them to the National Building Trades Council, there being dual organizations of the Building Trades Council there.

Q. Are the local constituents of the national body building trades councils, or are they unions in the building trades?—A. They are building trades councils formed by the building trades unions.

Q. How many States are represented in the national organization?—A. We have St. Louis, Webb City, St. Joseph, and Kansas City, Mo.; Chicago, Ill.; Omaha, Nebr.; Cincinnati, Ohio; Milwaukee, Wis.; Duluth, Minn.; East St. Louis, Ill.; Evansville, Ind.; Sioux City, Iowa; Edwardsville, Ill.; Alton, Ill.; Worcester, Mass.; Fort Worth, Tex.; Dallas, Tex.; Peoria, Ill.; Kenosha, Wis.; Waukegan, Wis.; Jersey City, N. J.; Belleville, Ill.; Savannah, Ga.; Memphis, Tenn. Those are the cities that are now represented.

Q. (By Mr. PHILLIPS.) And the States?—A. And the States.

Q. (By Mr. CLARKE.) I notice that only three Southern States are represented. Has there been less effort made to organize councils in the South than in the North?—A. It must be understood that as our organization is young there has not been much effort made outside of that officially made by the secretary. We have no organizers. It is only lately that we have appointed volunteer organizers, but not under any pay.

Q. Labor in the building trades is better organized in the North than in the South?—A. Yes.

Q. We would like to have you go on in your own way and state what efforts the national council has made to promote arbitration and conciliation in any place where difficulties have arisen.—A. There is only one where the convention has taken action, and that is in relation to the coming world's fair in St. Louis, advising the building trades council of St. Louis, in conjunction with the resident national officers, to make an agreement with the proper authorities of the world's fair to so arrange a system which will entirely preclude the possibility of a strike. The National Building Trades Council has a provision which places the general executive board as a board of arbitration in cases of strikes or lockouts, providing the local building trades council where the strike or lockout occurs asks for it. Our principle is to give local autonomy, and for that reason no definite action has been taken. The part of our constitution bearing on that subject reads as follows (reading): "Whereas it is one of the main objects of the National Building Trades Council to abolish strikes and lockouts, or at least reduce them to a minimum;

"And whereas it has been provided that wherever introduced a joint conference board or board of arbitration, composed of representatives of local building trades councils and master builders, has accomplished this result: Therefore be it

"Resolved, That we hereby request all building trades councils to work to the best of their ability to establish such conference or arbitration boards with associations of master builders wherever practicable.

"The general executive board shall hold themselves in readiness to act as an arbitration committee in case of strike or lockout when called on to do so by a local building trades council or a national body affiliated."

Now, had this been complied with by the Chicago Building Trades Council, I do not believe that lockout there would have assumed that proportion; I believe that we would have been able to settle it.

Q. Did they make no petition to the national body for arbitration?—A. No; on the contrary, they thought they could succeed alone in their own way.

Q. Did your executive board attempt to influence them to arbitrate?—A. I placed this matter before them and told them that I thought everything should be tried, but they seemed to think differently, I presume, and saw fit not to adopt it.

Q. Are the various local councils organized on substantially the same plan, or do they differ somewhat in their methods of procedure?—A. They only differ in representation, perhaps, which is governed by local conditions. For instance, where there are not many of the building trades in existence—small towns—their representation differs from those of larger cities. They have more representatives and have representatives of the different trades.

Q. In Chicago the Building Trades Council submits any proposition for arbitration or settlement of a difficulty between a union and the contractors to the whole bodies of members of the various unions affiliated with the building trades council in the form of a postal-card referendum?—A. I did not know that.

Q. Is that done in other cities?—A. No; not entirely. In St. Louis they have, for instance, a board of business agents, or what we term the board of arbitration, composed, I believe, of 24 men now. These people are elected and paid by the unions or the trades for which they are appointed. They are a part of the building trades council; in fact, the power of the executive board has been transferred to them. And they meet daily at 4 o'clock, make their reports after having visited the various parts of the city, and decide what shall be done by the arbitration committee. Their report again is made weekly to the building trades council, and is either approved or rejected—generally approved; very seldom that their reports have been rejected.

Q. In all such cases, then, the building trades council seems to possess plenary authority to determine what shall be done?—A. Not entirely so. Very important matters are referred to the union, but only on motion of some delegate. There are always delegates present who are conservative, and who do not allow the building trades council to take more power than it should.

Q. When referred to the union do they act as a body, or are they expected to vote?—A. (Interrupting.) Oh, our votes are by trades, one vote to each trade.

14 INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

Q. In that way you think that the building trades council can be of positive advantage in promoting peace rather than strikes, do you not?—A. Yes.

Q. But when it fails to act itself, and does not possess the power to act, and must submit every question to a postal-card referendum, does not that seem to you to be unwieldy, and to prevent the body from acting promptly and effectively?—A. Yes; in many cases it is necessary to make haste, to act at once; and that would be impossible with a referendum vote.

Q. Do you know of any other building trades council anywhere in the country which fails to act as a body promptly on application of a union affiliated with it?—

A. I have been under the impression, based upon correspondence had with those various building trades councils, that they were nearly all, if not altogether, organized on the same basis as the Building Trades Council of St. Louis. It is really something new to me to hear that there has been a postal-card referendum vote adopted by the Building Trades Council of Chicago. That must have been introduced lately on account of the lockout.

Q. It was testified to before a subcommission of this commission last March, when it had sessions in Chicago.—A. Nearly all of the building trades councils that have been organized have adopted constitutions from the Building Trades Council of St. Louis. Some have not even changed from our first. I had one here [producing books] that I wanted especially to read to you. My ideas of arbitration, etc., and of organized labor have undergone somewhat of a change. When reorganizing the Building Trades Council of St. Louis, this is the preamble which was adopted by that body:

(Reading) "Whereas the conditions and systems of the country having made inroads in the ranks of nearly all labor organizations, reducing their membership and threatening to attack their standard wage and 8-hour system;

"Whereas the introduction of unskilled labor and machinery has to a great extent been the cause of the loss of life and limb and faulty construction of buildings and inferior workmanship, as well as enforced idleness, to the detriment alike to the public and the dignity of the building crafts;

"Whereas experience has demonstrated and taught us that strikes are failures and frequent abuses of the boycott unjust and un-American: Therefore be it

"Resolved, That we, the members and representatives of the various building trades hereinafter mentioned and described, in order to unite the power and wisdom of our several unions to aid each other to secure and maintain an 8-hour day and a just compensation for each and every hour's work, to protect alike the public and mechanic employed in the construction and finishing of buildings, and to prevent strikes and boycotts by adopting a system of arbitration for the adjustment of all differences that may arise:

"Therefore, we, the delegates representing the different unions and organizations affiliated, pledge ourselves to accept, defend, and obey said constitution and by-laws as compiled, revised, and submitted by the committee on constitution."

Now, this is the exact wording of a preamble which was embodied in the first constitution of the Building Trades Council of St. Louis in 1894, when it was reorganized. I was chairman of the reorganizing committee. I find in the constitutions of various building trades in the United States that have only been lately organized a copy of this very preamble. It is not in the St. Louis constitution any longer because, as I stated, conditions, or rather ideas, have changed regarding the strike question. As you will see, I say here, "experience has demonstrated and taught us that strikes are failures." I believe strikes have been successful in accomplishing the end that we aim at in lieu of anything better, and therefore my ideas in 1894 and now are quite different as to the strike question.

Q. Do you agree with Mr. Powderly that a strike is an act of war and should be resorted to only after all honorable and peaceable means have been tried and have failed?—A. Yes; and we have adopted measures so as to make it the very last thing. Now, in St. Louis we have laws bearing upon that matter, regulating how a strike shall be controlled. It is interesting. Here, for instance, is article 6, which says:

(Reading:) "There shall be established as part of this council a board of arbitration or of business agents, composed of the properly elected business agents of the various unions represented in the council.

"The duty of adjusting grievances may be delegated to the board of arbitration under the supervision of the secretary as chairman and in accordance with the constitution and by-laws and instructions from the building trades council.

"The meetings of the executive board may be dispensed with as long as no cause of importance requires them; but whenever deemed necessary or ordered to do so by three members of the executive board or by the council, the secretary

shall call a meeting of the executive board. The board of arbitration is and will be under the jurisdiction of this council."

We put that clause in because we found that, for instance, in New York a state of affairs existed at the time under which the board of walking delegates was an entirely separate body, and controlled the city, and the building trades council had nothing to say—~~no say so at all~~.

Q. (By Mr. CLARKE.) Are the terms "walking delegates" and "business agents" synonymous, meaning the same thing?—A. Yes; mean the same thing. "Walking delegate" became offensive to the ear, and so we changed the name to "Business agent."

Q. Have the various councils in different cities been successful in composing difficulties?—A. I am sorry to say no. Kansas City was unsuccessful; Chicago can hardly be called successful—still pending; Memphis has been unsuccessful; Savannah, Ga., has been unsuccessful.

Q. Can you trace any cause of the failure to all these different unions, these different councils—have they failed for the same reason everywhere?—A. There are different causes. I presume that in Kansas City the introduction of party politics may have something to do with it, political factions being at war. In Memphis the attempt was made too soon to better their condition, and perhaps too radically for a council which had only been recently organized; the same perhaps applies to Savannah. They were not fully drilled into the mysteries of unionism, so as to be able to undertake a strike. I do not believe even it was a strike. I think it was a lockout. I have never got the straight of it, but they have dissolved it and are now reorganizing. We find, especially down South, a determination on the part of contractors to dissolve any organization like a building trades council if it is possible to do so.

Q. You find the same thing in Chicago, do you not?—A. Yes, rather.

Q. Is it true generally that contractors, whether themselves organized in a council or not, are opposed to the Building Trades Council?—A. Not all. The very best of builders and contractors are our friends. They believe it to be a good thing. It gives them better mechanics. They can deal with a committee rather than with every Tom, Dick, and Harry. It is a system; they prefer it. It is the small contractor, the man that hires and picks up anyone on the street that works for cheap wages, who wants these conditions.

Q. What you are now saying is applicable to organized labor in unions as well as in councils, I suppose?—A. Yes.

Q. The question is whether the contractors who might favor unions are agreeable to delegate bodies of the unions called councils?—A. The same answer would apply; the best contractors are; that is, so far as I know.

Q. Can you state succinctly your own idea of the advantages of councils?—A. I believe I could best do that by reading from some matter here. Before organizing the National Building Trades Council I was asked through the papers to state the object of such a national organization, and I explained the matter in my paper, The Labor Compendium, as follows:

(Reading:) "Having been asked by a number of people as to the origin, object, and purpose of the proposed National Building Trades Council, I would state that the necessity and feasibility of a federation of all trades employed in the building industry is not a new idea, but has been time and again advocated in New York, Chicago, and other cities. Actuated and encouraged by the signal success of the St. Louis Building Trades Council in preventing strikes among the various unions under its jurisdiction, and establishing a more friendly feeling between employer and employee by the introduction of conservatism, and a system of arbitration, which has had a salutary effect, through the publicity given it by the Compendium, in other cities who have copied after the St. Louis council, and are now reaping the same benefits, and realizing the great injury to the prosperity of our country to have different systems of wages and working hours in different sections, creating an unfair competition among building contractors, and manufacturers of and dealers in building material, I fully realized that by joining all forces of building trades with their several councils, creating new councils where none now exist, and have them all under the jurisdiction of a National Building Trades Council of America, great good could be accomplished by introducing, as far as possible, a uniform scale of wages and working hours, and by a system of arbitration abolish strikes and lockouts—at any rate, reduce them to a minimum. The matter was placed before the Building Trades Council and unanimously indorsed, and I was authorized to proceed with the movement. Having received encouraging answers from several of the most prominent members of building trades unions of other cities who had been consulted about the advisability of the undertaking, the matter was placed before the various councils in the United States, for a vote

whether in favor, as to the time, meeting place of same, and to offer suggestions as to its representation, etc. The answers came in promptly."

This gives you an idea of what we are trying to accomplish by the Building Trades Council.

Now, in connection with this we have placed before the building public—contractors, real estate men, etc., a request which reads as follows. It is in all of our literature which we send out. It was a standing card in my paper for some time:

"REQUEST TO BUILDERS AND REAL ESTATE OWNERS.

"We would respectfully request you to cause your architect or builder to specify in all contracts that 'none but men in possession of the Building Trades Council working card' be employed in the erection and the finishing of your building. By doing so, you will not only prevent the serious delay in its construction, caused by union men refusing to work with nonunion men, in obedience to the laws and rules of their organizations, but you will, also avoid the risk of having your building erected by reckless, irresponsible parties, who foist themselves upon the community with bad material and inferior work, executed generally by unreliable tramps or boys at cheap wages, frequently the cause of accidents and faulty construction of buildings.

"The great majority in the building professions in cities, who are citizens, and the best class of strangers, who are mechanics, are union men and reliable workmen, while nearly all nonunion men are unskilled and picked up from the floating population from all parts of the globe. By calling for only union labor on contracts you will invite competition in good work only, all bidders being compelled to pay the same wages and work but 8 hours per day, and you will abolish the nefarious practice of unscrupulous contractors to gamble on chances of hiring incompetent men at cheap wages to skin the work while charging the price of good and honest work.

"The Building Trades Council, represented by delegates of the various building trades unions, has been established for the purpose of aiding each other to secure and maintain the 8-hour workday and the standard scale of wages of their respective trades, to protect alike the property owner and mechanic, and to prevent 'strikes' by adopting the system of arbitration for adjustment of wrongs."

Q. Has that suggestion been generally complied with by architects?—A. Yes; to a great extent. Architects come to my office frequently to get copies of the paper (having misplaced their own) wherein I give a list of all fair contractors. [Witness here exhibited paper containing list.] This is corrected as fast as I get it from the various unions. This is a list of contractors who employ none but union men. That is published weekly and corrected as soon as I receive the corrections from the secretaries.

Q. Does that list embrace contractors in all the cities where there are building trades councils?—A. Wherever the secretary complies with the request and sends it.

Q. Has organization in building trades been proceeding with considerable rapidity in recent years?—A. Yes; remarkably so.

Q. Is there any trade which is not organized somewhere?—A. I do not think so. I know of none.

Q. Which of the trades has the larger number of organizations?—A. I presume the carpenters.

Q. Have the rates of wages been raised and the hours of labor shortened as a result of organization?—A. Yes.

Q. Everywhere, or only in certain places?—A. To some extent everywhere, more or less.

Q. You claim that better work has been done?—A. Yes.

Q. You claim that as much work has been done as under the old system?—A. I think so.

Q. You claim that a given number of men can accomplish as much in 8 hours as the same men would accomplish in 10 hours?—A. No; I do not. If that was the case, our object would fail. The object in introducing the 8-hour work day, and lately the Saturday half-holiday, is to give the unemployed work. It is entirely humanitarian.

Q. Is that the only object of the union?—A. No; the other object is that men should have sufficient rest and recreation, live more like human beings—not work and eat and sleep alone.

Q. You contend that 8 hours is long enough for men to be actively engaged in the building trades?—A. Yes; in fact in all trades. It is an old established rule: 8 hours work, 8 hours sleep, and 8 hours recreation. It is an old Masonic rule, for that matter.

Q. To what extent is that 8-hour rule in force in the different cities?—A. In St. Louis where the building trade is entirely unionized, no one can work on a building more than 8 hours; and the same applies to Chicago. The same applies to Milwaukee. In fact, in my report of last year I put that very question to the various councils, and it has been answered. It is possible that this list of questions may be useful to your honorable body. Of course it is too lengthy to give here; but your question is embodied here also, and this will give you exactly the answers thereto. Here it is:

"Have you any trades in your council who work more than 8 hours per day? What are the trades?" Chicago answers "No." Muncie, Ind.: "All of the trades affiliated with our council are working more than 8 hours, with the exception of the plasterers, who work but 8 hours per day." (That was a year ago, and since then other trades have fought for and got the 8 hours.) East St. Louis, Ill., has none; they are all working 8 hours. The East St. Louis Building Trades Council is to a great extent composed of building trades men of St. Louis who live in St. Louis, but go over there to work. In Belleville, Ill., they all work 8 hours. In Kenosha, Wis., they work 9 and 10 hours per day. In Washington, D. C., they are all working 8 hours. Duluth, Minn., the carpenters, painters, tanners, bricklayers, stone masons, electricians, and lathers work more than 8 hours. Omaha, Nebr., electrical workers and wood workers more than 8 hours. I take it they mean the outside workers in Omaha. The linemen work more than 8 hours, but the wiremen do not; they work 8 hours. Des Moines, Iowa, the lathers and painters. Elwood, Ind., all except the bricklayers and hodcarriers' unions work more than 8 hours. Fort Worth, Tex., all work more than 8 hours, except the bricklayers. Milwaukee, Wis., all work 8 hours. Danville, Ill., the plumbers, carpenters, painters, and plasterers work more than 8 hours. St. Louis, Mo., the wood workers, machinists, and cut-stone laborers work 10 hours per day in the shop, but as soon as they go on a building they must work but 8 hours. Memphis, Tenn., has no trade working more than 8 hours. Kansas City, Mo., the woodworkers work 10 hours in the shop and 8 hours on the building. These are the answers I have received pertaining to the 8-hour work-day.

Q. Why do they work longer in the shop than on the building?—A. Because there are other than building trades in the same shops, and they can not enforce the 8-hour law without enforcing it on all, and it is a difficult matter, the others not being so far advanced as the building trades.

Q. So far as physical conditions are concerned shopwork is as wearing?—A. Yes; more so, perhaps, in some trades.

Q. Less pure air; and it would seem they ought to have as short a day as outdoor workers.—A. Yes.

Q. Have you any knowledge as to the length of the working day in occupations other than the building trades in those cities where you have the building trades council?—A. They work 9 and 10 hours generally, but they are beginning to educate and are succeeding in cutting down their hours gradually. The example of the building trades is doing a great deal in bringing that about. The secret of the building trades being able to advance so much quicker is that there are only a few men to each contractor, whereas a factory is controlled by companies, and it is harder to accomplish.

Q. Does this shortening of hours in the building trade make the erection of buildings somewhat more expensive?—A. Necessarily, somewhat.

Q. Has that had any effect to deter the construction of buildings?—A. No. More men are placed at work.

Q. I did not mean to delay, but to prevent the construction.—A. I do not think so.

Q. Is it your idea that as the country grows richer it can pay more for building, and therefore there will be an increasing demand for labor in the building trades, even though it is somewhat more expensive?—A. Yes. As the hours of workmen decrease and their wages increase they are able to build, and naturally it distributes the wealth more equally.

Q. Is it a fact that men engaged in the building trades are usually residents of the place?—A. Generally, yes. In some trades they travel—lead a sort of nomadic life. In each trade there is a certain class that goes from place to place, but the majority are generally residents. This travelling of men in the building line is caused by lack of work in one place and they go to another where they find out there is a building boom, but that will eventually disappear by the reduction of working hours.

Q. Where building trades councils do not exist, are you endeavoring to establish them?—A. Yes, we are doing so.

Q. For that purpose you correspond with the unions that exist in those places?—
A. Yes.

Q. Do you visit these places?—A. Only when called upon.

Q. Before a council is established the several unions, irrespective of the interests of the other trades, manage their own labor difficulties, do they not?—A. Yes.

Q. But as one trade bears a close relation to another in building operations, you think it to the advantage of all engaged in the building trades to have a central body?—A. Yes.

Q. A central body that will determine a policy in regard to labor difficulties?—
A. Yes. I believe in organization.

Q. Does it sometimes happen that the individual union is inclined to strike when the unions in the other trades are opposed to it?—A. It has happened. Then they will not get the aid of the building trades council. They must have the consent of the building trades council to receive this aid.

Q. When there is no building trades council, the union is self-sufficient; it acts for itself, does it not?—A. Yes.

Q. Have difficulties been precipitated sometimes by individual unions, which would have been prevented if that union had been a member of a building trades council?—A. Not to my knowledge. It has not come under my observation. We have had two strikes in St. Louis—some call them lockouts—and in both instances the unions won—the carpenters and the painters.

Q. Are you aware that in Chicago the contractors express a willingness to arbitrate and otherwise treat with the several unions, but that they demand the dissolution of the building trades council?—A. Yes; I believe they have modified it since, from what I read in the papers.

Q. Are you able to tell us how many of the trades have withdrawn from the building trades council in Chicago?—A. Thus far 3, I believe; the bricklayers, the plasterers, and the iron-workers—bridge and architectural iron.

Q. Are they among the strongest of the trades?—A. Well, yes; the bricklayers notably. The general president of the National Building Trades Council lost his position by the withdrawal of the plasterers from the building trades council. We had to elect a new general president later.

Q. Have you personally had any conferences with any of the contractors in Chicago?—A. No.

Q. Have you with the members of the building trades council?—A. Yes. I was there at a mass meeting with the executive board of the Federation of Labor. There was no conference, but a mass meeting.

Q. If the council there were formed on substantially the same basis as those in the other cities, and capable of itself acting and deciding the matter in controversy, do you believe that the contractors would object to the continued existence of the building trades council?—A. I am positive the building trades council will continue to exist.

Q. You are positive it will continue?—A. Yes, notwithstanding the attitude of the contractors. It may not be as powerful; it may not embrace as many unions as heretofore—though eventually it will gain—but it will continue to exist.

Q. Is it your opinion that the building trades council should amend its by-laws and policy?—A. Yes.

Q. So as to make its influence effective?—A. Yes. Like all other organizations, when they come to grow old a lot of mistakes will come into the management that will have to be reformed.

Q. (By Mr. LITCHMAN.) In your estimate of membership do you include the carpenters?—A. Only those that are affiliated with the building trades council.

Q. Is your organization an organization originally of workmen or is it a federation of trades or organizations?—A. A federation of trades or organizations.

Q. Then it may embrace men who are already members of the Brotherhood of Carpenters?—A. Yes; certainly.

Q. Then the answer would be that your membership of 250,000 would include men who were already members in other organizations?—A. Yes, certainly. It is not a separate organization.

Q. To all intents and purposes it is a central labor union?—A. On the same basis.
Q. Only it concentrates the forces of the affiliated trades in the building line?—
A. The building line only. We admit no one else.

Q. (By Mr. FARQUHAR.) Did you intend to include, in your answer about the 250,000, the entire membership of the national organizations that are affiliated with you?—A. No, only those that are affiliated with us directly by certificate of affiliation, such as the electrical workers, the painters, the Amalgamated Sheet Metal Workers, and National Association of Steam Fitters and Helpers of America, all of whom are also affiliated with the American Federation of Labor. They are

embraced. Now, the carpenters are not nationally affiliated; nor the bricklayers. They are only affiliated through the various building trades councils.

Q. The commission desires to get this information. How many of the carpenters of St. Louis, for instance, are in your organization?—A. About 1,700.

Q. How many in Belleville, how many in Chicago, and elsewhere—in the national organization?—A. I could not give that without resorting to my book. Perhaps you misunderstand me. We have national unions affiliated with the National Building Trades Council.

Q. These you could not count, because they are not concerned in your organization?—A. Oh, yes.

Q. But the great body of them are not under your rules?—A. Yes.

Q. Do you mean to say the national bricklayers' union is —A. (Interrupting.) No; but the painters are and the electricians are; the Amalgamated Sheet Metal Workers and steam fitters are.

Q. (By Mr. LITCHMAN.) How far do these organizations contribute to the expense of the management of your organization?—A. They only contribute \$10. The national union pays dues of \$10 annually. In case of a strike or lockout they are assessed 5 cents per member per week. We could not levy an assessment on the carpenters or bricklayers, but we do on those nationally affiliated.

Q. (By Mr. FARQUHAR.) You have a per capita tax?—A. Yes.

Q. How many carpenters pay that?—A. I could not tell you that. We only ask the building trades council and national union, "How many members have you?" and that fixes the per capita.

Q. The annual dues from the body does not convey any information as to the membership of that body in your organization. That is what the commission is trying to get at. Only through a per capita tax on the membership of these affiliated organizations could you know how many are immediately concerned with your building trades council?—A. They are not included in the annual dues, but in case of strikes or boycotts there must be a weekly assessment.

Q. You spoke of a working card issued by your national council?—A. Yes [handing card to Mr. Farquhar].

Q. Do those unions that are in your centralized council have working cards of their own?—A. No.

Q. Do not the painters and others carry their own working cards?—A. Not working cards—their due cards.

Q. That is a working card if the dues are paid?—A. No; this is the only card recognized in the building trade.

Q. (By Mr. LITCHMAN.) They have this in addition to the due card?—A. Yes.

Q. Suppose there is a card issued by the brotherhood of carpenters, which is a working card for that trade, is that recognized by your organization?—A. No.

Q. You compel them to have another card?—A. The building trades council card.

Q. (By Mr. FARQUHAR.) How do you obtain jurisdiction to issue a working card of your own; who gave you authority?—A. The building trades council.

Q. That is simply an aggregation. What national body did you succeed so as to authorize a working card?—A. None.

Q. How is it that this national organization of yours can issue a working card that contravenes the trades union card of the man that pays his dues regularly?—A. That is the object of the building trades council's working-card system.

Q. How can you operate two jurisdictions at once? The working card proper of the National Bricklayers' Union is the card from the union that the man owes his first fealty to as a trade unionist and man, is it not?—A. Yes.

Q. He pays his dues there. His handicraft is there. Now, does your council make that man show a working card that sets aside his first loyalty to his union as a dues payer and man, and make that card supreme as a means of getting work for that man over his own organized body?—A. Not at all. He could not get this card if not in possession of the other card.

Q. Then, in case of trouble, dispute, or anything of that kind this working card is the basis entirely for the man's work?—A. Yes; he is not in good standing if not in possession of the card. In fact, he can not work on a building until he procures it.

Q. How did you obtain jurisdiction to issue this card?—A. By all these trades coming together and resolving to do so.

Q. Did the local organizations get authority from the national organization to do it?—A. Yes; that is where it is issued, from the secretary's office—my office.

Q. Do you issue charters or certificates?—A. Certificates of affiliation.

Q. Is there not a difficulty in your way, in that you have a divided jurisdiction over your men with national and international organized trades unions which have

20 INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

a supreme control, through the local bodies and through the executive committees, over their men, and that in no way can that control be delegated unless through the national body?—A. We do not interfere in their autonomy at all.

Q. So your council is simply a body that meets together locally for the betterment of trade in the building line?—A. And upholding the various national laws.

Q. So that your authorization is simply that delegated—simply a meeting together of delegates to lessen the hours of labor and to raise wages?—A. And to organize new unions in the building line. [Reading from constitution.] "The objects of this organization shall be the encouragement and formation of building trades councils and local unions; the closer amalgamation of building trades workmen; to establish the 8-hour work day; to abolish the contract system on public work; an equalization of wages in the different building trades crafts; a national working card; a national correspondence league; to adjust differences in our own ranks; to establish a better feeling between employer and employee; to secure legislation in the interest of building tradesmen; to secure a mechanics' lien law; to assist all branches of honorable toil, and to settle our own affairs without outside interference."

Q. In the case of Chicago, suppose the bricklayers go out from the national council there; what system have they of disciplining that body?—A. None at all, except, perhaps, not to assist them when they need assistance, but that is never practiced.

Q. What assistance other than sympathy can your national body give to any strike?—A. Financial assistance.

Q. How much have you?—A. We have our weekly assessments—that 5 cents.

Q. Have you any strike fund?—A. Not on hand.

Q. You would need to make the assessment?—A. Yes.

Q. What length of time would it take to collect the assessment?—A. The last time it came in at once from some councils.

Q. Have you any provision for a permanent strike fund in your constitution?—A. None; but it will come in time, I presume.

Q. You have no positive rule at all, either by-law or constitutional provision, for a strike fund?—A. Except that we can levy it; that is all. Of course, it must be noted that this is only the third year of the existence of the building trades council. Our laws are crude, but we will learn by experience to improve. That is the reason we have so few laws.

Q. Have you had occasion to make these assessments in aiding strikes?—A. Only in Chicago; that is all. In fact, that part was only introduced last convention, giving the executive board authority to levy strike assessments.

Q. Has the proposition been discussed by your people of obtaining from all these international bodies a certain local jurisdiction over their local unions so that you could prevent disintegration?—A. We are doing so by inviting the nationals to affiliate nationally with the National Building Trades Council.

Q. That is, you are looking now to have an affiliation of the national and international bodies in a building trades council as far as the building trades go. You want to affiliate the national body as well as the local body?—A. The building trades, yes. In fact, our final object is to get all labor together.

Q. But they could not all go into the building trades council?—A. But we could have fraternal bodies as we have in some cities.

Q. You say have in St. Louis a body of 24 business agents?—A. Twenty-four or 26.

Q. They have full delegated power from the local unions to transact all the business of the local unions?—A. Of the building trades council.

Q. As far as the men working are concerned?—A. Yes, under the jurisdiction of the building trades council.

Q. The building trades council still holds appellate or superior authority over the business agents?—A. Yes. The secretary makes his report weekly of all transactions during the week of the board of business agents.

Q. As a practical question to a trades unionist, as you are, do you think the aggregation of 15, 20, 25, or 30 local unions in a council such as you have, when you come to have a strike which concerns even the least member of your union, and that strike continues for 2 or 3 or 5 or 6 months—do you think that it is a benefit to any union to so associate themselves that they must stand with that strike simply through sympathy?—A. Ultimately, yes.

Q. In other words, are you not a little too strongly organized?—A. You can not be too strongly organized. These things could not occur if we were more strongly organized.

Q. Where you involve, as in your case, the 30 unions in your council, and your whole body has to strike on account of some dispute between one of your mem-

bers and the contractors, do you not think that involves too much wages, when a strike lasts for 2 or 3 or 5 or 6 months?—A. Possibly, at present.

Q. Suppose the hodcarriers go out, how can you have any recompense of that loss of labor?—A. That is a very bad feature of the matter, but it will eventually bring about such a change in the conditions that we will not have to strike.

Q. Does your aggregation of trades tend to make more strikes against employers than you had when working separately?—A. We aim to bring about better conditions. That is the object of organization. If we were not organized I presume that men would receive wages upon which they could not even feed their families, just as has been the case when we were not organized fully. I speak from experience.

Q. Which of the two features do you think is best for the workingman, the feature of thirty organized trades in your building trades council or a general arbitration board that can take up all the quarrels of the trades and settle them each for itself?—A. Each for itself? That would be against the policy and principles of trades unionism. In the first place, there are many trades which are small which are under oppression by their employers which are kept down, and as a matter of humanity alone and to properly elevate the other trades the stronger trades should go to their assistance, as a matter of humanity and brotherly love. An injury to one is the injury of all.

Q. What are the conditions attached to this working card of the building trades council?—A. Each building trades council must take out working cards for all its members in good standing.

Q. Do these cards carry dues with them to the council?—A. No. They show that they are members of the building trades council and have paid their dues to their national organization and are members in good standing of their various organizations.

Q. (By Mr. LITCHMAN.) Supposing you should have a difficulty under the management of your association with which the carpenters, we will say, are affiliated, and assessments should be levied to sustain the men on strike; and supposing in another locality the carpenters should have a difficulty of their own and have their men on strike; now, when this strike assessment was levied, would all in that organization pay a double strike benefit?—A. Yes; that has been the case in Chicago.

Q. What would be the effect?—A. I do not know. So far we have had no difficulty, only perhaps with one council, where they refuse to pay the per capita assessment. In one city they have not paid up in full, and it was left for the convention to decide.

Q. I would like to have your opinion of the effect on the success of labor organization of good times. When times are good and men are employed, do they pay their dues more promptly?—A. Yes.

Q. Then trades unions are generally more successful in good times than in bad times?—A. Yes.

Q. Now, if there should be a lull in building and comparatively less demand for labor, how could you enforce the demands of your affiliation?—A. Well, we have been through that period, and it did not seem to affect us any.

Q. You certainly could not have been through that period with your organization since 1897?—A. I thought you meant organizations generally.

Q. I am speaking of an organization which has an affiliation like yours. I can understand how a trades union can weather hard times. They provide for these things, many of them. But I wanted to know whether that matter had come under your personal consideration, and what provision you were making for it?—A. There is no provision made thus far.

Q. Have you a general fund?—A. We have not.

Q. You have no defense fund or strike fund?—A. There is a general fund—a nominal fund of about eleven hundred and some odd dollars. Our organization is young and all this will come under the consideration of conventions as we proceed. When we first organized all the delegates were opposed to a general fund.

Q. So far as your experience goes, what is your own personal judgment as to the advisability of a fund, known by any name you please—strike fund, defense fund, or emergency fund—that could be drawn upon in dull times to meet any emergency that might arise?—A. I would not be in favor of it, because I believe that eventually we will have all the national building trades unions affiliated in a national building trades council.

Q. What is your idea of the relative number of men organized in trades unions and those unorganized?—A. I do not know as to numbers. I think the organized are yet in the minority.

Q. How much of a minority?—A. That is a hard question.

22 INDUSTRIAL COMMISSION;—MANUFACTURES AND BUSINESS.

Q. One in ten?—A. Not that much. We are organizing all over the country.

Q. Have you any idea personally as to the number of workmen in the United States?—A. I have not.

Q. Assuming it is 15,000,000, are there a million and a half organized workers?—A. I think fully.

Q. What provision will you make to prevent the recruiting of men from the ranks of unorganized labor to take your places when a difficulty occurs between you and your employers, unless you have some emergency fund, or something of the kind?—A. The majority of men in unorganized labor are beginning to comply with the request of organized labor to stay away.

Q. Then you rely upon the feeling in the minds of unorganized labor that it is dishonorable to take the place of a man on strike?—A. To a great extent.

Q. (By Mr. FARQUHAR.) And unsafe?—A. Both.

Q. (By Mr. LITCHMAN.) You mean unsafe, not in the way of violence?—A. No; not by any means.

Q. Your idea is that it is unsafe as to continuity of employment and not as to physical harm?—A. Certainly. There is no employer in the building line, speaking from the builder's standpoint, but prefers the union man to the nonunion man.

Q. But if the contractor is trying to reduce the wages of the union men, does he hesitate to use the nonunion man as an instrument to gain that end?—A. Some do. I have known of contractors that would not employ nonunion men—while they wait—when they had the chance—said they would not have them.

Q. It became simply a question of endurance then between the contractor and the union workmen?—A. Yes.

Q. But you do know of instances where the unorganized and nonunion workmen have been used as means of breaking down the strike?—A. Yes.

Q. (By Mr. FARQUHAR.) You mention three unions that have passed out of the jurisdiction of the Building Trades Council in Chicago. On any building where your men are employed and have this local working card, would they strike against these men going to work on that same building?—A. I doubt whether they would under the present circumstances. They are using policy.

Q. In one way your policy means a kind of a quiet boycott. You in a measure boycott a union that goes out of your association?—A. No; I have not so experienced it. We have had the carpenters out of the Building Trades Council in St. Louis, and we even aided them in their grievances.

Q. Which body of carpenters?—A. There is only one we recognize, the United Brotherhood of Carpenters and Joiners.

Q. If you were strong enough in your trades council to hold up the building in any other city, as apparently there has been a check to the whole building in Chicago, don't you think in the long run it would be disastrous both to your organization and trades unions?—A. No question about that.

Q. Do you know of any better provision than you have in calling your business agents together to arbitrate as soon as possible when you come to a trouble?—A. I have always been not only in favor of but an advocate of arbitration. But it is the contractor who is the obstacle in most cases that have come under my observation. We had a conference board established in St. Louis between the building trades council and the contractors, but it died a natural death. They insisted that we should make an agreement to work for none but members of their association, and we could not do that.

Q. What is your opinion of the arbitration board and agreements such as are had with employers' associations by the national bodies of machinists and molders, and largely of bricklayers, too?—A. I am in favor of it.

Q. Making these annual agreements in their own trade?—A. I am in favor of it, but I have another one that will be more lasting and will embrace all of the various industries. We now have the allied printing trades, which I have no doubt will be national before long. We have the metal trades, which have a convention here now and are forming a national organization. We have the building trades council. If all these interests combine to form agreements with the employers' associations of those industries I think we can reduce strikes to a great extent and lockouts can be abolished. It is really the principal object of the National Building Trades Council to come to such a point and establish that.

Q. Has not your organization forced the contractors to organize also?—A. No question about that.

Q. And in all your building trades, when the employers or contractors are organized as you are, wouldn't that tend to modify the demands the workmen would make as well as the demands the employer would make?—A. Yes; certainly.

Q. In other words, the stronger the employers are organized, would not that minimize many of the rights and privileges of the workmen themselves?—A. Well, hardly. I think it would have a tendency to enlarge the organization of workers—organize more. It has proved to be so.

Q. Don't you find, practically, that a great many of your difficulties are really what you may call the privileges of trade or the customs of trade, rather than simply hours and wages?—A. The hours and wages are the principal things.

Q. Have you not trouble with business agents going into concerns where there is building going on and injudiciously interfering?—A. That has never caused a strike. That has been trumped up in Chicago as the cause of the lockout, but it is not true.

Q. Does it not cause unfriendliness of the employer?—A. I presume so if that occurs, and it should.

Q. If you were a foreman on a building immediately under your employer's authority, and you found that interference, don't you think it would be apt to cause a good deal of unnecessary friction?—A. That is only in isolated cases. As a general thing the business agent does not interfere. I speak as an old business agent.

Q. You think the business agent really a positive benefit to the union?—A. Undoubtedly so, the same as a business manager is to a business concern.

Q. Take your own trade; what are your duties as a business agent toward the union and toward the work in hand and the men that are doing the work?—A. My duties as a business agent were, in the first place, to see that men were in possession of their cards or had paid their dues; collect dues, where I could; to bring nonunion men into the fold of unionism, and in case of trouble to adjust it if possible by peaceable means. When a business agent of the painters I succeeded—when I was secretary and the only business agent at that time of the building trades council; in those 2 years we had two or three strikes, and we won them. One was at the city hall, where I was enjoined and everyone else was enjoined. The other was the Holland building, and the other was the Auditorium; and those are the only strikes we had, and they were won. Everything else was adjusted peaceably.

Q. You spoke of failures at Memphis and Savannah and other points. Were the extreme demands made on the part of the local building trades council what brought about the trouble?—A. Not exactly extreme, but the demands were made too soon. As soon as they were organized they made demands.

Q. Where you are making a change of wages or time do you give the contractors sufficient time usually to get the contracts in shape?—A. Yes.

Q. Is that one of your standing rules?—A. That is one of the rules.

Q. Would you discipline any organization below you in your council if it did not do that?—A. We would discipline any union that refused to obey the mandates of the council. One of the rules is that any change, demand, or agreement shall be read at the building trades council four times before it will be indorsed, and if it is not indorsed, why, of course it does not get the assistance of the building trades council. The balance of the trades will not be bound to aid in case of a strike.

Q. Do you find much difficulty with these unions lately organized, that are not very well up in the work of trades unionism?—A. Not since we have had the building trades council. They soon learn to adapt themselves to circumstances.

Q. Do you think that the council itself is a means of conserving the interests of the weaker, as well as the stronger, in that way?—A. Yes; in fact they are protected. The way the trades are represented in the building trades councils is so many to each trade. That has only been changed in the larger councils by seeming injustice. The carpenters, for instance, were paying a per capita on 1,700 men, while perhaps the elevator constructors, with only 80 men, were paying 30 men's per capita for the same representation. But to my mind the building trades council is a body composed of trades, each trade, as it were, becoming an individual, and hence I think that should cut no figure. While the carpenters pay that much more per capita, so many more men receive the benefit of the building trades council.

There is one thing I would like to state regarding agreements. The most trouble that we experience is on account of the agreements with contractors, and there is a tendency now of the unions becoming opposed to agreements. The contractors invariably insist that in the agreement there shall be a provision that no member of the union shall work for any one except a member of the contractors' association.

Q. Is not that very much like your own organization, that none but members of your own union shall work?—A. That is different. We are organized to make

sufficient to live, while they are in business to make profits, and this very agreement, by a combination of material men and contractors, becomes a most dangerous trust. They will squeeze the public, and it has been proved; and it does not do the workingman any good. Furthermore, the contractors' association invariably is comparatively small. They haven't got all of the contractors in their body. They can not guarantee work to the laboring man, and as long as he gets the wages and the hours he should be entitled to work wherever the hours are given and the wages paid. We have, for instance, breweries, hotels, and large establishments, that of necessity have to keep a force of men. Now, these contractors want us to go to work and refuse men to these establishments and compel them to give the work to a contractor. Now, we ask nothing of that sort. We care not whether a man is a contractor or not. The journeyman, after all, is the man who does the erecting of buildings. In a great many cases the contractor is not even a mechanic. Some go into the business that do not know a thing about mechanical work and the journeymen has to do it, so we care not whether a man is a contractor or not, we work for him so long as he pays wages and gives us union conditions. That is the basis upon which I believe the council will hereafter be governed.

Q. You spoke of the collusion of the furnishers of material with the contractors. Have you any rule at all about, for instance, putting in the walls of buildings stone out of a nonunion quarry and worked by nonunion men? Will you handle a nonunion product in your building?—A. That is left to local conditions, local councils. They have the say as to that. It is left to the national unions also.

Q. (By Mr. PHILLIPS.) Do you enter into written contracts with contractors to work only for them?—A. Some unions have. In St. Louis, for instance, the bricklayers have an agreement, and it is now doing injustice to other trade unions and fair contractors.

Q. Then it would be impossible for persons to get labor to do repairing outside, in the breweries, hotels, and in such matters you spoke of? There might not be enough nonunion people to do it?—A. There will be men that see the injustice of such an agreement and leave the union; that is, they would go to work and would be fired out of the union for doing the work.

Q. (By Mr. FARQUHAR.) Then what do they depend on, their working card?—A. No; they have not got the working card. Now, we have a case in St. Louis to-day, and it is causing considerable trouble to a contractor who has for years, and his father before him, been a friend to the union man, paid the highest wages always, and acceded to their demands if they were halfway just. He is a recognized friend of union labor. He is a stone mason contractor, does general building. For some reason the Master Bricklayers' Association made a law that none but practical bricklayers shall be members of that association. Now, this man employs a great many bricklayers; always hired union men. For the reason that this agreement has been made, and the building trades council indorsed that agreement, this man is deprived of union labor. The council knows the injustice of it, yet can't help itself, as it must stand by the agreement it has indorsed; but I do not believe any agreement embodying any such provision will ever be indorsed again.

Q. Possibly you needed that as an example?—A. Yes, indeed.

Q. Is it a fact that many in the contractors' body in the Chicago strike are the strongest union men that ever were in the city of Chicago—paid out more union wages?—A. I think so.

Q. What do you think about a settlement in Chicago? Do you see any way out of the tie-up that they have there?—A. I do not know, except the contractors retract their stubborn hostility toward the building trades council. I think it will be continual trouble. The convention of the national building trades council may take a hand. I am in hopes that eventually a system can be brought about between the National Association of Building Contractors and the national building trades council. It has been my idea for some time, until the contractors of Chicago have shown such a terrible antipathy to building trades. I do not know whether it will ever be accomplished, but I think it will eventually come to that.

Q. (By Mr. CLARKE.) Don't you think that the contractors of Chicago object more to the inefficiency of the building trades council to determine matters that are submitted to it than they do to organization or to the existence of a council?—A. Well, hardly. I believe that they think that the council was too powerful in enforcing conditions. For that reason they wanted to abolish it.

Q. Are you not aware that the council has not attempted to settle the difficulty?—A. The council has offered arbitration and the contractors refused. The mayor interposed and offered arbitration and the contractors refused.

Q. When a union there has practically agreed with the contractors for arbitration or some other settlement, and that has been submitted to the building trades council, do you not know that the building trades council has not acted upon that itself, but has submitted the proposition to a referendum of 55,000 men, which takes a great while?—A. There is no question that matters have been handled rather carelessly and recklessly.

Q. Don't you think that if that building trades council were organized as yours is in St. Louis, with capacity to legislate and quickly determine the matter, that the contractors would not object to it?—A. I do not think so. In fact, this matter was a long time considered. There was an attempt on the part of the contractors to abolish that building trades council, to kill it. The contractors abrogated the agreement which they made with the council in the first place—that is, for the Saturday half-holiday. That was made the parent cause of the lockout. This agreement they had signed in good faith, so the Council thought; but they simply told the men to come back to work at 1 o'clock, and when they did not come back they locked them out. The wrong has been from the very beginning on the side of the contractors. I admit that irregularities have happened on the side of the building trades council, but the contractors are entirely at fault. In my report last year to the convention I alluded to the lockout—that it was all out and dried. They had even asked for the National Contractors' Association to aid them, which was in the course of formation. I know I alluded to it in this report here. It says: [Reading.] "While I am confident that no organization of contractors will ever so far forget the duty incumbent on American citizenship and humanity as to attempt to starve men into absolute subjection to their own will and pleasure by a wholesale lockout of building tradesmen, it is equally certain that the above-quoted section," and so on. So I say we knew all about it then, that there was going to be a lockout or an attempt was to be made to lock out.

Q. (By Mr. FARQUHAR.) Do you think that this Chicago strike or lockout, having lasted as long as it has, is going to in time be of some injury to your organizing councils all over, and that if you should have a repetition of it, it would be disastrous to your organization?—A. No; I do not think so. In fact, it acts as a warning to other councils to organize properly in carrying on their work.

Q. (By Mr. PHILLIPS.) Have you anything further you desire to read from your report of last year?—A. There is another mention of the same subject further on, which reads:

[Reading.] "Never has the necessity, the usefulness, and benefit of a national or international federation of building trades been so plainly demonstrated than to-day, when contractors in various cities, aroused to the realization that the journeymen everywhere, encouraged by the very existence of our grand federation, have determined to henceforth have a voice in the distribution of the wealth they create—that they propose and are in condition at last to handle intelligently those economic questions that are of special interest to them.

"While the short-sighted bluff attempted by some of the contractors of Chicago and elsewhere to starve the journeymen into submission of modern slavery by a general lockout caused but little worry to the building trades councils, it nevertheless created a stir and responsive chord among a class of contractors all over the country, and a convention has been called of the National Contractors' Association to meet in Washington next month.

"I do not believe that there is any great danger that the threatened lockout will ever materialize." (That was then my own belief.) "Contractors who have investigated the workings of our organization could not help but be convinced that a 'lockout' inaugurated by the contractors would most likely return home and be very apt to force the contractor—considered by many a convenient but dispensable adjunct in the building industry—out of existence.

"Let us hope that their convention called for next month will follow the example of the National Building Trades Council of America at the last convention in Kansas City, and recommend and cause the formation between contractors' associations and building trades councils of conference boards, with a view to removing the cause of strikes, and establish a more friendly feeling between contractor and journeyman, and of security and encouragement to investors and builders."

Q. (By Mr. FARQUHAR.) You spoke of the St. Louis Exposition. Are there any contracts out yet for your exposition?—A. No; there is nobody yet in authority to take contracts.

Q. Is it the intention of your body there to have nothing but union labor on the exposition, the same as Buffalo?—A. Certainly.

Q. The same as the Pan-American Exposition in Buffalo?—A. Certainly.

Q. I observe that the Buffalo Trades Council is not in your national body.—A. No. As I said, a great many are not in, but they have a responsive chord, and they have not voted whether they will affiliate or not, and, of course, if there is a majority of one against it, it will not affiliate.

Q. (By Mr. CLARKE.) Mr. Brennock, a leading witness for the Building Trades Council in Chicago, testified before the subcommission of this commission which investigated this Chicago difficulty, that the solution of that trouble, in his opinion, was the abolition of contractors themselves. In your opinion is that practicable or desirable?—A. That is a hard question to answer. As I said before, the journeyman after all is the man that does the building, that erects the building. The contractors, especially large contractors, pay out the money, take care of the pay roll, and that is about all. They have their superintendents. Everything that is done on a building is done by the journeyman. The only way that can be brought about what my brother Brennock said is by repetition of lockouts. Then the National Building Trades Council, which is growing daily, will certainly make provision to have sufficient funds on hand to go to the place where the lockout is and take hold of the work. I advocated that in Chicago. Had they followed my advice, I do not believe the Chicago Building Trades Council would have lost. Some laws would have to be made to make it work more rationally.

Q. If there were to be no contractors, who would supply the apparatus and material?—A. Oh, well, where there is a will there is a way. In 1887 the painters were on a strike for an increase of 10 cents a day, and it was fought bitterly. We had then the local organization of the Journeymen Painters' Union in Missouri. I was its president. They went to the employers day after day trying to get them to accede to our wishes. They refused to do it, and I advocated this: We had several thousand dollars standing in the treasury; the people wanted their work done, were anxious to have it done; a reign of terror was in St. Louis at the time, and I told them as citizens that we ought to go to work and change the conditions and clear it up by establishing offices and shops in every section of the city, and run it as a cooperative painting company until our employers would come to time. We had at that time too many of the foremen on the arbitration board, who were the executive board in the matter, and while it passed the mass meeting, this executive board laid it on the table. It was not acted upon. The next day they went back to work. But the consequence was that my language had been conveyed to my employers, and I could not get a job in St. Louis in the painting trade, and in a jocular way they asked me what was the matter with my cooperative company. I started one and I kept it for 5 years; and I hadn't a cent back of me, and my family was almost starving at the time, but I have got a pretty good front and I got ladders and rigging all right, etc., on time, and started to work. Now we are in a different position. We have now four national organizations affiliated who will have capital for a strike fund. We are getting more councils every week. They are coming into the National Building Trades Council, and I do not think it would take much to create funds sufficient to start almost any business.

Q. (By Mr. CLARKE.) Your idea is then that several unions could own all the necessary apparatus for carrying on a business in that trade?—A. That is a possibility. I do not say it ever will happen, but I say if such lockouts as in Chicago become frequent, some such thing certainly will happen, and I am satisfied if that is ever undertaken that there will be plenty of capital coming in from private parties to carry it on. I have now in my possession at home a letter from parties in Iowa who are willing to put up \$150,000 if I start a cooperative company in St. Louis.

Q. If the business then were to be undertaken by the separate unions, would all unions of one particular trade make a contract with the owner of a building for the erection of the whole building and then sublet to other unions?—A. Of course, as to how and wherefore, that is a matter of consideration. We have never thought of that, but I should judge that the executive board of the National Building Trades Council would take hold of the matter, perhaps, by forming an association for that purpose under the jurisdiction of the National Building Trades Council and its affiliated organizations.

Q. (By Mr. PHILLIPS.) How, in that case, could you take care of the unemployed who belong to your unions, if you had not sufficient work? Would they not seek employment some place else if you could not give it to them under this cooperative plan?—A. I presume so; but I am speaking of the lockout, when all would be locked out. Now the way we got around that in our last strike of painters in St. Louis, where we got an increase of 50 cents a day, they allowed every man to go to work for every employer that signed the scale that was willing to pay the wages, and those men, as fast as they were employed, paid 20 per

cent of their earnings to a fund to support those not at work, and of course we gained the increase of wages—50 cents.

Q. (By Mr. CLAKE.) If private contractors were to be dispensed with, the unions would have to be contractors, would they not?—A. I think it would perhaps come back to old time day work, which is preferable to contract. These contracts are to an extent a phase of gambling after all.

Q. If it came to that, then a man who wishes to erect a building would have to make contracts with the individuals who are at work on that building, would he not?—A. Before contracts were really in force or inaugurated, an employer would do the work and charge so much for his employees. In the painting line, for instance, he would charge \$4 a day.

Q. Is it practicable in modern building operations to dispense with contractors?—A. No, it is not on large buildings. I am speaking of this in case it would come to such a thing. I do not know what the result would be—the ultimate result—but it certainly will be tried. There is no question about that, because it has been talked about.

Q. That will only be introducing a new form of competition?—A. Possibly so.

Q. What is your idea of a sympathetic strike?—A. They are a necessity.

Q. Would you extend it beyond affiliated trades?—A. If it is a case where humanity demands it, yes. Such, for instance, as the miners or men that are underpaid and working under conditions bordering on slavery. Every time.

Q. The question of humanity enters into almost every strike, does it not?—A. Yes.

Q. Do you believe in the boycott?—A. I believe that if a man appears inimical to me or my family that I certainly ought to resent it and leave him alone also. That is, in other words, I believe in not patronizing my enemy and making him richer.

Q. Take the case of the Cleveland street car strike, with which I presume you are familiar. The strikers undertook to boycott the whole public who would ride in the cars of the company.—A. Anything can be overdone. I do not believe in injuring the public or the public welfare. In other words, I do not believe in carrying it out to an extent where innocent parties are injured.

Q. (By Mr. A. L. HARRIS.) As I understand, of course, the National Building Trades Council favors arbitration?—A. Yes, based on that very thing.

Q. And the local building trades councils also, as a rule, favor arbitration?—A. Yes.

Q. And the different trades composing the different local councils favor arbitration?—A. Yes.

Q. Does not the introduction of the building trades council, as to-day proposed in Chicago at least, complicate and to some extent interfere with the reaching of agreements between the contractors and the different trades engaged in the construction of a building?—A. That is not the fault of the building trades council. It is the fault of the contractors, who refuse to arbitrate direct with the building trades council.

Q. Was there not an agreement entered into last winter between the Building Trades Council of Chicago and the Building Contractors' Council of Chicago to come together and agree upon some terms for arbitration, and did they not agree upon a general principle by which they could arbitrate and get clear of their troubles, and was not that promptly indorsed by the Building Contractors' Council and not indorsed by the building trades council?—A. That I can not tell; I do not know.

Q. You have no knowledge?—A. I have no knowledge.

Q. That was so testified and admitted on both sides. What I desired to get at was this—whether the present attitude of the building trades council in a city like Chicago, where all of the trades that enter into the construction of a building are brought into one body, does not really stand in the way of arbitration on account of the complex conditions existing there?—A. I can not possibly understand it that way, inasmuch as it certainly should be easier to arbitrate a difference by all being united than to arbitrate by the various different branches.

Q. As I understand, when they undertook to reach a plan by which their troubles could be adjusted by arbitration, the different trades comprising the building trades council objected, for the reason that unless a representative of the trade could be named in that board of arbitration they would oppose arbitration, because the technicalities of their trade would not be understood possibly by the board of arbitration—the technicalities of 84 trades—but the technicalities particularly of the trade that was then having the dispute with the contractors?—A. I do not believe that is unjust. I think that was just. That trade should be thoroughly represented. If there are such technicalities in that trade which are not liable to

28 INDUSTRIAL COMMISSION;—MANUFACTURES AND BUSINESS.

be understood by an outsider, then certainly there should be representation there, because the whole arbitration might devolve upon that very question.

Q. The building trades council being composed of 34 trades, and the building contractors' council having a representation of, say 5, it would hardly be fair for the building contractors' council of 5 to undertake to make an agreement with 34 representatives, because they would be outvoted?—A. No.

Q. Now, is there a possibility of having a board, say composed of 5, or any limited number on each side, that could adjust the differences such as they have in Chicago at the present time?—A. I should think so, if the willingness of both parties could be brought about.

Q. Would there be an objection on the part of the National Building Trades Council at least to authorizing a board of arbitration that did not take in members of all the different trades?—A. The National Building Trades Council has no hand in it at all, has never been consulted. The National Building Trades Council believes that it could have adjusted this matter had it been consulted at all; but we have no right to interfere with the autonomy of the local building trades council, except it is in violation of one of the laws of the National Building Trades Council.

Q. In perfecting your organization, would it not be well to give the executive board more power in arbitration?—A. Yes; I shall take that up in this coming convention.

Q. How is the general executive board controlled now?—A. By trades. There are 6 general vice-presidents, 1 general president, and 1 secretary-treasurer, which makes 8. That is the general executive board.

Q. That general executive board would be in sympathy with a condition such as in Chicago, and if they had to be consulted before such a condition was inaugurated, and had some power to control, would it not greatly relieve the situation as it exists there now?—A. Yes. It must be understood that the law was really insufficient until at the last convention the executive board was made a board of arbitration, providing a council would ask for it, and the executive board was granted authority to levy an assessment in case of a strike or boycott. It was the first time it was introduced last year, and the Chicago lockout came immediately after, so hence we learned a great deal. I believe that a law will be made that no building trades council or union will receive a benefit until it has thoroughly used every other means to adjust the matter, and it is reported to the general executive board, and then the general executive board takes charge and tries to adjust it.

Q. The experience that you have had this last year lightens your way to some extent as to the future?—A. Yes, indeed.

Q. Do you hope that in time your National Building Trades Council will be able at least in an indirect way to have some control over building trade conditions?—A. In cases of strikes and lockouts, yes. In fact we are working to that end.

Q. You concede, of course, that the building contractors' council is composed of men who are fairly reasonable?—A. Some reasonable and some very unreasonable, like all other bodies of men.

Q. And it certainly is to the interest of a city like Chicago to be able to adjust conditions such as exist there, and that being the case, this condition likely to fall upon any city at any time where the two organizations exist, it is highly important that some way be laid out by which troubles of this kind could be adjusted or prevented?—A. Yes.

Q. You have a hope that they may be?—A. Yes, and shall work to that end as far as my little influence might go.

Q. Can you not see that present conditions in Chicago are somewhat complicated on account of 34 different trades being in the attitude of sympathetic strikers whenever one has trouble with contractors?—A. Yes.

Q. For instance, the plumber, the importance of whose trade may be in one respect the least of all, has a little trouble, and all go on a strike. On account of that trouble the building is at a standstill?—A. The sympathetic strike will never be done away with, because it is the very foundation principle of the building trades council. There is a law—I think it is the same in Chicago as St. Louis; but whether they carried it out or not, I do not know—that no strike can be declared on any building in St. Louis except two-thirds of the trades interested are in favor of that strike.

Q. That was testified to in Chicago by the members of unions of different trades, but it was also testified to on the part of the contractors that every man would frequently lay down his tools and go out of the building when there was certainly not time to submit it to the different trades.—A. Well, they did that perhaps as individuals.

Q. The contractors complain that frequently the rule was changed on them while the building was in course of construction, and a demand was made that they could not accede to during the construction of that building, and that trade, of course, had a grievance; it would strike and the others would all follow.—A. It seems to me that the contractors are at fault in not being sufficiently conservative to try and adjust matters before they come to a lockout.

Q. From their side they did everything they could.—A. But they went to work and violated every agreement they made with the men. They attached that as an excuse, something to begin on. They refused to abide by the half holiday.

Q. Do you not think it failed on both sides at Chicago?—A. No doubt; they certainly had some idea that the national council had some influence. Had they consulted it, although the building trades council would not have asked for it, we would have made an attempt to adjust it and something would have been brought about.

Q. Which organization was on the ground first in Chicago, the building trades council or the building contractors' council?—A. I think the building trades council.

Q. And the building contractors' council was thought to be a necessity on the part of the contractors to offset the building trades council, is that it?—A. Partly, perhaps, but the way I understand from the contractors in St. Louis, they favored the building trades council and copied after it naturally for the same purpose, to keep prices, so they say.

Q. (By Mr. FARQUHAR.) Do you believe in the so-called compulsory arbitration?—A. I am in favor of any system that will effectively abolish the strike and lockout and yet give justice to the wage earner.

Q. Suppose that they had a body in Illinois with the powers of compulsory arbitration, as they have in New Zealand, and which has been talked about largely by workmen, how soon do you think it would settle the Chicago strike?—A. I really do not know whether that would settle it.

Q. The courts would carry it out, would they not?—A. Would that be constitutional? It seems to me that there would have to be first an arrangement made by which we would have a basis to work arbitration on—like agreements such as I believe are provided for in the New Zealand law. I believe that the matter could be accomplished. Now we have in St. Louis, for instance, a manufacturers' association; we have a business men's league—mercantile association; we have a building contractors' association. Those three central bodies of employers constitute nearly all industries. On the other hand we have the building trades council; we have the central trades and labor union; we have the union label league, which takes in all the organizations that are manufacturing. Nearly all have a label now. If a committee, a board of arbitration, or a court of arbitration were elected or appointed from these organizations, and take the State labor commissioner as the seventh, I think great good would be accomplished.

Q. You have a State board of arbitration in Missouri?—A. We have a labor commissioner.

Q. That is all?—A. That is all. The labor commissioner of Missouri, in 1896, sent to several officials of labor unions a request to give their views as to what should be his work. I will read part of my reply. [Reading:]

“SECRETARY'S OFFICE,
“BUILDING TRADES COUNCIL,

— “218 North Eighth Street, St. Louis, Mo., January 8, 1896.”

“HON. LEE MERIWETHER,

“Commissioner of Labor Statistics and Inspection.

“DEAR SIR:

* * * * *

“To me it really seems a difficult matter to suggest to your bureau the subjects that to my mind most urgently need to be investigated, for the reason that if such investigation be for the benefit of labor and the abatement of existing evils it would be necessary to invoke and enforce the laws governing the questions and wrongs under inquiry, which, in the absence of such efficient laws, to judge from past and recent experience, would be of little or no benefit to labor.

* * * * *

“Labor organizations have passed the stage of experiment and are an established factor to-day. They are progressive in character and learning fast. The innocent (?) deceptions practiced in former years by the proverbial ‘friend of labor’ in foisting laws upon us that could not be enforced won’t go. They are no longer satisfied with any condition of society that does not give to all the comforts of home, the privilege of a thorough education, and a reduction of the hours

30 INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

of labor in proportion with the machinery produced by inventive genius. That powerful enemy to free labor and free government, the trust, which caused the destruction of Rome, is becoming more and more rampant in this country, and will stop at nothing to force labor to the wall by the enactment of such laws as foster millionaires only. Yet this is a government of the whole people. 'The right of the rulers and lawmakers should be drawn from the consent of the governed,' and no country can be successful and prosperous that allows the great majority of people who create the wealth to suffer want, while the few own and control wealth, industry, and the Government.

"The first and paramount duty, therefore, of those who are placed by the people in position to govern by the introduction and enforcement of laws should be the enactment of such law as will enable those who earn their bread and clothing not only to eat and wear them, but in addition to realize the fundamental principles of this country, 'the inalienable rights of man: life, liberty, and the pursuit of happiness.'

"The conditions in this country, under its present social system, have undergone a remarkable change since its inauguration. The powerful combinations of soulless capital were then unknown and not dreamed of. To-day we are confronted with the dominant power of centralized capital that greedily grasps control of everything in sight, even the Government. The phenomenal evolution of science in our age of progress, with its multitude of labor-saving inventions, all these conditions point to the impracticable features of a law then established, or copied, and still in vogue, and demand the framing and enactment of new, common-sense, 'American laws' to meet the exigencies of to-day, as imperatively necessary.

"If we honestly desire the perpetuity of our republic we must take from the neck of free labor the heavy foot of combined capital; its giant fingers from the throat of free agriculture, and allow the lifeblood of this country its free circulation through the various arteries of honest industry, and take Thomas Jefferson's word for it—'The people and not the rich are our dependence for continual freedom.'

"Seventh, the introduction of that part of your official duties pertaining to arbitration and contained in article 2, chapter 95, Revised Statutes, which, like all labor laws, lacking efficiency, may in many cases have a tendency to avoid strikes, and will be a means to prove to the public that in nearly if not all cases corporations and employers are responsible for that destructive and unprofitable (but to labor, sometimes, in lieu of just and efficient laws, necessary) evil. In all of these investigations all labor organizations can and should and gladly will give you all necessary aid.

"Respectfully yours,

"H. W. STEINBISS,

"Secretary Building Trades Council and
"President Journeymen Painters of Missouri."

That was my position in 1896, and, as far as it bears on arbitration and other matters, that is my position to-day.

Q. (By Mr. A. L. HARRIS.) I see you have trusts in that as far back as 1896?—A. Yes, I foresaw them.

Q. (By Mr. FARQUHAR.) Have these trusts really been injurious to the working men?—A. Certainly.

Q. And the skilled mechanics of this country?—A. To all; if they are injurious to one they must be necessarily injurious to all. They concentrate their labor, they minimize the expense, and do everything to get everything out in the cheapest possible way to bring the most results and fortune to themselves.

Q. Do you know of any so-called trust in this country that has not raised the wages of its men in the last 2 years?—A. I only read the papers; I cannot mention particular ones.

Q. Do you know of any of those trades where there are not more men working now, and at better wages, than 2 years ago?—A. The times alone bring that along, and it is not the endeavor of the trust or the corporation, where the stockholders are unacquainted with the workmen, but leave it to hired men to do their bidding, who must enforce the rules that are given to them.

Q. Do not the trusts employ more union men now than the same trades did before?—A. I think so.

Q. Are you aware that nearly every so-called trust in America declares that none but union men are working for it?—A. I do not know about the tobacco—

Q. (Interrupting.) I am speaking of the skilled trades.—A. That is done for the reason that they are the best mechanics, and they get more work out of them and better work.

Q. (By Mr. PHILLIPS.) You alluded to good times having something to do with it. Are there any more employed now than there were in 1890 and 1891?—A. As a general thing, yes.

Q. Was the proportion about the same for the workingmen before the panic as it is now?—A. Before the panic, yes.

Q. (By Mr. FARQUHAR.) As capital combines for the accomplishment of greater objects, like our foreign trade and everything of that kind, where would your argument for your building trades council stand if you condemned these combinations? You are looking for the same thing they are—strength, force, and fair play—are you not?—A. No; I do not think so. I believe that they are looking mainly and principally upon profit.

Q. The greater productivity they have brought about in this country will certainly lessen prices, will it not?—A. Yes; but I do not believe they are productive of better wages.

Q. Are you not aware that they pay larger wages?—A. No; not to my knowledge. In some cases perhaps they do, because they must employ organized labor. They can not afford to have a fight on their hands, and, of course, they have to pay union wages.

Q. Are you aware, as a trade unionist, that these combinations have unionized labor in this country more than ever?—A. No; I do not think so.

Q. Do you know any of the combinations that employ nonunion labor?—A. The tobacco trust.

Q. I am talking about skilled labor.—A. They are union—a strong union, too.

Q. (By Mr. PHILLIPS.) Right on that question, do you believe that this large combination of capital tends to centralization and tends to make a working class and a capitalistic class?—A. It will bring that about, if there is not such a class now in existence.

Q. (By Mr. A. L. HARRIS.) You recognize the fact that fortunes are distributed in every generation?—A. Yes.

Q. I want to ask this question, whether organized labor is not looked upon by many people as a trust?—A. By some, yes. It is a trust, really.

Q. And legislatures in passing trust laws have excepted organized labor because the law would probably take them in as a trust?—A. Because it is a beneficial trust; it endeavors to elevate mankind, while the other simply is for profit and is injuring industry. For instance, since the sugar trust was established, we have lost a great many sugar refineries that employed thousands and thousands of men before.

Q. (By Mr. FARQUHAR.) You are refining more sugar than you ever did before, after you abolish a few of them, are you not?—A. Yes, that is so.

Q. Were not these sugar refineries built to sell just as oil refineries were built to sell?—A. Undoubtedly. We believe they would have been going on and men would be employed there if it had not been for the combination of these various sugar refining companies. I believe that there are a great many people in the United States to-day in our present prosperous season who are unable to have sugar on the table. I am positive of it.

Q. (By Mr. HARRIS.) In what locality?—A. In most all localities. What applies to sugar applies to other matters to a certain extent.

Q. (By Mr. PHILLIPS.) Was not the great development made in this country under corporate law by companies before the trusts came into power at all? Have they created anything? Have they not rather utilized these great combines to reap a profit for themselves and put prices up upon the public? Was not the development made without them?—A. I look upon it in that way. That has been my very argument in relation to agreements where the contractors have been trying to establish a trust.

Q. (By Mr. CLARKE.) Did you have anything to do with the street-car strike in St. Louis in the way of trying to bring about arbitration?—A. Yes; I have been in company with the presidents and secretaries of St. Louis when they were called upon in meetings to try arbitration, but the company refused to arbitrate.

Q. Was a definite offer of arbitration made by the strikers themselves?—A. Through their attorney, Governor Stone.

Q. And that offer was rejected by the railroad companies?—A. There was one offer that was accepted, but it was claimed afterwards that the answer was given too late; they got out of it that way.

Q. Did you or your organization personally make any proposition for arbitration in that matter?—A. The building trades council?

Q. Yes.—A. No.

32 INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

Q. You had no special part or lot in it yourself?—A. No; not officially; simply in an advisory capacity.

Q. Then your knowledge of it is substantially what any other citizen of St. Louis would possess?—A. Yes. On one of the controversies between the Suburban Railway Company and the employees' union I was one of the arbitrators.

Q. Selected by whom?—A. Selected by the union; and one was selected by the company, and the two selected another—three arbitrators.

Q. Did you hold a hearing?—A. Yes.

Q. You arbitrated the differences?—A. Yes.

Q. Made a report?—A. Yes.

Q. Was the report accepted and abided by?—A. Yes.

Q. It settled the difficulty, did it not?—A. Yes. The report was not satisfactory to me; I made a minority report. Yet the majority ruled and the union abided by the decision.

Q. There has been no trouble there since, has there?—A. No.

(Testimony closed.)

WASHINGTON, D. C., November 12, 1900.

TESTIMONY OF PROF. JOHN R. COMMONS.

Of the Bureau of Economic Research, New York City.

The commission met at 11.05 a. m., Vice-Chairman Phillips presiding. At that time Prof. John R. Commons, of New York City, was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. CLARKE.) You will please give your name.—A. John R. Commons.

Q. Post-office address?—A. 35 Lafayette Place, New York.

Q. Occupation or official connection?—A. I am a student and writer on economics and sociology, and have been teaching hitherto, but am not at present.

Q. What is the Bureau of Economic Research?—A. That is largely a hope, a prospect. Four or five persons like myself have joined together with the idea of taking up any line of economic or political research for which there seemed to be a demand in New York City, giving information, and making it of scientific character as nearly as we could, something reliable. We have been organized now about a year, but have not done very much yet. Each one has been working along his own line. It is not an incorporated body.

Q. Have you given special study to the subjects of industrial councils as advisory to legislation, and also to unemployment, public employment, day labor, contract labor, immigration, compulsory arbitration, etc.?—A. Yes, those subjects I have given attention to as a student. Also, in a way, I have had some practical experience, having been at one time for 3 years a member of a printers' trade union and holding a case, working at night on a daily paper in Cleveland, Ohio, which has given me some insight into the matter of labor and labor organization that has been of considerable advantage to me later in my studies; but I do not pretend to speak from the standpoint of one who is engaged in the practical work of labor at all—simply as a student.

Q. Please proceed in your own way to state to the commission such knowledge as you possess on these subjects and any opinions which you may have formed.—A. I think the subject of labor councils is one which is suggestive. I at different times have taken occasion to become acquainted with our State boards of charities and corrections and to notice the work which they have accomplished in the charitable and penal institutions of our States. I have no doubt you are all familiar with those boards. The State board of charities and corrections is something unique in this country, and the constitution of that board offers suggestions, I think, for similar boards in dealing with capital and labor. That is to say, it was found that the great difficulty in our State charities and penal institutions was the contest between the two political parties to get possession of those institutions; and we met that in this country by organizing a nonpartisan board, unsalaried, having an equal number of men on each side of the two parties and having no offices to distribute, no rewards to give. Consequently it was possible to get men in there who were interested more in the reform of the prisons and the charities than in their administration in the way of distributing the offices. As a result we can say, I think, that practically all of the progress that has been made in this country in improving the prisons and charities of our States has originated in these boards, the first one being organized in New York in 1863.

They work in this way: Being a permanent board, meeting say once a month for 2 or 3 days, they appoint a secretary who is a salaried official—practically the only office they have to give—and he is considered an expert on the question, becomes a leading authority in this country and other countries, and when the legislature meets—I have paid attention to this in the sessions especially in the Indiana legislature where I was acquainted with the commissioners—every matter of legislation that deals with State prisons or any charity or hospital is, of course, referred to that board; and they are on the ground there and can give their cooperation and assistance to the legislators who, of course, are not specially informed on the subject. In France and Belgium they have adopted practically the same thing for labor legislation; but instead of having two political parties equally represented, they have the capitalist and the laborer. In France the board is composed of 16 members elected by large associations of tradesmen, manufacturers' associations, national associations, syndicates, and 16 labor representatives elected by the labor organizations. Then the Government appoints another 16 experts. I came upon the practical operation of this labor council in France through investigating the subject of public employment.

Q. (By Mr. PHILLIPS.) It is called the higher council of labor?—A. Yes, the superior council of labor.

Q. It has 50 members?—A. Forty-eight members. I should say that originally for several years the council was appointed solely by the minister of the interior. Last year it was changed to an elective body, two thirds elected by the two interests and the other third still appointed by the minister of the interior. In the particular case that I have in mind the question of the prevailing rate of wages on public contracts was before the Parliament of France. The Parliament, it appears, referred it to this labor council, and the labor council called upon the bureau of labor statistics or the department of labor to furnish the council information as to the practice in other countries; and the report on that is the most complete report which we have on the subject up to that time, 1897.

Q. Do they have a similar council in Belgium?—A. The Belgian council was appointed about the same time as in France.

Q. In 1891?—A. Yes; about that time. The Austrian council is much later.

This council then took this material which was furnished by the department of labor, and they discussed that material with reference to forming some resolution which they could recommend to Parliament for adoption.

It has frequently appeared as a criticism against our department of labor—I remember one of the members here was speaking, not by way of criticism, but with reference to the desirability that the labor department might be of greater service to Congress, for example—that the department of labor did not take upon itself the duty of drawing conclusions from the voluminous material which it collects. It seems to me it would be out of the province of the Commissioner of Labor to draw conclusions. He does not represent anybody; he is not competent to suggest what kind of laws shall be enacted, because he is an administrative officer. The consequence, however, has been in our States that there is a struggle to always have a labor man as Commissioner, the idea being that he would influence labor legislation perhaps; but he does not do it, and very properly, because legislation ought not to be influenced by one interest where other interests do not have a voice.

This labor council, however, takes this material and has the Commissioner with them as one of their number, and they join together, and out of that they get some sort of a proposition which the two represented interests there can agree upon. As a matter of fact, in this case they recommended that in all public contracts a clause be inserted requiring that the prevailing rate of wages be paid. They did not go as far as the labor people wanted them to go, restricting the hours in all cases to 8.

Q. Do you allude now to France?—A. France. I am describing now in a concrete way the operations of this council. The discussions of the council occupied several days on that one proposition. It was presented to Parliament, and about a year afterwards Parliament adopted practically the recommendation of this representative body. It strikes me that there we have going on in France in the matter of labor what we are having in this country in the matter of charities and corrections—that is, expert assistance to legislation—and it is also representative of the interests affected; and I should consider that if we could have some sort of permanent body of that kind in the National Government and also in the States, it would be of assistance in the legislation and in administering labor laws.

Q. (By Mr. PHILLIPS.) The commissioner charged with about that duty.—A. This is a temporary body, but I have in mind something of a permanent character along the same lines.

In Austria they have two bodies—the bureau of labor statistics and the advisory council—at the same time, and the proposition which I have is quite similar to that; in fact, suggested by those three councils in Belgium, France, and Austria.

Q. (By Mr. CLARKE.) Your understanding, then, is that these European councils are largely governmental institutions; invite some cooperation from labor organizations, perhaps, but appointments are made by some government official?—A. That is true in Austria and Belgium and formerly in France. The law as amended last year reconstructs the French council in this respect, that 32 of the 48 members are elected, 16 of them by organizations of manufacturers and capitalists already in existence, like the bankers' associations; chambers of commerce, and the national board of trade, and the other 16 are elected directly by labor unions, which have been grouped into 16 groups for their purpose, each electing 1. That is the only amendment—that is the latest in their organization.

Q. Are the members compensated?—A. The labor members are compensated on a per diem basis, and I think the capitalist members are entitled to the same, but do not draw it in some cases. I am not positive about that. It is not expected there that they shall give all of their time to it; in fact, they only meet occasionally. Sixteen, one-third of their body, is a permanent body of men appointed by the Government; the other two-thirds are elected by the two interests, so that they compose the two bodies, or a salaried body and a strictly representative body elected annually.

Q. Have you ever attended a meeting of any of these councils?—A. No; I never have.

Q. Do you know whether or not the various elements work in harmony?—A. I have gone through the debates on this particular subject which I mentioned, and there was considerable difference of opinion; but as it finally came out on this particular measure the report was a unanimous one. So that I judge that they endeavor to conciliate as much as possible and agree on something rather than make minority reports. I have no knowledge except on that one measure.

Another subject to which I have given some attention is that of unemployment. I consider that as the most serious of all our industrial problems. It is the one which goes to the root of all other social problems. The most important thing for the workingman, I consider, is a chance to look out into the future and base his expenditures on a secure employment. If we can not get the American workmen into the habit of thrift, it is doubtful if we can make good citizens out of them. Now, it ought to be designed for old age; but if a man is compelled to use up his substance for a period of unemployment over which he has no control himself, then it breaks down his character. We have not a very definite amount of information on that subject in this country. While unemployment is a serious problem, it is at the same time the most general, in this respect, that if we should get every other social problem solved we would then be able to solve the problem of unemployment. I do not believe we can mention a single industrial or social subject which does not have some bearing on unemployment, and I think I can show that very plainly.

In the first place, it is necessary to divide the unemployed into different classes. We can not treat the subject as a whole, and I think the best division would be to divide them into four classes, as follows: First, the able bodied who are willing to work; secondly, the able bodied who are unwilling to work; thirdly, the totally incapable; and, fourthly, those who are partially capable. And the treatment for these different classes should be different, and the different experiments which I shall mention in different parts of the world are based on this classification, as you will see.

EXPLANATION OF CHART.

[Producing chart.] I was speaking of the lack of exact information on the subject, statistical information. I have drawn here a chart representing two things with reference to Great Britain. We have no data for a similar comparison in this country. The broken line represents the movement of wholesale prices of commodities, by months, from 1883 down to September, 1900. You will notice that with every period of prosperity there is a rise of prices, and with a period of depression there is a fall of prices from the lowest point in 1887. You see prices reaching a high point in 1889, and then there was a break in 1891 with the Baring failure; then in the summer of 1893 the serious panic and depression came on; and then, beginning in 1899, a period of prosperity is shown, the boom, the rise of prices.

Q. (By Mr. C. J. HARRIS.) You say this is England?—A. This is England. That is the average of 45 commodities, Mr. Saurbeck's index number of prices.

Q. Prices of staple articles?—A. Prices of staple articles—wheat, minerals, agricultural products, and manufactured products to a limited extent.

Q. (By Mr. CLARKE.) All this chart is based upon Fairbank's tables, is it?—A. This is all Fairbank's tables.

The other line, the solid line, represents the amount of unemployment by months in the trades unions of Great Britain, the reports being made to the British Board of Trade since that date 1887. The figures are given by the board of trade on the percentage basis, the per cent of the total number belonging to the unions who at that time were unemployed; and you will see that in the beginning a little over 10 per cent of the laborers were unemployed. As prices rose the percentage of unemployed fell until it was about 1½ per cent when prices had risen to the high point shown in December, 1889. Then, as prices fell, we again find an increase in the unemployment, the climax of the unemployment being in January, 1896. Then business seemed to greatly recover on a lower basis of prices, and the unemployment fell off and has been fairly steady at about 2½ to 3 per cent.

Q. You use prices here simply as a gauge of prosperity, then?—A. It is an index to prosperity in this respect, that it tells whether prices are rising or falling; it does not indicate the volume of business.

Q. The relation between unemployment and prices is merely nominal, then; but really the relation between unemployment and prosperity is designed to be shown in this chart?—A. Yes.

Mr. CLARKE. Consumption is one of the evidences of prosperity.

Mr. FARQUHAR. Most decidedly; it is the regulation of the whole market, and the only regulating force you have.

The WITNESS. In the way that the two go together the contrast is complete. I think in every month throughout they move in an opposite direction, unless there be one exception. The index of prices is the best index which we have devised yet to prosperity; that is, the formal index, the statistical index; and besides that, of course, there should be added an index of the volume of business, which is fully as important, but it has not been worked out by statisticians.

Q. It is possible, is it not, to make out a chart showing that and its relation to unemployment?—A. I should think it would be, and it ought to be done. We ought to have a statistical department here which would follow up this thing month by month. You can not get statistics for a remote period on unemployment in the past. It can only be done by organizing the unions and the collecting agencies for the present and the future, and then we could get the amount of unemployment in a general way, and also this index number of prices and the index of the volume of traffic. Taking the railway earnings, for example, and the amount of output of iron and steel, certain things which are recognized as indicative of prosperity, they could be combined in a way and we could have, then, three lines which would indicate the movement fairly well.

Q. (By Mr. PHILLIPS.) Then your point is that unemployment is the criterion of the depression, and that where there is full employment prices advance. Is that the point?—A. So far my point is that the two go together. I am not prepared to say which is cause and which is effect, but the two go together. That is as much as that would indicate.

Q. (By Mr. KENNEDY.) Would not most naturally the unemployment be the result of depression rather than otherwise?—A. Yes. Now, that brings up all the theories as to unemployment, and I think perhaps I could make myself clearer by going into some of these causes of unemployment and discussing them briefly.

Unemployment on account of the winter months is brought out by that chart. You will notice that in January of every year there is a rise of unemployment. If you follow that through, you will see it in every year—December, January, and February. If you notice, there is one year when in the winter months there is less unemployment than in the other months of that year, and that happens to be the time when in the same months the prices were at the highest, showing that even the unemployment of winter can be overcome by the extra prosperity at the time. The two things undoubtedly work together. If we have prosperity, the seasonal fall is not so great. Unemployment on account of seasons can hardly be called unemployment for this reason, that it is something stated and regular and a man can predict it and prepare for it. He can discount it in his wages. If he is a seasonal worker, and other conditions being equal, he can secure higher wages when he is working as an insurance against that unemployment which he is certain of. So that seasonal unemployment is not strictly a problem of unemployment. It is a problem rather of insurance, something of that kind. Unemployment proper is that which is owing to the fluctuations of business termed "prosperity" and "depression." That is the great problem.

Now as to the remedy. I shall speak of the theories, as to the causes, only so far as they apply to the remedy.

The first remedy, which I think has been discussed before this commission, is that of the trade-unionist, who says we can remedy unemployment by shortening

the hours of labor and thus make room for the unemployed. I believe that is the trade union remedy—the 8-hour day. That is based on the theory of underconsumption, viz, that the producers of commodities have not enough earnings to buy all they produce.

In the early days of this century Malthus placed as his remedy for unemployment the larger expenditure of the wealthy classes. He said that to give work it is necessary that the wealthy live luxuriously. I believe in our day we take the other position. Many different classes of writers take the opposite position, that to remedy unemployment we should have a greater consuming power on the part of the masses of the people rather than the rich.

The explanation of prices based on that principle is this, that the wealthy classes are the only ones that can invest in productive enterprises. The working people do not have enough money to save. They simply live from hand to mouth, consuming what they get, and are not able to purchase all they produce. The result is, the wealthy classes, having large incomes, invest in too many enterprises; that is, they add to the productive capacity more than the market will stand, and finally are producing more goods than there is a market for, and the collapse necessarily comes.

Apparently the remedy would be either for the wealthy classes to spend it in luxury instead of in mills and factories, or for the working people to get such high wages that they both absorb what would otherwise be the extraordinary profits, and thus they would use it in building their houses, consuming it rather than putting it into bank or investing it in new enterprises. Thus if the working classes could have a greater consuming power the multiplication of industries and overproduction would be impossible.

The trades-unionist comes with this proposition: He says we have to reduce the hours of labor in order to take up the unemployed. I very much question whether his remedy would succeed as regards the unemployed, for this reason—there are three or four possibilities. Suppose the hours of labor are reduced and production remains the same, as might be the case in some industries—I believe it is held in some industries a man can produce as much in 8 as in 10 hours—that would not afford any remedy for unemployment. On the other hand, suppose the hours are reduced to 8 and production is reduced in the same proportion, and wages are also reduced in the same proportion. That, plainly, would take up some of the unemployed, but it would not increase the consuming power, because there would be a larger number of laborers getting the same wages. The wage payments of the country would be the same, but be distributed among the larger number, and that would not help the matter. The only case in which it would succeed would be where the production is reduced and the hours reduced but wages remain the same. In that case the same quantity of production would have to be brought about by a larger number of laborers and the wage bill would be higher. But there is one thing overlooked which seems to me insurmountable. In the third alternative, if the wages remain the same and the hours are reduced it must increase the cost of production, and an increased cost of production means that purchasers will purchase a smaller quantity of the product—there will be less sales, and consequently the unemployment would not be remedied in that way.

In other words, I should say the argument for the 8-hour day is not to be based on the idea that it will lessen unemployment, but on other considerations entirely, such as the broad ground of American citizenship—that the American citizen ought to have more time for study, to exercise the rights of freedom, and so on.

Q. (By Mr. FARQUHAR.) In the New York statistics some generalizations have been made in respect to the shortening of hours of labor in the great trades. Is it not a fact that the New York statistics have shown that the shorter the hours of labor in a day more men have been employed in a given trade and more permanently than when working under the 10-hour system?—A. I do not have in mind those particular figures. The trouble in all such statistical studies is that you must take into consideration the general business conditions. If the change was made at a time when business was beginning to improve anyhow, it would be the improved conditions rather than the 8-hour day which steadied employment. The most complete study of the subject that I know of is in Australia, where they have introduced the 8-hour day, and yet they are troubled with unemployment even more than we are. It has not abolished unemployment.

The next proposition that is put forward I do not know that I need discuss—the question of unstable currency. That is one theory—sound currency and bimetallism. I will not take up your time with them. Then there is the question as to what influence tariff has. I suppose your commission is not taking testimony on those subjects. Those are general questions which affect industries as a whole, and there can be no permanent remedy for unemployment which does not involve

the stability of the currency and the tariff. I simply mention those large questions for the reason that in the detail remedies which I shall speak of I want to avoid the idea that I consider them as a specific, as a cure, but simply as a palliative, for meeting the exigencies as we find them.

A practical proposition which I want to present is this: That the public authorities which deal directly with unemployment must deal with those three classes that I mention—those who are able but unwilling, those who are incapable, and those who are partially capable. The modern industry has really increased the number of that class of people—the chronic unemployed.

I was talking with a gentleman the other day in New York. He has in his employ a lithographer, paying him \$25 a week. That is the union scale. The union does not permit anyone to work for less than \$25 a week. This man is growing old and can not do a day's work on that basis. He could earn \$18 a week and would be glad to accept \$18 a week, and the employer would keep him at that rate, but he is compelled to discharge him, and the man gets no work at all simply because of that union standard. Some unions remedy that by a special tribunal, which will decide in the case of the one man—take testimony as to whether he alone should be permitted to work at a lower wage without any subterfuge by which the scale itself might be broken.

Another provision is that on public employment, which limits the number of hours and fixes the minimum wage. It compels contractors on public employment to be more careful about the men they employ and to work them harder, and if a man does not come up to their standard he is discharged altogether. The general tendency is, owing to the speeding of machinery and the higher pressure of modern industry, to increase proportionately the number of partially incapable and incompetent workers.

Q. (By Mr. CLARKE.) You think, then, the effect of the minimum wage is to increase the number of unemployed?—A. Yes.

Q. On the ground of their not being quite up to the standard?—A. Not quite up to the standard.

Q. (By Mr. FARQUHAR.) Have not all the unions provided a remedy in piecework?—A. Piecework is all right.

Q. And grade entirely from the minimum wage scale down to the efficiency of the man?—A. Yes.

Q. (By Mr. KENNEDY.) When speaking of the partially or totally incapable, do you include those who may be said to be incapable as a result of vice, intemperance, and so on?—A. Yes; a man who is either physically, mentally, or morally weak is less able to hold a job than ever before, and of course in a period of depression he is the first discharged. He is the man likely to get into intemperate and vagrant habits, and that number is necessarily increasing, owing to the pressure of modern industry, which in this country is higher than in other countries. There is no other way out of it.

Q. Then that chart which you present, showing the unemployment of the English unions, and which shows that in a time of prosperity only a little more than 1½ per cent of the membership of the unions was unemployed, is very encouraging, is it not, showing there are not many who are incapable as a result of vice or physical deformity?—A. I should say in regard to that table, it includes only organized labor, which in England is only about 15 or 16 per cent of the total, and unemployment among the unorganized is in excess of that, and it is among the unorganized that these cases would be found. That is where the problem is. Booth's figures show as much as 30 per cent in East London, and I think he would figure that 10 per cent of the country at large are below the line of efficiency either morally, mentally, or physically as regards industry. The number is exceedingly large in England, and we do not know how large it is in this country.

Now, with reference to this body of persons that are below the level, they need to be dealt with on different standards, and I do not speak of it from my own information or opinion, but from the study of what is being done in different countries.

To begin with, I would like to speak of the labor-colony idea, and to show what we have done in this country on that line. You, of course, know about the labor colonies. The State of New York has established an epileptic colony near Rochester. I have never visited it, but I have interviewed the superintendent. Curiously it turns out that epilepsy is largely a disease of unemployment. There used to be various medical theories as to the cause of epilepsy. It was thought to be a germ that got into the backbone, or something of that kind; but they have a remedy there in this colony, where they work outdoors. They have a motto, and it is this: "Fits, no work; work, no fits." He has cured epilepsy there. He has

found the cure for epilepsy. They have a colony in Ohio along the same lines. In Ohio the superintendent of the institution for the feeble-minded some years ago said that if the State of Ohio would buy 1,000 acres of land and give him all the feeble-minded in the State he would make them self-supporting. The State of Ohio has recently given him the chance, has it not?

Mr. A. L. HARRIS. Yes.

The WITNESS. Do you know how far along he has gone?

Mr. A. L. HARRIS. That is in its infancy yet.

The WITNESS. This point is to be noticed: He said he wanted all the feeble-minded. Some are totally incapable, while some can do work. Those classes of people who are below the level of independence can be made self-supporting if put under skilled management and organized in that way. If they are taken out of our centers of population, out of the crowded sections, tenement houses, and indoor work generally, and put out of doors under management which can make their work compulsory—not penal, but compulsory—there is a chance of making them self-supporting, and a certain number of them can be restored to efficient workers, capable of being passed out into industries in general.

Now, there is no reason in the nature of things why that remedy is not applicable to tramps and drunkards. The Australian colonies have applied it to drunkards. The man who is convicted of the third offense of public intoxication or shown by medical examination to have something like insane indications is committed to one of these colonies. The law has not been perfected, but they are working along with that idea in mind. Massachusetts has a dipsomaniac hospital, where drunkards are sentenced with the idea that they may be cured, but they have no provision for compulsory work. They are meeting with no great success.

In our prisons and county jails—I am speaking of the one at Syracuse, in New York, which I know more about—I think 40 per cent of the commitments in the year are tramps. It is supposed to be a workhouse. Some 900 tramps come in every year under commitment, sent up from different counties, and supposed to work. What they really do is to hatch criminals. It turns the tramp into a criminal. Now, if there could be some way devised whereby these tramps could be sentenced, not for 3 months, during the cold weather, but until cured, until they have learned how to take a job and keep it, learned some useful trade, not necessarily making them skilled mechanics, but good farm hands or people who could work on large contracts or something of that kind, so they would get the habit of industry, we would do more than anything else which has been suggested to meet our present problem—the tramp problem and a very large part of the unemployed problem. That is, to apply to the tramp and drunkard compulsory work, but rid it as much as possible of the penal idea, and that would be brought about by adopting the colony principle, where all the people live outdoors, have their own houses, where there is a sort of seeming independence. They have schools and churches and can have associations of several hundred together, conducting a little community, but under management and supervision.

In Holland they have carried that idea a little further, and have a compulsory beggar colony, or free-labor colony, that I take it is provided for this partially incapable class of people, who border on the feeble-minded, who are next door to those cared for in the epileptic and feeble-minded colonies—that kind of people who have never learned how to work, never had any training, technical or otherwise, and have not learned how to save money, from different causes—people who are provided for in most of our almshouses. The almshouse need not have the stigma of pauperism even for these tramps who are thrown in. It could be made a labor colony, where those partially capable of work could be employed, and that, I take it, is the idea of the labor colony in Holland and the one now started in New South Wales.

Q. (By Mr. CLARKE.) Do not unemployment and tramping find encouragement by indiscriminate giving on the part of the people?—A. I think the reason why people do give indiscriminately is because the burden of proof is on the one who gives and not on the tramp. The tramp says he can not get work, and therefore you give him something. You do not want to make him starve if he really can not get work, and the burden is on you to prove that he can get work. But in Holland it is known by every citizen that there is a place where every tramp can find work; and if he is going up and down the country begging, the burden of proof is on him as to whether he should not be in one of these free colonies or one of these compulsory colonies. And I believe in Germany public begging has practically been abolished owing to the establishment of these institutions.

Q. You have heard of the experiment in Cambridge, Mass., where, without any law on the subject, the people came to the agreement that the city government

should establish an opportunity for some crude kind of work, like sawing wood, and that tickets should be issued to all the inhabitants, which should be given by them to any tramp who applied at their doors; and if he would take a ticket to that place he could get work and have a lodging, but if he appeared without a ticket he could not. In that way the people were saved from giving either food or money, and the tramp was actually benefited as well as temporarily relieved.—A. Yes. Of course, I think that will work to some extent, but it does not have the full educational value, in that it does not keep the man long enough or give him any training or any steady habits. These people who are tramping are really people who are defective, in a way, and they need some sort of discipline. They need something that will restore in them the habit of continuous work, and that is the advantage of this idea.

A great many people are out of work because they do not know where to go for work; and I suppose the systematic establishment of employment bureaus would be something that might be well considered. We have State bureaus in some States. There is one thing I would like to say about these State and city bureaus, and that is this: As far as I have observed them they are not efficient, mainly because they are considered as a political appointment. That is true in Ohio, or was some years ago; I am not certain how it is now. The difficulty is that the man in charge is not acquainted with employers in the neighborhood and does not know who wants employees. In Seattle they have met that pretty well, if I am rightly informed. There the employment bureau is put in charge of a commission of unsalaried citizens—leading business men. They can give their time to it, because it does not take much of their time—just the same as they give their time to any charity they may belong to. The State does not appoint the agent, but they appoint their own agent. He conducts the registration and makes the acquaintance of the employers under the direction of these business men, who are themselves employers. That is an idea that is worth considering. Where you simply have one man appointed as the head of a local employment bureau, whether it is a political appointment or otherwise, the chances are that you will not get a man on an ordinary salary who would have connections with employers. It is necessary to bring in some sort of employers' committee that shall itself be interested in lessening the unemployment, and shall be careful that the men recommended shall have some recommendation, so the employer taking them on will not be disappointed and thus lose confidence in the bureau. I think the public bureaus have had that defect; and so far as the private bureaus are concerned, they have not accomplished much in doing away with unemployment, their work being mainly with domestic and hotel work.

Q. (By Mr. PHILLIPS.) Has there been much done in the way of public institutions by the States?—A. In New York and Ohio, and probably Illinois.

Q. That is, in a limited way?—A. Yes, in two or three large cities.

Q. Is there one in New York City?—A. There is one in New York City—three in Ohio.

Q. Do you know what appropriation the one in New York City gets from the State?—A. I do not think it gets very much.

Q. (By Mr. FARQUHAR.) When you speak of utility of these public employment bureaus, do you take cognizance of the fact that all the labor unions nearly provide for all their unemployed, and for those nonunion men who come under their jurisdiction?—A. Yes; I am glad you stated that.

Q. That leaves the great body of unemployed as unskilled labor?—A. Certainly. It has been shown in London and in this country that at times of depression practically no union man has applied for relief from the public authorities. He is cared for one way or another by his union.

Q. What is your opinion of the practical worth of these charitable associations in cities, in providing work and shelter and food for the unemployed?—A. Well, I do not like to make any sweeping statements. I can only speak of those I happen to know, and I do not like to mention those. But I think, as far as I know, they are very unsatisfactory. They are very often imposed upon—too often. They are not critical as to the worthiness of applicants. The man that takes an active part in the religious exercises is more apt to get help than one who does not. My prejudice is strong against these bodies. I think they ought not to be encouraged, or if they are, it should be under very strict State supervision of some kind, such as the State board of charities and correction.

Q. (By Mr. CLARKE.) You think they mean well but do not know?—A. Yes. They have not this connection with employers, and they usually degenerate into soup houses and indiscriminate relief. I had a very striking experience of that kind investigating one of these agencies. I was referred to one of these societies by a wealthy gentleman whom I knew quite well. He was a patron of this

40 INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

agency and was very proud of it, thinking it was doing a great work. I took special occasion to investigate it fully and find out what it was doing. I think his money was worse than thrown away.

Q. (By Mr. FARQUHAR.) Do they encourage pauperism?—A. Yes.

Q. (By Mr. PHILLIPS.) Can you describe briefly in what way the money was thrown away—the particular objectionable features about that kind of work?—

A. The special reason was what I mentioned a moment ago, that there is no strict examination. Men are put in charge usually who have made a record as good men in religious work, and they do not seem to be able to detect these frauds that come for relief.

Q. (By Mr. CLARKE.) They are gullible?—A. Yes.

Q. (By Mr. FARQUHAR.) Have you any remedy to propose to eliminate these chronic frauds?—A. Make them work.

Q. Compulsory work?—A. Compulsory work. Not penal work, but compulsory work. Make a difference between compulsory and penal work, and then we would educate the public.

Q. You would have to have a criminal commitment?—A. You would have to have the court commitment, but the penal character of it would be done away with by the fact that it was out-door work, where they have no fences and no walls as in these boys' reformatories; something of that kind, where the young fellow is sent and can escape—they do escape but are captured again, and if a few do escape it does not matter much. The general principle will hold, I think. The main trouble is that the sentiment of the public is against coercive measures. Men get commitments to the penitentiary and jails, and it has a vicious influence. It makes them criminal because they get in a company of toughs, and they spend their time learning high crimes. Now, if they can be sentenced to a place where they do not have time to loaf, where they get tired, and where they learn something, the public would not be so sentimental. They would still be humane but firm enough to effect a remedy. The reason why I dilate on it is that I think the number of people of this kind—drunkards and tramps—is increasing.

Q. (By Mr. PHILLIPS.) What would you do with the product of their toil or labor?—A. That is a difficult question.

Q. How is that managed in Holland?—A. Their object is to do away as much as possible with machine labor and have most of the work hand labor, and to manufacture the things which they can use in their colony rather than things which would be sold on the market. They have one tract 16 miles long and I do not know how wide, but it is a large area. It would seem that under proper management such people could be made largely self-supporting without dealing with the outside world, if you have a colony as they have there in Holland.

Q. Do they not after a certain time allow them a certain amount of ground for their own use?—A. In the free colony they can go with their family, but I think the New Zealand and Australian method is superior in that respect. The criticism is made that in the free colony in Holland, by giving the beggar the idea that he can stay there always, they do not present a sufficiently high aim or goal. They simply locate there, have their family, and multiply and produce incompetents.

In New South Wales the parliamentary commission that has been sitting on that subject has just proposed that this colony be a temporary place, and that having shown his competency there, he can be promoted, as it were, to a homestead on Government land. That is, the Government makes use of the unemployed to clear off the prickly pear, for example, where the land is being ruined over a large area by that plant. They clear it off and drain it, and having thus opened it up, they take those more competent and transfer them to the assisted settlements, or something of that kind. They carry with them a cow and a horse, possibly, and the Government loans them something at 4 per cent and does not tax them on the improvements, but simply on the land value. So they are encouraged to get all that they can out of the settlement.

They have considered that very fully in New South Wales, and the plan which they recommended last year seems to be quite interesting, but whether it will work out I do not know. Of course, in this country such a remedy depends on having a large tract of vacant land, and if that were at all contemplated, it would probably have to be by the National Government, because it would be necessary to have these people taken from the Eastern States onto the land.

The Salvation Army carries on such colonies out West, and the railroads out there are encouraging it. They give them cheap transportation and they have helped them a great deal in starting these colonies. If some large enterprise were undertaken of that kind, some plan worthy of the subject, it would doubtless receive the assistance of the railroads, as they have already done such work, and it might accomplish something.

In New Zealand I think they have the best labor gazette which is found in any country. France has one, as has also Belgium and England. There is none in this country. The labor gazette is simply a monthly publication which describes briefly the state of employment in the different cities and localities and the rates. Now, a workingman would want to know where would be the best place to go. He sees that in Auckland things are rather overcrowded. Here are a number of other places where there is a demand for labor. The ignorance of our unskilled laborers, who have not the benefit of labor unions, as to where to go—and in a country of this kind the difficulty is greater than in a small country—would be overcome largely by such a labor gazette. At least one of the labor unions in this country that I know of has created an interstate agency of that kind, the center being in New York, and they keep in touch with employers throughout the country and agree to furnish them labor. Then they have reports every week as to the number of men out of employment in the various unions, and they can send word to the local to send men to that place. The labor unions can take up a matter of that kind much easier than the unskilled laborers.

In general, it seems to me that for relief for the unemployed we must look toward agriculture, toward the reconstruction and resurrection of agricultural conditions. This came to my attention especially in New York about 3 years ago when the association for the improving of the condition of the poor found that men from the country were crowding into the city, and so they sent out 2 commissioners into New York State to find out why people would not stay on the farms. They found out that 86 per cent of the children of farmers refused to stay on the farm. Those are the figures which they give. Eighty-six per cent of the farmers' sons refuse to stay on the farm, and a large per cent of the farmers themselves would come to the city if they knew how to do it. But this commission found also that there was one section of New York State where that was not true, and that was around Cornell University, where, owing to the experimental station there and the activity of the station, they had educated the farmers of that neighborhood in scientific agriculture, in diversifying their crops; and so on, and had made agriculture both interesting and profitable. That was 3 years ago, 1897. I do not suppose similar things could be said at the present time about agriculture. It is doubtless in better shape. In general, their remedy was that in order to relieve the poverty and pauperism and unemployment of the cities something must be done to get men back into the country. And this labor-colony idea is one of the remedies along that line.

Q. (By Mr. CLARKE.) The labor-colony idea is based primarily on public improvement of some kind, is it not, rather than a private productive enterprise?—A. Yes.

Q. (By Mr. FARQUHAR.) Reclamation of waste land, etc.?—A. Yes. When we come to public employment there is one thing that ought to be said: Public employment naturally occurs to most people as an immediate remedy, furnishing relief of some kind, but this thing is to be noted, that if it is to be effective relief the employment should not be made through contractors. It should be made a matter of direct employment by the public authorities, hiring the men themselves and paying them the wages and planning the work. If you will remember the reports made a short time ago as to the distribution of this million dollars in Porto Rico to assist unemployment, you will remember it was done through contractors and there was much complaint that they cut the wages, as they could do in a period of depression, and they compelled the men to purchase from company stores, and so on, so that the benefit designed did not accrue. That is not an isolated case. In general, it is found that work of that kind must be under the direct employment of the state to avoid that difficulty.

In English states and recently in this country the laws regarding the prevailing rate of wages have been aimed at that evil in a way. In London and in Great Britain it grew out of the investigations in the sweat shop, and it was found that army clothing was being made in sweat shops by contractors at very low pay. So the Government introduced a clause requiring that in all public contracts the prevailing rate of wages be paid. In London the difficulty of enforcing that contract has led them to adopt in a good many cases the municipal construction of public works—that is to say, they create a board of public works and they have constructed in London so far insane hospitals, public buildings, tenement houses, and have put down paving, sewer work, and laid pipe, and different things of that kind. Now, in the work they have done there one policy that they have adopted has been to increase the activity of work in the winter, when private employment is slack, and thus to take up the unemployed as much as possible.

It is an interesting experiment in Boston in that regard which has been made in the waterworks department. The waterworks department in Boston is endeavoring to give steady employment now to its men rather than throw them off its

the winter and make them a public charge. I do not know how they are doing now, but 2 years ago, I know, they had machines for thawing out the ground, even went so far as to have steam machines to thaw out the ground in order to lay water pipe in the winter; and they made the report that it was done as cheaply as it was under the old system, under the old circumstances—that is, taking the whole staff and the way in which they can readjust and reorganize the staff, the department can lay pipe in the winter as cheaply as before. Whether this is carried out by later experience, I do not know.

Q. (By Mr. CLARKE.) I suppose you are aware that the metropolitan water board is carrying on a great deal of new work. How would it do in a city where there is no new work to be undertaken, except occasionally to extend a main?—A. That is, what kind of work would be found for winter work?

Q. Yes.—A. Well, in our northern climate that is very difficult. I have heard a great many projects, and I think that is practically the difficulty of charity organization societies—to find a quantity of winter work. The only thing that I can mention is that if you have a public department, a street department, or water department, or sewer department, that makes it its policy to increase the winter employment rather than the summer employment, it would be able to discover ways of doing more than is being done now. In London it is being done, and this one example in Boston is the only thing I know of in this country.

Q. You would recommend that this whole matter of public employment should be divorced from politics as much as possible?—A. Yes; without doubt. As to politics I would like to say this: I think, practically, the greatest discovery made in public employment in this country was that which Colonel Waring introduced into the street-sweeping department in New York. He took men who had been under a régime of the grossest kind of political favoritism—about 2,000 street sweepers—and made them effective. The principal thing he did was to organize them into a self-governing board of arbitration, in a way. There are 40 stables and some 50 men in each stable on an average. He had each stable organized into a union, as it were. Then, in that way, the 40 stables each elected one member to the board of representatives of the street sweepers, which met by itself in secret, the commissioner himself having no representative there. Now, if anybody made a complaint against a foreman on account of ill treatment, for instance, his representative carried it before that board. If that board agreed that it was not well founded, they turned it down and that was the last of it. If his fellow-employees would not sustain him he had no chance whatever. And they turned down about two-thirds of the complaints in that way. If they agreed that the complaint was well founded, it was then carried up to a board composed of 5 members elected by this representative board of 40 and 5 other members appointed by Colonel Waring himself from the superintendent's staff. These 10 men considered this appeal of this employee against the foreman, and they settled in that way every case that was brought before them except one. There was only one that went to Colonel Waring himself, and he decided in favor of the man in that one case.

The idea there it seems to me is this: Under any system of public employment in this country we are bound to have the workingmen get the idea that they can appeal over the heads of the foremen to somebody. They will appeal to the alderman, to the district leader, to the political boss; they are going to have the appeal. Now, the ordinary political machine, as instanced by Tammany in New York, lives on that kind of thing. Waring took that all out of their hands. The alderman, the boss, or the district leader could go and deal with the head of the street-sweeping department. But he created a tribunal with rules of procedure and with records so that complaints could be dealt with in such a way that fairness could be secured. The result was that if that had been continued the street-sweeping department would have continued in that high state of efficiency which it had during that time and which was very remarkable.

Q. (By Mr. FARQUHAR.) But in the cities where the street sweeping is done by contract, and the city sometimes divided into 3 or 4 or 5 districts, it is impossible to carry that out?—A. You can not do it by contract. It is based on direct employment.

Q. (By Mr. CLARKE.) Why was Waring's system discontinued in New York?—A. I am not able to say. I suppose they did not want to have self-government.

Q. It was a result of the political change, was it not?—A. This lasted as long as he held. Several other changes took place at the same time.

The most evident, patent, and obvious cause of unemployment in this country is immigration. I have talked with officials on that subject, and they will say that after investigating the subject they can not locate any place, can not say definitely, that immigration does cause unemployment; but if you mean in New York State, New York City, the industries, if you mean tobacco workers, or the

garment trade, or stonecutters, why, they will have to make a concession there. In those cases immigration does cause unemployment. It seems that immigration in our Eastern States with reference to the unskilled labor is a very serious matter in the question of unemployment. Some of the unions protect themselves in interesting ways. There is one union that charges \$50 initiation fee for a foreigner and \$3 for a naturalized citizen; and then another union, the engineers' union, has induced the State of New York to pass a law that the license for stationary engineers should be granted only to citizens. There are a great many ways like that that are coming in to protect the local and different labor interests. In those trades that are affected there seems to be no doubt that there has been a decline, not only a decline of wages, but where the union had been able to keep up its wages they complain that the amount of employment has decreased, owing to the increased number of nonunionists; and, of course, the immigration breaks down the unions.

EXPLANATION OF CHART.

I have drawn up another chart here, which may be of interest to you [producing chart]. As you, of course, know, immigration comes to this country only during times of prosperity, and I will show you the line of prices. The solid line indicates the prices based on the average prices for the period 1870-1880, showing, first, the period from the depression from 1879 to the great prosperity of 1881 and 1882, and then the depression of 1884 and 1885; then the depression of 1893, and this recent period of prosperity. The other line, the broken line, indicates the amount of immigration into this country, and you will see the two lines are practically parallel. The number of immigrants rose from something less than 300,000 in 1878-79 to 800,000 in 1881-82. I do not think that adds anything to what you know, but it brings out distinctly and clearly that immigration depends upon opportunities in this country—that is to say, the immigrant is not going to come where there is no work. He is not coming to this country unless he has prospects of a job, and he has pretty good knowledge, because most of them, I believe, come through correspondence with their friends in this country. In periods of depression, of course, this immigration matter accumulates with other causes, and although there is a smaller number that come and a greater number that go back, yet at that time it creates more unrest. During this period of prosperity I have taken pains to ask some labor-union people in New York, and they complain that owing to the immigration they have been unable to get any increase in wages commensurate with the increased prices.

Q. Do you think that is an enlightened judgment of theirs?—A. I do not know. That is just talking with some of the leaders. I have not gone among the men or the employers, and I have not made any special study of the subject; but that is the way they talk about it. I do not know to what extent that would be sustained.

Q. (By Mr. FARQUHAR.) Is it also a fact that those immigrants that have been coming in have been able, by staying here 3, 4, or 5 years, ultimately to learn trades and displace Americans?—A. Yes; I suppose so. Of course we have to make a distinction between the different immigrants who go to the places where they start for. If they are distributed out in the West, if they go out where there is a demand, then of course the pressure is not so great, but in the Eastern cities and States it certainly is a very serious matter. You remember when the canal was built in New York State. I think that appropriation of \$9,000,000 was largely owing to the labor vote. They thought they would get a job. What did occur was that the contractors brought in Italians, and the Italians did not patronize the merchants, and when the contractors finished the job they left the Italians there for public charities. That is what was done, and a particular case like that ought to be met in some way. Whether that involves a similar judgment on all industries is another question. Each race and each trade should be taken up, and each section of the country may have a different evidence.

There is one thing I ought to say, I think, about the statistics of immigration. That is the alleged greater criminality of foreigners. It is often stated, I see, that the foreign born furnish more than their proportion of criminals to our prisons and penitentiaries. If you will notice the way in which these figures are compiled, they are usually based on a total population of foreign born. Crime is a phenomenon of adult population, and of a male population, practically, so the comparison ought really to be based on a proportion of the criminals or commitments compared with the proportion of adult males in some race or nationality, foreign and American. For example, the foreigners come to this country after they are 15 or 18 years of age. Their proportion of adults is much larger

than the native. I think about 47 per cent of native-born Americans are over 21 years of age, while 85 per cent of the foreign born are over 21 years of age. Consequently, the foreigner might have nearly twice as much crime, compared with the total population, as the native born, and yet, compared with the adult population, they would have only the same quantity of crime. That has been pointed out by some statisticians, but in the popular literature it does not seem to have taken hold yet, and statistics in the census are made to show worse against the foreign born in the matter of crime than the case actually warrants.

Q. (By Mr. FARQUHAR.) Is it not shown by the sociological studies in this country that the first generation of the foreigner is the one that contributes largely to the criminal classes?—A. That is very true. The point, however, is this: I think that the foreigner and the children of foreigners contribute more largely to the minor crimes and misdemeanors—drunkenness, etc.—than they do to the large crimes. For example, I figure out on this basis: In the matter of prisoners in the prisons in 1890 on commitments for drunkenness the number of foreign-born children was five times as large as of native-born children; whereas on the general average of all crime it was only a little over 30 or 40 per cent higher, showing that their preeminence in the statistics comes from these minor crimes. Now, in any treatment of the subject that ought to be taken into account, undoubtedly the foreigners and children of foreigners are the worst element which we have in this country—the native-born children of foreigners are the worst element. They are the hoodlum and bum element, not the tramp element necessarily. The tramp element is largely American stock. They may be the second generation of foreigners, but largely they are American stock.

Q. (By Mr. PHILLIPS.) How does it come that such a large per centage of tramps are American or English-speaking people?—A. I will tell you one thing I noticed in the printing trade within the United States. There are a great many tramps in the printing trade, old fellows, on the road. Along in 1875 and 1876 there was a depression. You remember a great many people, almost the same as Coxey's army, were roaming at that time. I do not know why those American printers should have started out at that time: a number of them were well-educated fellows; but they were men who had probably been dissolute and drunkards and were not steady, and it is that kind of men which are on the road. But the German printers are a very steady set. I do not know why it is.

Q. (By Mr. FARQUHAR.) In the printing trade was not a good deal of it accounted for through State printing, which brought men from various sections for State-printing work in winters?—A. Well, that is a migratory trade.

Q. (By Mr. PHILLIPS.) A large per cent of foreigners are employed on railroads and public works, and Americans may not like to work with them, and hence seek other employment. Does that enter into the tramp question very materially?—A. I should think it did.

Q. (By Mr. A. L. HARRIS.) Was tramping in a trade somewhat encouraged by what is known as tramp States helping them along from place to place?—A. Yes.

Q. (By Mr. FARQUHAR.) Did many of these unions, up to 1880, in issuing these traveling cards upon which the men could get help if they wanted it—which they very seldom did—encourage this tramping?—A. Yes.

Q. (By Mr. CLARKE.) Have you discovered any reason why the children of the foreign born should be hoodlums any more than the children of native-born?—A. In the case of the foreign born parent, the father and mother, we will say, can not talk English, they can not keep control of the children. The child goes out and disobeys. If he were in his own country, and the parent knowing all the neighborhood and the interests and surroundings, and the child himself being disciplined by outsiders more directly, they could keep the child under control; but they break away here. I do not know how accurate I am, but my idea is that it is the Irish young that swell that number more than any other. I doubt whether you find the children of Germans and the children of Italians as bad as the children of the Irish. I can bring other authorities that concur with me. I can not be held to figures on it, but it is simply my general impression.

Q. (By Mr. CLARKE.) Would compulsory education—A. (Interrupting.) Compulsory education? The schools come up against that question with reference to the compulsory education law, and I think they find that the children of foreigners are more difficult to deal with.

The State of Minnesota has practically wiped the hoodlum element out of Minneapolis and St. Paul, and they have done it through what they call the board of State guardians for children, which has authority to go into the cities and take these children away from parents who are unable to control them and find homes for them in the country—put them on farms—and keeping careful supervision over them. They have been at work on that for nearly 20 years. The State board of

charities claims that the hoodlum element is practically wiped out of St. Paul and Minneapolis. That seems severe and harsh, but it is done largely through moral influences instead of actual numbers taken out. Of course, when one family sees a child taken away from the neighbors it has a good effect.

Q. (By Mr. CLARKE.) Have you studied the statistics of Massachusetts in regard to that system?—A. Yes; I am acquainted with the officials there and have looked into that.

Q. (By Mr. PHILLIPS.) Are they doing the same kind of work in Massachusetts?—A. Yes; and in Washington here the board of guardians is doing good work. Indianapolis has one.

I have been quite attentive to the subject of arbitration on account of my interest in compulsory arbitration. I have inquired among labor people as to what was their objection against compulsory arbitration, and I find that their objection is simply that they distrust the courts, and the employers, some of them, say that that is their objection. If that be so, whether the ground is sound or not, it is something that might be met in another way. We have to distinguish between the two elements of compulsion in the arbitration scheme. One is the compelling of the enforcement of the award, and the other is compelling the award to be made. Now I can not see why it would not be possible to divide those two propositions and enact a law, especially in the case of railroads and street cars, which would compel both parties to provide and especially to reach some sort of an agreement. If it were done by a shrewd judge or presiding officer, in the case of compulsory arbitration, he would act as a mediator, with the assurance on the part of both sides that if they did not themselves reach an agreement he would have the ultimate power of deciding. Now, I can not see, if that condition comes, why it is not possible to devise some way of simply compelling both sides to come into a court, or into some sort of a body, by which it should not be held necessarily that any one man should decide between the two, but that they should in some way reach an agreement. That, I understand, is largely the way it is done in New Zealand. At the same time we can not have a compulsory law until a great majority of the people are in favor of it, and I believe the people are in favor of such a measure at the present time. There are but a few employers—and it is mostly the employers, I believe—that would object, that stand in the way of arbitration. It was so in the anthracite case. There are but few employers that really reject it. The great majority of employers are in favor of it, and the compulsory law is simply a necessity on account of those few that hold, as it were, a strategic position, for by refusing to consent to arbitration they can compel their competitors to refuse. A man that will not consent to arbitration will not have the right conditions in his business, and owing to competition can undersell the others. Now, the coercion principle is usually misunderstood in this country. It is not coercion in the sense that it is going to compel all employers or all unions to submit, but is coercion with nine-tenths of the employers and nine-tenths of the unions which can be dictated to by this other tenth owing to its strategic position. If it is put in law the public then has a right to demand peace. These few that are holding out and standing out against it—as they have an advantage, as long as we do not have some sort of compulsion they can not be brought into court to make some sort of an agreement. As to whether that could be done or not I do not know.

Q. (By Mr. CLARKE.) Do you think that the public have a sufficient interest in the subject to justify public interference in private dispute in all cases where large numbers are concerned?—A. I think in certain disputes the public has an interest. That would be a question for each investigation, as to each interest.

Q. (By Mr. FARQUHAR.) For instance, the Cleveland surface railway strike?—A. Yes. I should say there, decidedly.

Q. Positive interference on the part of the public there?—A. Yes.

Q. For the regulation of a public utility?—A. Yes. They prostrated business, they destroyed confidence, and they injured the community, so they must be brought to terms. It is not that justice can be done that the courts are established. Some great lawyers claim that the courts have decided wrong just as often as they have decided right. It is not in order that absolute justice may be done, but that the settlement may be made, possibly, and that the community may go on. If they make one decision wrong, there is a chance to make another right. The next decision may be reversed and progress may be made. There is always a chance to improve. No justice can be made on one side or the other under conditions of violence or public disturbance. It must be done under the supervision of a tribunal of some kind that has power to a certain extent. As to how far they will go, that is a question for lawyers.

Q. (By Mr. FARQUHAR.) You are not sure, then, that compulsory arbitration could obtain in this country?—A. With the public?

Q. Yes, or with the workingmen, organized or unorganized.—A. I think at present they distrust it.

Q. Then your judgment would lead this commission to report in favor of remedial legislation coming as close to compulsory arbitration for a full settlement as might be found possible?—A. I should think you could go as far as I have mentioned—compel the two sides to make an agreement and leave the actual enforcement until later.

Q. What do you think of the provision of the Ohio law that a joint application to the State board may contain a stipulation that the decision of the board shall be binding upon the parties to the extent stipulated and that the decision may to that extent be enforced as a rule of court in the court of common pleas in each county?—A. Well, it is still possible that one side may refuse to make any stipulation, may refuse to come in. I should say that that Ohio law is good as far as it goes. That is an excellent feature and should be added to this, I suppose. But my idea is that in addition to that there could be some provision by which not merely the party that prolongs the controversy should be punished if he did not offer arbitration, but the other party if he did not accept arbitration could also be punished, then leaving the enforcement to a series of stipulations between the parties.

Q. Do you believe it would be a favorable condition to always have a stipulation in all these acts of the legislatures that both parties, when they come to disagreements of that kind and notice comes to the State and local boards, shall remain in status quo—the men remain at work?—A. Yes, and then possibly both sides appoint representatives, or have some provisions to appoint them, and they should be brought together under such circumstances and make some agreement, and then add this feature of stipulations as to what they would abide by, if necessary. I believe with that step in advance it would soon come to be so apparent, and the majority of the court decisions so just, and their time being limited to 1 year, that it would not be very long before the public would perceive and the unions themselves would perceive that they could accept the further addition of compulsory enforcement.

Q. There is, as you are aware, quite a strong feeling in this country against the court in the matter of injunctions. Would not these mutual stipulations for trade agreements of unions with employers practically do away with a great many of these injunctions offensive to the public and employees?—A. Yes. They occur only in cases of dispute. The injunction does have that disadvantage, that it does not give a hearing, while arbitration gives a hearing. If the courts that issue injunctions would at the same time constitute themselves into a tribunal for hearing, they might reach the matter there directly without legislation. I do not know but they have a right to do that.

Q. (By Mr. CLARKE.) You do not mean to say there is no hearing in the case of the injunction? You refer merely to temporary injunction?—A. Temporary injunction.

Q. (By Mr. A. L. HARRIS.) When the public is called upon to protect life and property, has it not a perfect right to compel some kind of an adjustment of the trouble?—A. And then enforce it?

Q. Enforce it: yes.—A. There is one thing about the enforcement of an order that I am unable to get around yet. If the decision is against the unions, it means a compelling of personal service, which is contrary to our ordinary view of labor contract. A labor contract is a contract which is not enforceable against a laborer, as a rule; and if you compel a laborer to keep at work, he brings the objection that it is returning to a species of compulsory labor, and I have not thought out yet just how much weight that ought to have. My idea is, though, if we could see the thing at work we would see that that objection was visionary; that it would not be such an injustice; but we have not seen it at work yet, and we do not know but we ought to get the situation especially so we can see it at work, for the public usually judges by results, rather than by reasoning. I would say, as a general principle, that the public has a right to enforce that and has a right to take away a man's liberty, if necessary for peace and welfare, but it must do it cautiously, because it can not create an uprising or create disaffection which would overturn the laws as a whole.

Q. (By Mr. PHILLIPS.) Would it be a great injustice to the employer of labor to compel him to pay an advance, for instance, when his profit would not justify it?—A. Yes, if the court should be so ill informed as to render an unjust decision; then, of course, it would be a hardship to enforce it. The whole thing turns on having an honest and well-informed decision. The decision ought never to be made by a court, a judge, if possible to avoid it—that is, the decision ought to be made by the interested parties. It ought to be a conference, a compulsory conference of the two sides, and they ought to make the decision. The judge's busi-

ness is simply to preside and bring them together on points of difference and see if he can not overcome the narrow and unessential differences, and he ought to bring them down to the point where they agree on something.

Q. What would you think of a law compelling the laborers, before they went on a strike, to arbitrate or apply for it, or vice versa, in a lockout; on the other hand, that such a thing should not occur until they had practically arbitrated it themselves?—A. Yes.

Q. Compelling an arbitration among themselves before that could occur?—A. And then I would go a step further. Besides that, say, if the laborers were going to strike they must propose arbitration, and furthermore the employers must accept arbitration, and the two sides must be brought together.

Q. And the same in the case of the lockout?—A. And the same in the case of the lockout—that is, the side that takes the initiative, starts the wheel in motion, and then the other side must respond and the two be brought together under the supervision of the State.

Q. (By Mr. A. L. HARRIS.) In your opinion would a compulsory arbitration law be conducive to trade arbitration?—A. I think so. My idea is—and I am rather worried about it that it has not worked out so well in New Zealand in that way. I expected in New Zealand there would be more disputes settled outside of court than in the court. I do not know why it has not occurred; I thought it would. My idea was that, knowing they must come to a decision through public authority, they would much prefer to come to it, as many are doing now, through their own conferences.

Q. (By Mr. CLARKE.) Probably that very fact, that cases are being carried to the courts, shows that the parties in New Zealand are satisfied with that way of adjustment.—A. Perhaps that is so. Of course the judge who decides in New Zealand is an appointee of the Crown. He is not subject to politics. He is appointed by the governor-general, who is an appointee of the Crown, and he is as near independent as any official can be found in any place; that is, he is as near independent of local politics as any official can be found in any place. We have nothing like it in this country. That is where the colonial possessions of England have an advantage above party politics, and consequently they seem to have some advantage in the matter of judges.

Q. We have a near approach to it where the judges are appointed by the governor of a State, or the President of the United States, with the advice or consent of the Senate—appointed for life, or during good behavior.—A. The trouble about that is this: The trade unions distrust judges who are appointed, and the employers distrust judges who are elected, and the situation is insolvable under our institutions; but in New Zealand the judge is neither elected nor appointed; that is, he is not appointed by a man who is elected. With us he is appointed by a man who is elected. That is the difference. I think there can hardly be any doubt that our courts have been appointed with reference to their views on constitutional questions; whether on other questions or not, I do not think it can be shown. But Massachusetts, by the way, is the only State which appoints judges. All the rest of them elect.

(Testimony closed.)

WASHINGTON, D. C., November 13, 1900.

TESTIMONY OF HON. LYCURGUS P. McCORMACK,

Labor Commissioner of the State of Indiana.

The commission met at 10.55 a. m., Vice-Chairman Phillips presiding. At that time Hon. L. P. McCormack, of Indianapolis, was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. FARQUHAR.) Please state your name, residence, and official position.—A. Lycurgus P. McCormack, Indianapolis, Ind.; labor commissioner for the State of Indiana, representing the labor interests.

Q. What has been your experience in the ranks of labor?—A. I am a printer by trade; worked at the trade for pretty near 40 years at different times, almost continuously for 35.

Q. Have you been a member of the local or national unions in that time?—A. Yes; for 34 years.

Q. Are you now still connected with the printing body?—A. Yes; I am still a member of Indianapolis Typographical Union, No. 1, and also a member of the International Typographical Union.

Mr. FARQUHAR. If you have any paper to read, the commission would be pleased to hear it now.

The WITNESS (reading): "Arbitration, as a means of adjustment of differences between capital and labor, is rapidly gaining popularity in Indiana. In some trades it has almost taken the place of the strike. Approval of this instrumentality finds strong expression in the ranks of labor and is more constantly championed among the practical workers and thinkers on economic subjects in labor organizations. In some trades so popular has this method become that in annual contracts in which wages and working conditions are agreed upon for the ensuing season provision is made that all controversies which may arise shall be settled by arbitration without cessation of work. Not only is it true that arbitration is prescribed, but the observance of the agreement is made mandatory.

"The trades which hedge themselves about with such precautionary legislation are not few, but many. Equally gratifying is the fact that the trades most friendly to arbitration in Indiana are those represented by the older and stronger organizations. In many of these organized industries of Indiana, wages, hours of labor, working conditions, and other controversial matters are taken up by delegated representatives of employers and workmen in annual convention, and after a series of negotiations, sometimes extending through weeks, differences are adjusted and agreements perfected which enable the contracting parties to continue in harmonious relationship during the life of the agreement. Thus the industrial situation, in so far as strikes are concerned, is very greatly simplified. With these settlements occurring annually and being observed in a spirit of sincerity, there is growing up a better feeling through a fuller confidence and a stronger sentiment of reciprocal dependence and trustfulness. Moreover, there can be no doubt that in many instances better results have been secured by arbitration than if strikes had been employed as a means of settlement. Brute force, as typified by the average strike, involves so many of the elements of repugnance and naturally arouses such a degree of combativeness that even where settlements are made by means of them the conditions are, in many if not most instances, less advantageous than if a more peaceful and rational method of conciliation or arbitration had been employed. By no means the least harmful evil growing out of strikes is the continued effect of the resultant estrangement. This estrangement not infrequently lingers long with employers after the unfortunate events which produced it have grown dim with age in the mind of the public and possibly of the workmen as well. It retards future negotiations, chills whatever friendly feeling or sympathy may have existed for the striking workmen, creates a lack of confidence, and lessens the prospects for the establishment of those more friendly relations between employer and employee the existence of which is so essential to congenial cooperation and mutual prosperity.

"The interest which the public has in the peaceable settlement of industrial disputes strongly emphasizes the importance of arbitration. Commercial and industrial interests are becoming more closely interwoven and their interdependence more firmly established day by day. There is no such thing as independence either in industrial or commercial life. Dependence is mutual. When, therefore, this mutual relationship is strained by the unusual conditions which a strike begets, the evils are felt through the entire correlated interests. Thus upon innocent persons are entailed pecuniary losses. This fact forces us to confront the proposition, Is it not the duty of the State, and under some circumstances the General Government, to reduce these recurring disturbances to a minimum by proper legislation? Indiana has done much in this matter. The legislature of 1897 established a labor commission. The law requires that the commissioners shall be appointed by the governor and shall hold office for 4 years. It further requires that one of the commissioners shall have been for not less than 10 years an employee in some department of industry in which it is usual to employ a number of persons under single direction and control, and shall be at the time of his appointment affiliated with the labor interest as distinguished from the capitalist interest or employing interest. The other commissioner shall have been for not less than 10 years an employer of labor in some department of industry in which it is usual to employ a number of persons under single direction and control, and shall be at the time of his appointment affiliated with the employing interest as distinguished from the labor interest. Neither of such commissioners shall be less than 40 years of age, and they shall not be members of the same political party, and neither of them shall hold any other office during the time for which he shall be appointed.

"The commission has a dual character; it is both a board of conciliation and a board of arbitration. The law declares it to be the duty of the commission, upon receiving information in any manner of the existence of a strike, lockout,

50 INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

boycott, or other labor trouble within the State, to go to the place where such trouble exists and offer mediation. If this is refused or fails, then it becomes the duty to offer arbitration by the State board of arbitration or by any other method that may be agreed upon. For the purpose of arbitration the labor commission and the judge of the circuit court of the county in which the trouble exists shall constitute the State board of arbitration, as distinguished from the labor commission, to which may be added, if so desired, two other members, one to be named by the employer and the other to be named by the employees.

"The agreement to enter into arbitration shall be in writing and shall state the issue to be decided, and shall have the effect of an agreement by the parties to abide by and perform the conditions of the award. Such agreement to arbitrate may be signed by the employer as an individual, or by a firm or a corporation, as the case may be.

"On the part of the employees concerned in the controversy, if any of them shall be members of any labor union or workmen's society, they may be represented in the execution of such arbitration agreement by officers or committeemen of the union or society, designated by it in any manner conformable to its usual methods of transacting such business.

"The sittings of the arbitrators shall be in the court room of the circuit court or such other place as shall be provided by the county commissioners. The circuit judge shall be the presiding member of the board. He shall have power to administer oaths, to enforce order, and direct and control examinations. The proceedings shall be informal in character, but in general accordance with the practice governing the circuit court in the trial of civil cases. The arbitrators shall make their award in writing and deliver the same to the clerk of the circuit court. The clerk of the court shall record the papers delivered to him in the order book of the circuit court. Any party to the arbitration may present to the circuit court a verified petition showing that the award has not been complied with and stating by who and in what respect it has been disobeyed. Thereupon the court shall grant a rule against the party so charged to show cause within 5 days why the award has not been obeyed, which shall be served by the sheriff as other process is. The judge shall hear and determine the questions presented and make such order as shall give just effect to the award. Disobedience of any award so made shall be deemed a contempt of court and may be punished accordingly. The award shall be regarded as binding upon the employer and the employees who are parties to the controversy.

"In addition to the foregoing, the law provides that any employer and his employees between whom differences exist which have not resulted in a strike may apply to the labor commission as such for arbitration; and the board of arbitration shall be organized and award rendered and enforced in the same manner as under the provisions just stated.

"In all cases requiring the attendance of the judge such duty shall have precedence over any other business pending in his court. In case the judge of a circuit court is engaged in a trial which can not be interrupted under the law, or is disabled from acting from sickness or other cause, it shall be the duty of the judge to appoint some other judge, and such appointed judge shall have the same power and perform the same duties as are vested in the circuit-court judge.

"It will be noticed that the foregoing law does not provide for enforced arbitration. It seems reasonable to conclude, however, that the time is rapidly approaching, if, indeed, it is not already here, when this further step must be taken under some circumstances to complete the essential processes for settling differences between capital and labor. The evil effect of strikes is not confined to employers and employees. Its influence is largely measured by the extent and character of the industry involved. A strike in a single factory will not jeopardize the public welfare to the same extent that one would on a street-car line in a populous city or on an extended railroad system, and therefore an enforced arbitration would not be as essential for the conservation of the public weal in an ordinary factory as in an extended carrying system. Strikes and lockouts involving or largely affecting urban or interurban passenger traffic cause inconveniences and losses that frequently culminate in necessity for repression by force. The instrumentality usually employed has been the constabulary or militia. The establishment by the State of a board of arbitration, which must be appealed to when the public weal is the paramount issue and in cases where there is a failure of settlement or a refusal to attempt it, is a crying need of the times, in my opinion. When we consider the large interests involved in the industries connected with interstate commerce and the disastrous consequences which follow interruption in business caused by labor disturbances, the urgency for a court of arbitration—a national court of arbitration—becomes more appar-

ent. Of course, such a board, having authority affecting interstate commerce, would derive all its powers from and exercise them in obedience to the authority of the Federal Government. The mere establishment of such a tribunal, with power to act when so petitioned, would not fully meet the necessities which sometimes arise in such controversies. It frequently occurs in these disturbances that the injuries sustained by the public are greatly more grievous than those of either contestant, or both contestants, for that matter. This situation has several times occurred in railroad strikes, and the consequences are only measured by the extent, duration, and intensity of the contest. Those with experience or reliable observation know the rule is that as they progress it is with an ever-increasing intensity; both sides become deaf to reason and refuse to yield, compromise, or arbitrate. Meantime the helpless public must drift defenselessly along, suffer from evil for which it is in no way responsible and from which there is no relief until the combatants are either coerced by force or have spent their ill-directed strength and by sheer exhaustion are forced to quit the fight.

"In conclusion, the following provisions, taken from a bill which will probably be submitted at the next session of the Ohio legislature, meet all the essential requisites of a law providing for enforced arbitration. It ought to be a national law:

"Whenever, in the unanimous judgment of the State board, a strike or lockout is not within reach of present adjustment and seriously menaces the public peace or endangers life or property, or if the situation caused by such strike or lockout be such, in the opinion of the governor, as to justify the calling out of the militia or a part thereof, or if the same has been called out because of such strike or lockout, the board shall cause the facts to be entered upon its minutes, and thereupon, on notice and hearing, make and enter therein such recommendation to the parties to such strike or lockout looking to the suspension thereof for a period not exceeding a certain number of days pending the adjustment or arbitration and the better assurance of the public tranquillity and the protection of life and property as it may deem practicable and wise. A copy of such minutes embodying such recommendations, which shall be subject to modification or renewal, shall thereupon without delay be served upon each party personally or through his agent or attorney, and it shall be the duty of said parties to comply with the same. On failure of compliance, the board shall communicate the fact to the prosecuting attorney of the county where such strike or lockout exists, or to the attorney-general, who shall forthwith make application to the court of common pleas of such county if in session, or a judge thereof if not in session, for an order to enforce such recommendation; shall cause summary notice to be served as aforesaid upon each party to appear forthwith before such court or judge and show cause why such order should not be made. Said court or judge shall immediately hear such application and make an order for the carrying out of such recommendations, with such modification thereof, if any, as may appear to be just and proper and promotive of public peace and safety. Such order shall be subject to modification on notice as aforesaid to the parties, and any disobedience thereof or interference with its execution shall be summarily dealt with and punished as for contempt: *Provided*, Said board, through any of its members, may make or join in such application. All costs incurred in the hearing of such application shall be paid by the county or counties aforesaid, as the court may direct."

Q. (By Mr. FARQUHAR.) Is the section you have just read from the proposed Ohio law?—A. Yes. I understood from Mr. Bishop, the secretary of the board, that it would be introduced at the next session.

Q. In calling the attention of the commission to this section of that proposed law, do you indorse its provisions?—A. Substantially, I do; yes.

Q. What are your practical reasons for seeking to put a law on the statute books of Indiana that comes very near the line of enforced arbitration?—A. Safety of property and of life and the preservation of peace. We have lost a good deal of property in Indiana by strikes and lost some lives, and have had the peace of the State very greatly disturbed by them when enforced arbitration could have prevented it.

Q. Is it your experience, as well as the teaching of that experience, that your laws are to-day a dead letter, keeping either the employers or the employees in a state of public turmoil?—A. Yes.

Q. Do you know of any State law that can repress two combatants if they are determined to carry out their purposes?—A. Not anything except the use of force as indicated in my paper—the feature of the militia—and that is not only more expensive but more harmful than enforced arbitration would be under certain circumstances.

Q. Have you had any occasion of late years to call out the militia in Indiana?—A. Not since the Indiana labor commission has been established, but frequently, antedating that, we had.

Q. In what class of labor did these troubles occur?—A. Among the railroad men and miners chiefly.

Q. Do both those classes, the miners and the railroad men, now provide in other ways for the settlement of their disputes?—A. By arbitration through their organizations largely. But within recent time we have had trouble even with the miners, where the employers have refused absolutely to arbitrate or negotiate with them. At Evansville 8 men were shot in one instance by somebody—it was not proven by whom—in a labor trouble where arbitration was offered in every form by the workmen and was refused by the employers. They refused even to entertain the proposition. We went down there four different times and carried a proposition to the employers asking them to submit their case to arbitration. They would not do that, nor would they submit to conciliation nor even meet the committees. As a result, one night there were 8 persons shot, some of them very painfully.

Q. (By Mr. PHILLIPS.) Were they men who were imported there?—A. They were men who were brought in from Kentucky.

Q. (By Mr. C. J. HARRIS.) Who shot them?—A. It was never proven. It was alleged that the miners did, but the miners protested that they did not, and had issued instructions, I understand—I know, in fact—not to engage in violence. One or two of the miners were arrested, but they were not proven guilty. It was a gross infraction of the law, and life and property were jeopardized; and if we had had a law that would enforce arbitration, to be used only in exceptional cases, that would have been obviated.

Q. (By Mr. FARQUHAR.) How does that section of that law operate which says that the parties to the strike shall remain at work while the arbitration is being carried on?—A. That is not a provision under our law, but an agreement between the employers' and employees' organizations.

Q. Through the national agreement?—A. Yes; or State agreement. For instance, our miners have an agreement—and some other employments as well—that where a difference arises the matter shall be arbitrated, but the men shall not quit work. Then representatives from the miners and representatives from the employers meet and settle their difficulties by arbitration. Perhaps it might be more strictly called in that case conciliation; but the agreement is made and recorded by the secretary of both parties represented, and the men continue at work and obey the findings of the board of arbitration. It is so among the steel workers in Indiana; it is so among the glass workers. We have a great many industries now that are thoroughly organized, with large, strong organizations, that adopt that method. And I may say here that most of the trouble we have in the State of Indiana is either with unorganized labor or newly organized labor. Our older and stronger organizations are more conservative, and settle their matters by arbitration or conciliation generally. Most of the labor troubles we have in Indiana are with unorganized workmen, or men newly organized, not disciplined nor educated along the line of organization. I think I could say that it is 80 per cent; I think my records will show that.

Q. Have you any record of the strikes in the State and their settlement?—A. Yes.

Q. Are more strikes settled by trade arbitration, without calling in your board, than by your board independent of the trade arbitration? I desire to get at an answer as to the utility of your State board.—A. In some industries we are never called in. The law requires us to go there and investigate and offer our assistance; but among the glass workers, while we have always been received kindly, we have never found it necessary, except in one or two instances, to interfere. We have made two settlements, I think, among the organized glass blowers. Perhaps in the past 8 years we have made a dozen among the miners. We are frequently called among the miners, notwithstanding that they have both a State and national method of settling their differences. The iron and steel workers perhaps twice.

Q. The molders and machinists?—A. Never the machinists; the molders once or twice. In all other instances they have settled their own differences, and they report the facts to us, and we report them to the governor. Our largest efficiency—if you will allow the use of the word efficiency—is among the newly organized and the unorganized workmen.

Q. Then you see a positive necessity for the State of Indiana to maintain a State board?—A. I do; yes.

Q. More in the line of mediation than immediate arbitration?—A. Mediation largely, with rarely arbitration.

Q. You say the older organizations of the workmen, the trades unions of that State, have their own trade agreements and their own arbitration?—A. Yes.

Q. What is your opinion of that class of arbitration as distinguished from State arbitration?—A. I think it is the best method for settling difficulties between employer and employees. I think it is the most satisfactory.

Q. Have the trades or the organized bodies of Indiana much faith in your State board?—A. I have never heard any opposition to it.

Q. Have you been subject to any criticism at all about its efficiency and its means of settlement?—A. None that I know of. It was created at the request of organized labor in Indiana.

Q. Do you have any means to compel, in case one party to the arbitration proceeding does not carry out the stipulations of the agreement?—A. Yes. I was going to state that the decision of the arbitration board is made a matter of court record on the order book of the county where the arbitration takes place; and in the event of the violation of it by either side the judge of the court, who is the third member of that board of arbitration, deals with it as he would with any other case of contempt of court.

Q. (By Mr. LITCHMAN.) In that case it becomes compulsory arbitration?—A. Not compulsory arbitration, but compulsory obedience to the decision of the board of arbitration.

Q. I want you to make that point a little clearer, if you will.—A. I will explain. For instance, parties can enter voluntarily into the arbitration under the arbitration board of Indiana, which consists, as the paper said, of a judge of the circuit court and the labor commission. Then, when the finding is made and made a matter of court record, obedience to the provisions of the findings of that board is mandatory.

Q. Having applied to your board to act as a board of arbitration they are bound under penalty of contempt of court to abide by the decision of the arbitrator?—A. Yes; that is the law.

Q. (By Mr. C. J. HARRIS.) Have you any instance in your mind of such an arbitration where you were able to compel men to work if they did not choose to?—A. We have never had a case of that kind in Indiana.

Q. Has the court ever imprisoned men for contempt of court or anything in that line?—A. There has never been a violation in a case of that kind. I would have known of it if there had been. There has never been a violation of the finding of the State board.

Q. On the part of employers or employees?—A. On either side—no violation.

Q. (By Mr. FARQUHAR.) In the stipulations of this agreement, suppose it is in the matter of hours of labor, and the decree of the court is that the hours shall be shortened half an hour in the day or an hour in the day, what is the usual length of time which that stipulation covers?—A. Usually for 1 year. The findings are usually for 1 year. The statutes of Indiana make the 8-hour workday the legal workday for all kinds of labor except domestic and farm labor.

Q. Has that law ever been tested in the courts?—A. No; it has never been tested. I do not say it is universally observed.

Q. Do you regard it as class legislation?—A. I am afraid I would have to put that interpretation on it.

Q. Would it not stand on all fours with the Nebraska decision—the exception of domestic and agricultural labor?—A. I do not think it would, under our constitution. I am sorry. I would like to have it made universal, frankly.

Q. Then you have a particular law in Indiana making 8 hours a working day?—A. Yes; I made a settlement on that basis day before yesterday.

Q. In the case of wages, suppose that they should enter into a stipulation which is included in the decree, and you found a competitive district south or west or east or north of you which made the decree unjust toward the employer in the general competitive market having the same class of goods, would that be an annual agreement, too?—A. We have never had a case of that kind. But the question of the competitive feature ought to be taken into consideration at the time. Up to this time we have never made, and I do not think would make, an agreement or a finding for more than a year. I do not think it would be wise to do it. All that we ever have made have run for a year. Most of our settlements are along the line of conciliation and not by arbitration.

Q. Why is it that you desire a law for the State of Indiana built something on the plan of the proposed Ohio law, when you have now a law which gives you almost enforced arbitration without friction?—A. Our law does not give us enforced arbitration; our law only gives the power to enforce the decision of the court after it has been made. But there are cases, or have been cases in Indiana, where the military had to be used where enforced arbitration would have accom-

plished the same object with less friction, less expense, and with more satisfaction to both parties, in my judgment. I could cite instances where I am satisfied that enforced arbitration would have been a better method of settlement. The use of brute force is objectionable. That is the thing I want to obviate.

Q. Can you bring both parties before your board when one party will not agree to come before you?—A. No; purely voluntary.

Q. You must have an agreement with both parties before it can come before the court?—A. Yes; it has to be purely voluntary.

Q. Have you any machinery at all to bring a party before the court in case of a strike, infraction of the public peace, or destruction of property?—A. We have not under the law governing the labor commission; we have no authority of that kind.

Q. Do you think the proposed amendment to the Ohio law would give you that?—A. It looks that way to me.

Q. Do you think that enforced arbitration of that character is as good for both parties and for the State as the adoption generally, if it can be, of trade arbitration and mediation by the trade?—A. I would rather have trade mediation, but there are cases where such a method as that is not enforceable, because the men are not organized and have no method or machinery to carry it out.

Q. (By Mr. LITCHMAN.) Even with the strong labor organizations, if the employer refused your mediation and conciliation, you would still be short of the arbitration of differences?—A. As the matter now stands we would.

Q. Under your plan, application having been made to your board jointly, as I take it, by the employer and employees, to submit the difficulty for arbitration, by that application they thereby virtually bind themselves to abide by the decision?—A. Yes; that is the law.

Q. And then, having voluntarily entered upon the arbitration, it becomes compulsory to the extent of their being bound by the decision made by your board?—A. Perhaps I ought to correct that impression. Parties can make application to arbitrate under the Indiana labor commission and then withdraw that application.

They have that power.

Q. At what point?—A. Before the decision is rendered. When a decision is rendered and made a matter of court record, it then has a binding force, but not before that.

Q. As a matter of fact, have you had cases where the decision by your board has been made a matter of court record?—A. Yes.

Q. In all cases it has been obeyed cheerfully on both sides?—A. In all cases it has been obeyed strictly and fairly.

Q. And has it seemed to meet the wishes of both sides, so far as you are able to judge?—A. So far as my observation extends, it has. We are sent for every year in one or two factories to settle their troubles and make their contract for the ensuing year. There is one factory in particular that has sent for us for three consecutive years to assist in adjusting their wage matters and entering into a contract for a year, and the decision is placed on the court record and they obey it.

Q. And your experience has been then that arbitration is growing more popular both with the employer and employee?—A. And the employee, yes. The fact that a great many of the stronger and older trades use the method of arbitration in settlement of difficulty, rather than resort to strikes, proves that incontestably.

Q. It is an educational process by reason of their example?—A. Yes; and it is advocated by many leading workmen in Indiana. I know that a year ago I was addressing an assembly of workmen, and I was making the point that we ought to have more general arbitration, etc., and I went on discussing the matter in a particular feature of my address for about 15 minutes, and they applauded almost every sentence, and they were representative workmen and women of the State—showing to me conclusively that the sentiment is growing stronger. This was at the session of the State federation at Elwood.

Q. (By Mr. FARQUHAR.) Do the employers accept arbitration as readily as the employees?—A. I think not. I think the employers prefer conciliation as a general thing.

Q. Have you any trouble on the part of employers there not recognizing organized labor, or the so-called unions?—A. Very little. We did have, at the early stages of the organization of the miners, considerable trouble, a great many strikes and infractions of the law, but now that entire industry in Indiana is organized. We have once in a while objection offered to the recognition of organized labor, but it is growing more general as the organizations grow strong and more conservative. The element of conservatism gives it a stronger standing.

Q. (By Mr. A. L. HARRIS.) What effect, if any, in bringing about voluntary arbitration, would such an amendment or law as you propose have?—A. The law

ought to be so qualified as to make its application useful only in extreme cases. I do not think it would have any effect on ordinary arbitration or conciliation.

Q. What I desired to bring out was your opinion as to whether or not it would not be conducive to voluntary arbitration in cases where both sides now stand out refusing to accept the help of your board?—A. Yes; where the alternative would be compulsory arbitration or willingness to voluntarily accept some other means of arbitration, I think it would be conducive to good results.

Q. You think the more drastic the law the more helpful it would be toward voluntary arbitration?—A. I am not positive. It ought not to be too drastic, but I think it ought to be drastic enough to meet all the extreme emergencies that would come up.

Q. Have you experienced this trouble in any case where you have gone voluntarily on the ground; where both parties stand out on a pride of position, and both sides really are anxious that some terms of settlement be agreed upon, and each is too proud to commence it?—A. A number of instances of that kind, where they have expressed the feeling after the matter had been settled—at the time they thanked us for coming in—but they did not feel as though they wanted to take the matter up themselves; they thanked us as representatives of the State for coming in and taking the matter up and settling it.

Q. (By Mr. FARQUHAR.) You gave them an opportunity for swallowing their pride?—A. Yes; gave them an opportunity for swallowing their pride. That has occurred frequently. I know of instances where they have stood apart for a week or 2 weeks and perhaps longer, and when the labor commission would go there and meet them and tell them what the commission was they would accept it, and they would get together and fix up their troubles, and both sides would thank us for it and say that they believed we had been helpful in reconciling their differences where they might otherwise have remained out longer.

Q. (By Mr. KENNEDY.) You would not expect such a State law as this to work as to any cases of trouble on interstate railroads in Indiana?—A. No; I believe the National Government ought to have a national board of arbitration and settle all such matters.

Q. Do you meet labor commissioners of other States in conventions?—A. Our commission has met the labor commission of Ohio and the labor commission of Illinois.

Q. Has any movement been started by them looking toward the formation of a national board of arbitration for this purpose?—A. None that I know of.

Q. Is there a demand on the part of organized labor for such a board?—A. No; none that I know of.

Q. You think a movement of some sort must be started, to get a national law of that kind?—A. A commission on interstate commerce ought to be established by the United States Government.

Q. (By Mr. PHILLIPS.) Interstate commerce can not reach the general industries, can it?—A. I should think not.

Q. You think it would not be constitutional to enact a general law applicable to the manufacturing establishments of the United States?—A. No; I should think not. I should think that the only competent law would be one affecting interstate commerce. Strikes on railroads are perhaps more disastrous to commerce generally and the people than any other strikes. I take the position that under certain circumstances arbitration ought to be mandatory. I think the interests of the people at large are greater than the interests of the people involved in the strikes under a great many circumstances.

Q. (By Mr. FARQUHAR.) Would that be called an advanced opinion in trade unionism?—A. I do not think it would be indorsed by trade-union men generally. It is not a new one, and I am not advancing it for the purpose of trying to gain popularity. It is conviction on my part.

Q. (By Mr. LITCHMAN.) Your idea is that there are disputes between employers and employees in which the interests of the public at large are so great that the power of the State ought to step in and compel a settlement?—A. That condition has arisen in Indiana on several occasions. When it becomes a question of the destruction of property and the destruction of life, etc., I believe then that the interests of the public at large should take precedence over the interests of the parties engaged in the contest.

Q. A difficulty that approached the proportions where the militia of the State would be called in, would be one where some sort of arbitration should be enforced between the employer and employees?—A. Yes.

Q. That would be considered, in your judgment, a grave situation?—A. A grave situation. I am aware of the fact that compulsory arbitration is not a popular idea, but then I believe in it. My observation and experience alike, running over a good many years, have convinced me that some such law as that ought to exist.

Q. Have you given thought enough to that branch of the subject to have an opinion as to whether, under circumstances like that, the refusal to arbitrate applies more to one side of the controversy than to the other?—A. My experience would not enable me to give you an intelligent idea in regard to that matter except in one instance, and there might be instances just the reverse, you know. In the one instance I refer to, where 8 men were shot down at Evansville, the employers refused to accept any kind of arbitration. The city council made a request of them and the Board of Trade of Evansville did the same thing, but they refused to accept any proposition whatever, and of course that led to a whole lot of serious trouble. In a case like that I think they ought to be required to take some step that would put a stop to it.

Q. Is that a case where the governor refused to call out the militia?—A. Yes.

Q. On that ground, was it not?—A. Yes.

Q. That they had refused to submit to arbitration and that the power of the State should not be called in?—A. Yes; that is so. Five different methods of arbitration were submitted to them, by representative business men, too, but they refused to accept any of them. The thing that was asked of them was simply to establish the same condition in their mines as was existing in other mines throughout the competitive district, and they refused to do it. Then we had a case a few weeks ago where an attempt was made to mob the superintendent of a quarry because he brought in a lot of Italians. That was in violation of the law. Our law prohibits the importation of foreigners. I could mention other instances, and I could mention instances also where the working people were engaged—

Q. (By Mr. PHILLIPS, interrupting.) You mean importation from other States or from abroad?—A. Importation of men who are not American citizens; it does not make any difference where they are from. These were foreigners, not naturalized.

Q. Your law prohibits that?—A. Yes, it prohibits that; but a man can bring labor from another State if he wants to, if they are not foreigners—if they are American citizens.

Q. (By Mr. FARQUHAR.) Have you a good deal of alien labor in Indiana?—A. A good deal of foreign but not alien labor. We have a good many foreigners. In the steel industry, the glass industry, and those industries there are a great many of foreign birth, but they are American citizens.

Q. Are there many in the skilled branches of those trades?—A. Yes; a great many tin workers and iron and steel workers are Irish and Welsh. They are skilled workers.

Q. As a trade unionist and a workingman yourself, what is your own opinion of the present restrictions of immigration? Are they severe enough and are they ample to protect the American workingman?—A. My opinion is that they are ample if they are enforced.

Q. Do you think there is a lack of enforcement?—A. I have seen cases of that.

Q. Do you lay that to the inefficiency of the present servants of the people, or the lack of servants?—A. I think it is more lack of attention to business than anything else; it seems to me that way; not a disposition to ignore or violate the law, but a lack of attention.

Q. Have you known of any cases of contract labor coming in?—A. The information I get along that line I get more from labor papers than anywhere else.

Q. (By Mr. KENNEDY.) Have you any idea that the failure of the immigration laws is in any sense due to the corrupting influence of the steamship companies?—A. Oh, I think not. I do not think there is nearly as much corruption as we hear talked about. I do not go anything on that at all.

Q. (By Mr. C. J. HARRIS.) Has there been much negro labor imported into Indiana from the South?—A. Not an excessive amount. The labor that comes from the South comes voluntarily, except in an instance or two that I referred to where there was a strike and the employers brought them in.

Q. (By Mr. LITCHMAN.) You say that your information about the nonenforcement of the alien contract law has come to you from labor sources?—A. Through labor papers that I take.

Q. Criticisms of its nonenforcement?—A. Yes.

Q. Do you take that as an evidence of the desire, at least on the part of the publishers of the papers, to have the laws strictly enforced?—A. That would be my interpretation, that the laws are not enforced as strictly as they should be in regard to the importation of alien labor.

Q. Do they specify in any way?—A. I do not know as any specific instances have come under my notice recently. I take perhaps 25 labor papers, use them in my business, and once in a while I come across a case of that kind. Of course,

I have never paid any special attention to it or made it a matter of particular note.

Q. As to the impression made on your mind, they speak of the unfair competition that follows from the importation of the labor itself?—A. The unfair conditions brought about by the importation of labor.

Q. How far does that sentiment exist, so far as your observation goes, among the labor organizations, as interpreted by the papers?—A. I do not know that I could trace it to that origin at all, and I do not know that I have had a specific instance of that kind. I have just in a general way read in the newspapers occasionally complaints about the importation of foreign labor. To tell you the truth, I do not know an instance of it except the importation of those unnaturalized Italians from Chicago to Indiana.

Q. (By Mr. KENNEDY.) What is the sentiment among labor men in Indiana on the subject of the further restriction of immigration?—A. I have heard no expression. I have attended all their conventions, but I have heard no expressions. The matter was never brought up in any convention or State federation that I attended.

Q. (By Mr. CLARKE.) You have used the expressions, which are very common in these matters, "compulsory arbitration," "enforced arbitration," and "mandatory arbitration." Do you make a distinction between those terms, or regard them as practically synonymous?—A. I used them in a synonymous sense, but there ought to be a distinction. The decision of the commission ought to be mandatory, or the arbitration board ought to have the power given to them to stop strikes under certain circumstances through the process either of the board or of the courts, so as to protect the public.

Q. What would you say to a law that would put a penalty on anybody who should inaugurate a strike or lockout without first applying for arbitration?—A. I am emphatically in favor of it and shall recommend that to our next legislature. I have the paragraph already written. I think when a controversy arises, whether a matter of interstate commerce or between employer and employee in the ordinary industries of the country, there ought to be an attempt made to conciliate or arbitrate before the strike comes. The miners do that. The glass workers in Indiana do that. They strike sometimes, but they do it in violation of their agreements.

Q. (By Mr. PHILLIPS.) What penalty would you attach?—A. I might make it a misdemeanor under the statutes of Indiana. In all controversies there ought to be an attempt made to arbitrate or conciliate before a strike.

Q. (By Mr. FARQUHAR.) You would take away the power of the union to strike?—A. No; I would add to it the duty to try to conciliate before striking.

Q. But suppose they have tried all the usual remedies—gone to the employers and they won't agree to arbitrate or mediate, is not the only remedy of the union a strike?—A. Yes, after those efforts are made. The strike then comes as a logical consequence.

Q. (By Mr. CLARKE.) If such a law as that were enacted, a penalty would be imposed on the man who should refuse to accept the offer of arbitration, and maybe that would obviate a strike, or would it?—A. I would not say that it would. I would say that it would have this effect, that it might lead to a settlement without a strike. In many instances the men simply make a demand and the employers do not see fit to accede to that demand, and the men walk out. There is no attempt made to arbitrate or conciliate the matter at all. I think that is wrong. There is not an industry in which the public is not more or less interested. For instance, we had 600 men out at Evansville in a cotton factory. They struck the 1st of July, and there was no attempt made to arbitrate or conciliate the matter for 2 months. As a result, it has just ruined the business in that end of Evansville. One or two men have taken the bankrupt law. You can see its far-reaching effect. Now, if there had been an attempt to conciliate or arbitrate that trouble before the strike occurred, perhaps it could have been done.

Q. (By Mr. LITCHMAN.) Have you seen any tendency toward a public sentiment leading up to what we might call enforced arbitration?—A. I have heard frequent expressions. There is a growing tendency.

Q. There is a crystallization of sentiment in that direction?—A. That is my experience. I do not want to deprive a workingman of the right to strike under certain circumstances.

Q. (By Mr. FARQUHAR.) Is not the right to strike a divine right?—A. I am not ready to say it is a divine right, unless as self-defense is. I have struck, and there are lots of cases where men are compelled to strike; but I have always been opposed to a strike until all efforts at conciliation had failed. Now, if an employer

and his men come together and make an honest attempt, and if their differences are so great that they can not reconcile them, a different proposition comes in.

Q. (By Mr. A. L. HARRIS.) Do you look on the strike as an act of war?—A. I would so regard it in a small way.

Q. A breach of the peace against the dignity of the State?—A. I would consider it more as a practical proposition—a business proposition.

Q. I want to get at the foundation for making it a misdemeanor.—A. That is true. I catch your idea. All strikes practically lead along the line of a breach of the peace.

Q. (By Mr. PHILLIPS.) How about a lockout?—A. The same thing.

Q. (By Mr. CLARKE.) Do you not think a great public sentiment has already developed in favor of preventing such things, if possible, by means of peaceable and legal means?—A. Yes. There is in Indiana a very strong sentiment in favor of obviating the strike the best we can.

Q. (By Mr. C. J. HARRIS.) You can compel the employers through compulsory arbitration to do this, that, and the other thing; they are incorporated and they have property, but how are you going to compel the workmen to do anything?—A. Make their violation of it a misdemeanor. Our law does that.

Q. How if they choose to move away—if they are sick?—A. If they move away, they get out of the jurisdiction of the court then.

Q. Is not this compulsory arbitration a little one-sided, in other words?—A. No, I think not.

Q. Then what method have you for compelling the employees to carry out your decisions?—A. In Indiana it is a contempt of court—a refusal to do so.

Q. How punished?—A. By fine.

Q. But if you can not imprison them and they have not money to pay the fine?—A. We can imprison them in Indiana for contumacious contempt of court.

Q. I understood you to say they have not done that?—A. It has never been done—no occasion for it.

Q. (By Mr. KENNEDY.) Would not the success of compulsory arbitration in New Zealand be an answer to the question?—A. I think the conditions there are not the conditions in this country. Their method is very excellent, but would not apply in this country.

Q. (By Mr. C. J. HARRIS.) Suppose a man has a factory that he is running without any profit, as is very frequently the case, if you will look at the records. Suppose the employees demand 10 per cent more wages and your arbitration board gives them that 10 per cent more wages. Are you going to compel that factory to run and employ those men at 10 per cent advance? Will the courts compel him to run his factory and pay 10 per cent more wages?—A. If he enters into an agreement to abide by the decision of the board of arbitration, he is as much bound as if there had been a reduction of 10 per cent on the part of the workmen.

Q. On the other hand, if he refuses to arbitrate you get him for a misdemeanor in that way?—A. No.

Q. I understand that you favor a law that any man who refuses to arbitrate shall be subject to a fine and penalties?—A. No; I have not so stated it at all. My position is that there ought always to be an attempt at conciliation and arbitration. In every controversy there ought to be an attempt. If they disagree, they disagree; but the attempt ought to be made, because in many instances an agreement will be reached before a strike. I have known of a number of difficulties between employers and employees being settled in that way. Either one or the other said, "If I had understood it that way, there would have been no trouble." I had 8 instances in 1 month in which that expression was made: "If we had understood that, it would have been all right. Draw up your articles and we will agree to it. That is all right."

Q. (By Mr. PHILLIPS.) You said you had a paragraph written along that line, requiring arbitration before a strike or lockout was inaugurated. What is the provision of that law that you propose, if either party refuses?—A. I have suggested to the governor of Indiana that the legislature ought to pass a law (my reports are made to the governor and not to the legislature) requiring an attempt at conciliation or arbitration, under all circumstances and in every controversy, before a strike or lockout.

Q. Without any penalty?—A. I think there ought to be a penalty where they absolutely refuse to make an attempt to settle, for the protection of the public.

Q. (By Mr. CLARKE.) Do you not think a distinction fairly exists between an ordinary closing of business and a lockout? A man may close his business for personal reasons—because he has become too old, or because his business does not pay, or because he wishes to remove to another place; but a lockout occurs where

a controversy exists between a man and his help, and he closes down as a means of coercing the help.—A. There is that distinction.

Q. You would not put a penalty on a man for an ordinary closing down of business for personal and good reasons, but only when it is distinctly a lockout?—A. I should not think that a man should be fined for withdrawing from business, but I do think, as I said a while ago, that when these controversies come up the law ought to require them to try by some method to settle the difficulty before either one resorts to the drastic measure of the strike or lockout. I do not say that the law ought to require them to settle that difficulty, but simply to attempt to settle it; because my own experience leads me to know that in many instances strikes and lockouts would not occur if a fair and conservative effort was made to get together and discuss differences, or apparent differences, for many times they are merely apparent when you get down to them.

Q. (By Mr. C. J. HARRIS.) If you say they should be compelled to arbitrate under the penalty of the law, and then they should be compelled to carry out whatever that arbitration calls for under penalty of the law, you would put any man who was in any sort of business in a rather peculiar position.—A. I would not indorse that position. Let me give you an instance which this brings to mind: I know a place where a man employed 110 men; they went out on strike. He had issued an order in regard to, I think, 16 of his men—not discharging them, but requiring them to perform certain tasks before they should get their full pay. They were out 10 days. I went down there, and after 8 or 4 days I got the employer and a committee of the men together, and he made an explanation of why he issued that order. They said, "We did not understand that; we did not understand that was the proposition at all. We did not know that the relationship between you and these 16 men was such as it was. If that is the situation, we will declare this strike off." They declared it off; but in the meantime he had lost 3 very important contracts with patrons for furnishing coal just because a lot of men did not understand the purpose of an order that he had issued. Now, if we had had a law in Indiana compelling the men to send a committee and talk with the employer and have an explanation made, he would have been saved those contracts and they would have saved the 10 or 12 days' wages, and there would have been no disturbance at all. Lots of these instances occur through a misapprehension.

Q. (By Mr. CLARKE.) I have understood you to say that the public has a large interest in labor controversies, because the public is sometimes even more injured by them than the parties. That being the case, ought not the public to have some means of preventing these difficulties; and what better means can you think of than a law that shall require both parties to offer and accept an arbitration?—A. Well, that practically is my proposition. It leads to the same result.

Q. If they are merely required to make explanations to each other and be gentlemanly—while that might sometimes end the controversy, would that really apply a remedy in many cases?—A. In many cases it would not. In many cases I do not think the interests of the public are paramount to the interests of the people involved. But in cases of interstate commerce, and where violation of the law is likely to ensue and property likely to be sacrificed, then I think there ought to be a power vested somewhere higher than the combatants themselves, and I think that should be in the courts or the board of arbitration.

Q. Obviously an objection to a law of that kind will be based largely on the ground of private right—a man's right to run his business as he may please. Now, if the public has a paramount interest, it must put that into some form of law that will be compulsory.—A. That is my proposition.

Q. You see no other way, then, than to have the law provide a penalty for whoever shall inaugurate a strike or lockout without first offering or accepting an offer of arbitration?—A. Offering arbitration, or at least agreeing to attempt it.

Q. (By Mr. FARQUHAR.) You say most of your strikes come from the skilled-labor class?—A. Yes.

Q. Is the simple fact of organization an irritation to the employer, in the majority of instances?—A. No.

Q. Do you find a cooperation on the part of the employers and organized labor?—A. It is becoming stronger and stronger. I have had employers in the last few months say they would not use nonunion labor. They say they make their contracts annually at a given time with their men, and they have 804 days then to attend to business. They have settled the wage question and working conditions, and after that these controversies do not come up.

I have in mind a man that perhaps has more money invested in mining industries in Indiana than any 3 other men in the State. He used to work nonunion miners, and he told me in the State house, possibly 8 months ago, that he had tried

both. First, I will say, he had trouble with his men. They were unorganized. I went to him and asked if he would not arbitrate the differences. He said, no, he did not care to; he did not care to work union men. It drifted along, and finally he did come to an agreement partially through the assistance of the Indiana labor commission. I met him less than a year ago and he told me that as long as he stayed in business he proposed to work union miners, because at the last of April every year he met his men; that they have an association in Indiana, and they met every year and fixed up their wage scale and working conditions and discussed all these craft questions, and that ended it for the year. He said, "All the rest of the year I attend to business, to selling my product."

Q. (By Mr. PHILLIPS.) He knows on what terms to contract?—A. That is the idea, exactly. He knows on what terms to contract.

Q. (By Mr. A. L. HARRIS.) And he knows the other contractors are contracting under the same conditions?—A. That is true. It brings about uniformity of conditions.

Q. (By Mr. LITCHMAN. If there was legislation that gave to your board (applying to your own State) the right in case of a difficulty between employers and employed to summon before the board the representatives of the 2 parties to the controversy, thereby giving to you the opportunity to investigate as to the rights and the wrongs of the case, and then you publish an impartial decision as to your findings, would not that give either side that was decided to be in the right of the controversy the very powerful assistance of public sentiment to force a settlement of that difficulty?—A. I think it would in the main have that effect. Our law does not allow us and we never do publish the merits of these controversies. Under our law it is now referred to the governor and he, if he sees fit, gives the facts to the public. We never do.

Q. The point I wish to emphasize is that one of the great controlling influences in the settlement of all trade difficulties has been public sentiment.—A. It is possibly the most potential factor in the controversy.

Q. That has been exemplified in this case of the anthracite coal strike. The sentiment of the public was unanimously with the men in that difficulty. Now, my point is to reach a declaration of that sentiment at the earliest possible moment, and especially in difficulties where the public is so vitally interested as it was in the anthracite strike and the Chicago strike and in the building strike in Chicago.—A. I think it would have a helpful influence in repressing the difficulties that crop out, and it would have the effect of bringing together the employers and the workingmen and settling the matter for fear of having it published. I believe that.

Q. (By Mr. C. J. HARRIS.) Do you find that either the workingmen as a class or the employers as a class are in favor of compulsory arbitration?—A. No; I have not so found it. I believe really it would be unpopular with the majority.

Q. (By Mr. KENNEDY.) Are the workingmen of Indiana satisfied with the present method of employing the convict labor of the State?—A. The method now in vogue is satisfactory. The last legislature put it practically on the State-account system.

Q. The product then goes out on the market?—A. It does, but we have restricted the product. We have begun a system that will lead up to the State-account system.

Q. The State-use system, you mean?—A. Like New York. It does not go as far as New York does now, but the intention is that by this method we will accumulate \$25,000 a year for 5 years. That will be used then to buy the machinery that belongs now to contractors, and it will then be owned by the State. Besides that, we have restricted the number of men that any one contractor shall have to between 50 and 100—not to exceed 100 to any man. Then we have restricted the sort of industries that shall be represented in the penitentiary. That surplus labor—the labor that men usually do not want to contract for—we have provided to utilize by purchasing a piece of land outside of the prison. That is, put the trustees and the old lifers that you can depend on out in a garden patch, and they raise turnips and potatoes and everything else of that kind, and that goes to the prison, and the surplus can be sold in the market of Chicago, which is convenient, or be sent around to the other institutions of the State. I am referring now to the Northern Penitentiary at Michigan City. In that way we have very materially decreased the output from the contractors.

Q. You say your law looks to the elimination of the contractor?—A. Yes; within 5 years.

Q. And at the end of that time the product of the convict labor will be used only for State purposes?—A. And we propose to eliminate as much as possible the machinery used, and have the men do the work by hand. Then when a released

prisoner goes out to compete with the world he will have a skilled trade. It will make a better man of him.

Q. In 5 years you will have the new system?—A. If the legislature does not change the method we have adopted.

Q. When was the law passed?—A. Last legislature—2 years ago. That is all the result of organized labor, too.

Mr. PHILLIPS. Perhaps we have not covered everything, and if you have anything to volunteer we would be glad to hear you.

The WITNESS. I do not know that I have anything to suggest further than we have already discussed. I still maintain I am in favor of enforced arbitration under certain circumstances. It is unpopular, but I believe in it.

This commission is doing a glorious work. I was saying to some gentlemen in Indianapolis that the Industrial Commission was doing more for the working people generally and for the public at large than any commission which Congress has established for a long time.

(Testimony closed.)

WASHINGTON, D. C., November 14, 1900.

TESTIMONY OF HON. THOMAS P. RIXEY,

Commissioner of Labor Statistics and Inspection of Missouri.

The commission met at 10.50 a.m., Vice-Chairman Phillips presiding. At that time Hon. Thomas P. Rixey appeared as a witness, and, being first duly sworn, testified as follows:

Q. (By Mr. LITCHMAN.) Kindly state your name, post-office address, and your official position.—A. My name is Thomas P. Rixey, Jefferson City, Mo.; commissioner of labor statistics and inspection of Missouri.

Q. What is your profession aside from your official position?—A. I was in the insurance business 12 years prior to the time I was appointed labor commissioner. My profession really until my health broke down was law.

Q. Will you kindly state the duties of the office?—A. The duties of my office are to give such information as I may think best for the interests of the people in regard to all mechanical, agricultural, mineral, educational, labor, and other interests of the State. They cover all the interests of the State. They are not confined, as in some cities, just to labor matters and labor conditions that affect labor only, but they cover all the material interests of the State. It is also my duty to inspect sweat shops, manufactories, and places which the law makes it necessary to be inspected.

Q. Do you have assistants; and if so, how many?—A. In connection with this office the last legislature passed a bill creating what are known as State free employment bureaus in cities of 100,000 inhabitants and over. That necessitated the opening of an office in St. Louis and Kansas City, they being at that time the only two cities in the State that were entitled to the benefits of this law. St. Joe, I believe, will come in under the last census. I opened two offices, one in St. Louis and one in Kansas City, with a superintendent and clerk in each. At Jefferson City, which is the headquarters of my department, I have a chief clerk and stenographer. I have had two special inspectors or men to gather statistics and such information as is necessary for me to embody in my annual report to the governor. They go to different parts of the State as special agents of the labor commission to gather such information as I could not otherwise obtain. I print in connection with my report what is called a surplus-production map, which shows the surplus production of our State—where that surplus production may be. I gather this information from reports from agents of railroads and from steamship lines in my State, and where I am unable to obtain that information in this way, as we have several counties in which there are no railroads or steamship lines, I send special agents there for the purpose of obtaining that information.

Q. I wanted to learn whether you have, the same as in other States, a corps of factory inspectors.—A. No. In 1892 the legislature of Missouri passed a bill making it the duty of the city authorities of all cities of 5,000 population and over to appoint a factory inspector and also provide for their compensation.

Q. What are the duties, briefly stated?—A. The duties of those factory inspectors are to inspect under the law all manufactories, sweat shops, and places where 5 or more people are engaged at work.

Q. As to sanitary conditions, etc.?—A. Yes; also as to conditions in regard to safety, and also as to separate toilet rooms where male and female employees work, and those conditions which are usually provided for under legislation.

Q. The duties of your office, then, give to you a general knowledge of industrial conditions in your State?—A. Yes; that is my duty. While we have no State factory inspectors, we have this provision that I may appoint—you might say they are not factory inspectors really, but deputy labor commissioners under me. There is no such office in Missouri as State factory inspector.

Q. Do the duties of your office include the knowledge of strikes and labor disturbances?—A. Yes; we have a law which I will read to you. It is a brief one and also a very poor one. It is so ineffective that in fact I did not invoke it in the case of the street-car strike in St. Louis because there is nothing compulsory or mandatory in it. Here is the law of the State of Missouri on the subject of strikes and arbitration:

(Reading.) "Section 8137. Dispute between employer and employee, etc. Upon information furnished by an employer of laborers, or by a committee of employees, or from any other reliable source that a dispute has arisen between employer and employees, which dispute may result in a strike or lockout, the commissioner of labor statistics and inspection shall at once visit the place of dispute and seek to mediate between the parties, if in his discretion it is necessary so to do. (R. S., 1889, sec. 6354.)

"Section 8138. Board of arbitration formed; when. If a mediation can not be effected, the commissioner may, at his discretion, direct the formation of a board of arbitration, to be composed of 2 employers and 2 employees engaged in a similar occupation to the one in which the dispute exists, but who are not parties to the dispute, and the commissioner of labor statistics and inspection, who shall be president of the board. (R. S., 1889, sec. 6355.)

"Section 8139. Power and duties of board. The board shall have power to summon and examine and hear the matter in dispute, and, within 3 days after the investigation, render a decision thereon, which shall be published, the copy of which shall be furnished each party in dispute, and shall be final, unless objections are made by either party within 5 days thereafter: *Provided*, That the only effect of the investigation herein provided for shall be to give the facts leading to such dispute to the public through an unbiased channel. (R. S., 1889, sec. 6356.)

"Section 8140. Board not to be formed; when. In no case shall a board of arbitration be formed when work has been discontinued, either by action of the employer or the employees: should, however, a lockout or strike have occurred before the commissioner of labor statistics could be notified, he may order the formation of a board of arbitration upon resumption of work. (R. S., 1889, sec. 6357.)

"Section 8141. Board to appoint a clerk; compensation. The board of arbitration shall appoint a clerk at each session of the board, who shall receive \$3 per day for his services, to be paid, upon approval by the commissioner of labor statistics, out of the fund appropriated for expenses of the bureau of labor statistics. (R. S., 1889, sec. 6358.)"

Now that is all the law we have on arbitration in our State.

Q. How long have you been in office?—A. Two years next February. I succeeded Mr. Roselle.

Q. During that time have any labor troubles involving the question of arbitration come under your observation?—A. Yes. The most serious was that of the street-car strike which commenced May 7 of this year and continued for 55 days.

Q. Will you kindly give the commission the outline of that difficulty, and how far you were brought into personal connection and knowledge of it, and your conclusions concerning it?—A. At the last session of our legislature, which was winter before last, a bill was passed by the legislature giving to certain independent lines of street railroad in the city of St. Louis the right to consolidate. They formed a consolidation in May following that—after the legislature. There was a demand made by certain employees of what is known as the Transit Street Car Company—which was a consolidation of several independent lines which had been running in the city—there was a demand made from them for shorter hours of labor, and also in regard to the employment of men who belonged to what was called the Amalgamated Association of Street Car Employees of America. They organized in the city of St. Louis. There was a union formed in the city of St. Louis among the employees of the transit company, and also partially of the employees of another company, known as the Suburban Street Car Company—St. Louis and Suburban, it is called. There was a strike of some few days on the Suburban, but that was settled without any serious trouble. But the employees of what was called the St. Louis Transit Company struck May 7, and there was

not a car run on the various lines, which cover some 400 miles of street-car lines in the city of St. Louis, for 12 days.

Q. (By Mr. PHILLIPS.) You might state at that point how that affected retail business.—A. It affected it to the extent that the whole city was terrorized to a certain extent. Women were afraid to attempt—even when the cars began to run after the 12 days—were afraid to get upon the cars to go shopping. Business men were afraid to take the car. There was hardly a day or hour in the day that the cars were running that some one was not injured, and a number of people were killed. It resulted in the swearing in of an additional number of policemen in the city of St. Louis. Even that was not sufficient. The power of the sheriff was invoked to swear in deputies, and he swore in what was termed the posse commitatus. That posse commitatus, being under the control and direction of the sheriff and the chief of police, patrolled the city. In the meantime the transit company, being compelled under its charter to run its cars, sent agents to every city, I presume, where they thought they could find persons that would come and take the place of those men who would not work, and some that were afraid to work on account of the feeling about the union—on account of the methods that were used to prevent the car lines from running. Dynamite was used on the cars and the cars were wrecked. Men were shot at and stoned as they rode upon the street cars along the streets for 55 days.

Q. Were there any women badly mistreated in that time?—A. Yes; some women were very badly mistreated. One of the most flagrant cases committed was where a mob stripped a woman of nearly all her clothing, and she was left naked in the street, because she rode on one of those cars during the time of the strike.

Q. (By Mr. LITCHMAN.) How many men were involved?—A. Some 3,500 on the transit line.

Q. Was that a difficulty over which you had any control by virtue of the duties of your office?—A. Only this far: Under the law which I showed you I had the power, before the strike was commenced, or after work was resumed, to form a board of arbitration composed of 4 men besides myself—that is, 2 employees in like business and 2 employers—I to act as chairman of the board. But our duties only went so far as to gather information to go before the public, having no power whatever to compel either the employees to return to work or the employers to give them work.

Q. Merely an investigation as to facts?—A. It was merely an investigation as to facts.

Q. Was that done?—A. That was only done this far: The strike began on the 7th of May, and until then almost no intimation of it was given. Under the law, the strike existing, I could not form a board of arbitration. I never formed a board of arbitration because I did not consider that under the law there was anything whatever that I could arbitrate. It was simply advisory. The strike has not yet been declared off, and those employees who were engaged at the time of the strike have never returned to the employ of the transit company.

Q. What action, if any, was taken by the authorities to protect the rights of the citizens at large?—A. Action was taken by the police. We have a police board that issues instructions to the chief of police. They did everything in the world in their power to try to control the people and to try to continue the means of travel, so that business men and those who were employed could be able to go to and from their business. For nearly 2 months a great many people, I might say thousands of people, would not go upon the transit street car lines at all, but rode in wagons.

Q. As a matter of choice; as a matter of sympathy with the strike?—A. Well, both; a great many through sympathy and a great many for fear they might be injured, feeling that that was the only means of going with safety to their places of business.

Q. These police measures were taken under authority of the city?—A. Yes; in St. Louis the board of police commissioners is appointed by the governor of the State, and the chief of police is of course elected by the board, and you may say that in a measure the police of the city are under the control of this police board, appointed by the governor of the State.

Q. Of how many does that board consist?—A. Five, with the mayor of the city, 4 being appointed by the governor.

Q. Is it a bipartisan board?—A. No.

Q. It may be all of one party?—A. Yes.

Q. (By Mr. FARQUHAR.) How many deputy sheriffs did the sheriff call out and swear in?—A. I think some 1,500.

Q. Was there cooperation between the chief of police and the sheriff?—A. Yes;

they did all they could to try to quell the disturbance, and at last it was stopped. It just seemed to die out of its own weight.

Q. (By Mr. PHILLIPS.) How many persons lost their lives, and how many were seriously injured in this strike?—A. Well, my knowledge and the best of my recollection is that there were some 14 persons killed and in the neighborhood of 150 to 175 injured. And it was estimated that the loss to the transit company was about \$1,250,000—that was their statement—and that the employees lost something like \$275,000 in wages; and it was estimated that the public at large, that is, the business community, lost over \$30,000,000 during that strike.

Q. (By Mr. CLARKE.) Were many injured entirely disconnected from the controversy?—A. Children were killed and injured, and women and men; yes.

Q. (By Mr. PHILLIPS.) Were the women injured or abused because they rode on the cars at that time?—A. Yes; it was dangerous for any man, woman, or child to go on a car.

Q. (By Mr. FARQUHAR.) In the arrests that were made for infractions of order what was the proportion of unionists as compared with other citizens that were not railroad men?—A. I do not know about that. Quite a number of the ex-employees were arrested for violating the law; but I can say this for the union, the authorities—that is, those that were heads of the unions there—that through the press, and as far as I know, they did everything they could to try to suppress all lawlessness and to keep the members of their union and those who had been employees from violating any law. And I believe that a large majority of those that were engaged in the lawlessness, the throwing of stones and trying to interfere with people, were boys, young fellows. You know how they are in the city. It was a matter of fun with them; it was an opportunity to have fun.

Q. (By Mr. PHILLIPS.) Have any persons been arrested for murder in connection with these strikes?—A. Indeed, I do not know. Those cases were such that it was generally where they could not detect them well. Some were killed and injured from dynamite bombs that were put upon the street-car lines at night.

Q. Have any been convicted for that crime?—A. No. I believe there were 5 arrested for that crime. I do not think the trial has come off yet. I think they are now in jail.

Q. (By Mr. FARQUHAR.) Has the trial been had of the parties who stripped naked the women?—A. Yes; arrests were made, and a woman was punished. She was the only one they could get, and it was a woman that was a party to it.

Q. (By Mr. LITCHMAN.) I understood you to say that the strike was never settled.—A. I mean by that the Amalgamated Association of Street Car Employees of America has never called off the strike. There has been some effort on the part of the different trades unions to call off the strike; that is to say, a large majority of them had passed resolutions to fine their members if they rode on the street-car lines during the time of the strike, and subject them to other severe penalties some to expulsion from the unions. Some of these unions have withdrawn that resolution.

Q. It would be regarded as an unsuccessful strike?—A. I so regard it, from the fact that it has never been declared off by the amalgamated association, and that the owners of the transit company positively refused to accede to the demands of the employees.

Q. (By Mr. FARQUHAR.) Did they refuse to recognize the union?—A. Yes.

Q. (By Mr. LITCHMAN.) Will you kindly state what the demands were on the part of the men?—A. I do not remember exactly. There were two demands. One demand was made on the 10th of March. I do not think I have it here. The last demand made, and which was positively refused, was that no one should be employed by the transit company unless that person belonged to the Amalgamated Association of Street Car Employees of America, and that if any men employed by the company failed to join within 30 days after the agreement should be entered into they should be suspended from work or discharged unless they did join.

Q. Was there any question of wages involved?—A. Indirectly there was at first. In the first proposition a question of wages was involved, but that was amicably settled between the employees and the company. The first strike lasted several days, and then it was declared off and the men went back to work.

Q. Was the question of hours of labor involved?—A. No; that was not considered.

Q. Do you know what the hours of labor are on the street-car lines of St. Louis?—A. No. I did know. But that was not a question of hours of labor. It seemed to resolve itself into whether or not the company should employ men who did not belong to the union—the second demand.

Q. The other questions were amicably adjusted?—A. Yes.

Q. (By Mr. FARQUHAR.) As to the second demand of the men, was that from

the failure to carry out the stipulations of the first agreement or not? Were the provisions of the agreement made on March 10, 1900, continued in force?—A. I will read from the official records of the street-car strike:

"1. The provisions of the agreement of March 10, 1900, as to rates of pay and hours of service will be continued in force by the company.

"2. Every employee of the company to be free to join or not to join any organization and no discrimination to be made for or against him because of the manner in which he exercises his freedom.

"3. Any attempt on the part of any employee to induce any other employee by intimidation or threats to join or not to join any union shall be cause for the immediate discharge of person guilty of such attempt.

"4. Any attempt to influence any employee by any official of the company to join or not to join any union shall be cause for discharge of such official.

"5. The company will meet any employee or committee of employees, whether representing themselves, other employees, or an association of employees, regarding any matter of mutual interest.

"6. For the purpose of filling vacancies which may now exist or hereafter arise, the committee of former employees, of which T. B. Edwards is chairman, shall prepare a list of the men who were in the company's service on May 7 last, and as the company now or hereafter needs additional men it will select them exclusively from this list until it is exhausted, not interfering, however, with men now in the service. No person shall be eligible to this list who has been guilty of any acts of lawlessness or violence.

"July 2, 1900.

(Signed.)

"ST. LOUIS TRANSIT CO.,

"By EDWARDS WHITAKER,

"President.

(Signed.)

"T. B. EDWARDS,

"Chairman of Committee.

"The strike is hereby declared off.

"T. B. EDWARDS,

"Chairman of Committee."

This was the last agreement that was entered into by the transit company and its employees.

Q. How many days was this after the strike?—A. The street-car strike commenced on the 7th of May. This was entered into on the 2d of July. It was signed by Mr. Edwards, chairman of the committee. But the Amalgamated Association of Street Car Employees of America met in the city of St. Louis and repudiated this agreement, and the strike has never been declared off to this day.

Q. (By Mr. PHILLIPS.) Are there any union people now employed?—A. Not as union people. They positively refuse to employ men as members of the union, but as men. That was the fight between the company and the employees.

Q. (By Mr. LITCHMAN.) Were there any reasons given, so far as you know, by the amalgamated association representatives for repudiating this agreement?—A. My information was that they claimed that Mr. Edwards did not have the right to make such an agreement without its being ratified by the amalgamated association.

Q. (By Mr. FARQUHAR.) This agreement was made by the committee of which Mr. Edwards was chairman?—A. Yes; and had acted with other employees who were members of the association.

Q. (By Mr. LITCHMAN.) Have you any knowledge as to the authority given to that committee by the association at the time of its appointment?—A. My people were there in consultation with them a number of times, on one occasion at the Southern Hotel, with the governor of the State and the attorney-general, and Mr. Hawes, who was president of the police board, and a number of other prominent gentlemen who were interested in the matter, and my understanding was they had authority to make any agreement that they thought proper.

Q. (By Mr. A. L. HARRIS.) Was it to be submitted to the association for confirmation?—A. No; not that I know of. I think the reason that agreement was not ratified by the association was that many men had been employed by this transit company who had come from distant cities, and as the company agreed to employ those who belonged to the union only in case of vacancies, and as all the places were filled, it would simply be now and then that a man could be gotten on. So they concluded it was not in their interests to accept the agreement. One agreement was made in which the street-car company agreed to take on 1,500 out of 5,500.

Q. (By Mr. LITCHMAN.) Was that subsequent to this agreement?—A. Ex-Governor Stone was employed by the employees of this transit company, and through him they agreed to reinstate 1,500, but for some reason—I do not know what—that was not accepted by the men. That was the largest number of employees, and the only definite number, that they agreed to reinstate. In this last agreement, entered into by Mr. Edwards and Mr. Whitaker, who is president of the transit company, there is no definite number stated.

Q. Was any action taken by any State official to try to bring together the association and the transit company for a settlement?—A. Yes. I made every effort in the world that I could, and did bring them together. They were together often in consultation. There was not any trouble about bringing them together in consultation, but the trouble was in getting them to agree. The governor came to the city repeatedly, and used every effort in his power. So did the attorney-general of the State; he came time and time again. We used every method in the world that we could to amicably settle the matter. There was a meeting of the business men. The league of South St. Louis called on the business men of the city to meet at the Merchants' Exchange, and I attended that meeting. A committee of 7 was appointed, composed of some of the leading business men of the city. One was Nathan Frank, who formerly represented one of the Congressional districts of St. Louis. Another was C. W. Knapp, who was editor of the St. Louis Republic; also F. G. Cramer, J. H. Lionberger, Henry Fairbank, Thomas M. Funston, and Dr. E. Pretorius, who is editor of the Westliche Post. These gentlemen were chosen by the merchants and business men and the citizens of St. Louis at the Merchants' Exchange to use every effort in their power to try to bring about a settlement between the employees and the transit company. For some 3 weeks—nearly a month—they met almost daily, sometimes twice a day; and there was no trouble in approaching either the representatives of the employees or of the road, but they would not agree, and never have agreed.

Q. (By Mr. FARQUHAR.) Was the last strenuous effort made on the part of the association simply for the recognition of the union?—A. I consider that the whole cause of the trouble was the nonrecognition of the union by the transit company. They positively refused from the beginning to do that, and nothing could be done by the State officials or by business men or anyone else to get them to agree to it.

Q. (By Mr. A. L. HARRIS.) Was that the chief question of difference between them?—A. Well, it resulted in that.

Q. (By Mr. LITCHMAN.) Is it your opinion that your authority to interfere and thereby attempt a settlement was so meager that no results could be arrived at?—A. Yes.

Q. The law was, in your judgment, followed out in that respect?—A. Yes.

Q. Now, what suggestion have you to make in regard to legislation that will reach a question of that kind?—A. I should have stated before that I notified the transit company that I intended to form this board of arbitration. I also notified the employees that I intended to form it, and while under the law I had the power to appoint arbitrators myself, I gave them the power to suggest. The employees readily consented to an arbitration of the matter, so far as the law would permit. We called it an arbitration, although I don't look upon it as that. The employees recommended two gentlemen. The transit company, through Mr. Whitaker, the president of the company, positively refused to suggest the names of anyone at all, and he assigned as his reasons that there was nothing to arbitrate, and also that under the law of the State he was not compelled in any way to comply with such a request. I can say this most emphatically. My experience and observation in connection with strikes is that the only remedy is compulsory arbitration. A law in each State should be passed that in all cases of dispute between employer and employee a board shall be appointed with power to hear all the evidence and to give a decision in regard to all matters in dispute.

Q. You mean by that that each side to the dispute should be compelled to enter an appearance before that board of arbitration?—A. Yes.

Q. How would you provide for the enforcement of your decree or finding?—A. I would enforce it by a severe penalty like I would enforce compliance with any other law where the public was interested. If it only affected the men employed and the men that employed them it would be very different; but in the instance of the street car strike in St. Louis there were over 600,000 people, more or less, affected by it. Not only that, but the trade of the city was interfered with—people kept away from the city. Why, men went to other cities to buy goods in the meantime. People would not come there to shop. The papers were full of sensational matter in regard to the street car strike; that a man's life or a woman's life was not safe in the city, and there was less traffic than there had been for years and years on the railroads running into St. Louis on account of

the street car strike. Now, that strike affected not only those employees and employers, but the public at large.

Q. As to the difficulty in the way of securing an enforcement of a finding made by your proposed compulsory arbitration: A law such as you contemplate would be applicable to all cases of dispute between employer and employee, would it not?—A. I should think so.

Q. Then, supposing a case should come up where it would be a dispute between the employed and a private employer, not a corporation engaged in a public business, such as street car service, how would you compel such a manufacturer or employer of labor to obey the findings of your board of arbitration?—A. When a State grants a franchise or a charter to any number of men within the State, giving them certain rights, I claim that the power that grants the franchise and charter to that corporation or that body of men has a right to surround the public with such laws as will protect them in their rights, under such penalties as the legislature of that State may make to the interest of the people.

Q. (By Mr. LITCHMAN.) You think, then, there are three parties to the controversy?—A. Evidently so. Not only in a case like the St. Louis street car strike, but in a case of large strikes where you may find that thousands of people may go out in any class of business; the public is affected by it, the merchant is affected by it, the customers are affected, and the country at large, just to the extent of the business, is affected.

Q. (By Mr. FARQUHAR.) You made a very broad generalization and a very truthful one in respect to the creator being able to regulate the creature by legislation. Now, what did your governor do in regulating these franchises and the owners of these franchises in keeping the peace?—A. Didn't do anything, because this law of arbitration that was passed years ago was upon the statute books. It has never been changed. In fact, I do not know that we have ever had any serious trouble in this State until this year that would call the attention of the legislature to this important matter; but I am confident of this, that the next legislature will not adjourn until the State of Missouri has an arbitration law that will be able to control, at least, those corporations to which they have granted certain powers.

Now, you ask me in regard to how it may affect private business; I say you can pass a law in regard to arbitration that will be just as effective as a factory inspector's law. You can pass a law that where 5 or more, or 10 or more, or 15 or more, or 20 or more people engage in business, that the place where those men are engaged shall be inspected so many times a year, and prescribe what the duties of the inspector shall be; and I claim that if the legislature has power to grant certain franchises to certain corporations and certain businesses, that it also has the right to pass a law that where such a number of men are employed in certain classes of business—they can specify in regard to a certain grade of institutions where the people may be especially affected, as, for instance, public carriers like our street car lines—that they can pass legislation in regard to strikes in such concerns, because the people are directly interested and affected.

Q. (By Mr. LITCHMAN.) How will you enforce the decision against the employer who refuses to abide by the decision of the board of arbitration who would go even to the extent of going out of business rather than abide by it?—A. I would pass a law that would be as effective as the law in regard to the rights of property. I claim that a man's labor and his time are his property, and that whether it is skilled labor or unskilled labor, it is as much regarded as a species of personal property as any a man might possess. I believe we have a right to constitute a board of arbitration which can be given the same power as a court to decide questions that may come up between employer and employee, and may give a judgment, and that the laws of the State may enforce that with as much effect as they can an execution going out from any court.

Q. You think that the law in a State can compel a man to remain in business?—A. No. But if an employee takes advantage of the employer that may be of injury to his business, or the employer takes advantage of an employee to the injury of his time or his interest, I think that there ought to be some remedy, and there can be a remedy for it.

Q. (By Mr. C. J. HARRIS.) Were troops called in at any time in this strike to preserve order?—A. A strong pressure was brought upon the governor of the State of Missouri to call out the State troops in order to try to suppress the lawlessness in the city. He insisted upon refusing to do it. I urged him not to do it—I told him not to do it myself; and it was never done.

Q. You have suggested compulsory arbitration as a remedy for all such strikes and lawlessness—where people were being murdered and stripped. I would like to ask you what would be the effect of such a remedy as this, namely, the enforcement by the State government of laws for the protection of the people of the city

of St. Louis and of the people who are running on these franchises granted to them by the proper State authorities? Would not that fill the bill better than compulsory arbitration?—A. No; I do not think it would, for this reason: In the case of the transit line, they had a right to make such terms with their employees as they thought proper. The law did not regulate, in my State, the number of hours—although a wage day is 8 hours in my State, and we have not only that law but a great many improved laws in regard to labor, to protect their interests—and the State has no right to say how much a man shall receive as a grip-man on a car. Now, if these men strike, they strike, and the sympathy is with these men, and they will neither ride on the cars nor, as far as they can prevent, allow anybody else to ride on the cars, and for 12 days they tie up traffic along the streets over which that car line runs. Then I do not think that the State troops ought to be brought out.

Q. I want to ask you this question, whether order ought not to be preserved by the State or city authorities at all hazards and at all expense?—A. Yes; I agree with you there, but I think—

Q. (Interrupting.) If that order had been preserved, would not the street car lines have run and carried passengers so that the citizens would have had no annoyance or interference? The street car companies were ready to run their lines, were they not?—A. Not without protection. They had to have for a number of days 23 policemen, who would run along the side, and even then, sometimes, the cars were dynamited.

Q. The point I am trying to bring out is this: Was not the whole trouble not compulsory arbitration, but the fact that the State and other authorities allowed a mob to overrun vested rights and the safety of the lives of people?—A. I do not think that the State could have—I do not think that the State had at its command the means of preventing that, as they only had some 2,400 men in the State guards. No appropriation had been made for their pay or anything of that kind. We had over 400 miles of street car line, and if every one of those men had been brought there to guard that line, with the sentiment and feeling that existed there, I do not think that they could have suppressed them. They might in time, just like it did die out of its own weight.

Q. I would like to ask you why, if your State is faulty in that respect, some legislation to cover such rights should not be made at Jefferson City instead of this law, as you suggest, about compulsory arbitration?—A. I do not think that the people of my State are any more lawless than they are in any other State under the same conditions; not as much so as in some. I feel this, that one great reason we have strikes and these questions are not settled is often on account of the unwise leadership of labor organizations in pressing these questions of importance; men who would not yield, as in this case, to anything short of a direct recognition of their unions, and virtually turning over the employment of every man of that transit company, nearly 4,000 men, to just one association.

Q. (By Mr. LITCHMAN.) Do you think that obstinacy is confined entirely to one side of a dispute?—A. No; both sides.

Q. And your idea is that if authority were given to a State board to intervene at the inception of the difficulty and compel the two parties to come together, that the necessity of calling the State militia to suppress the riot would be removed?—A. I would not like to think that we would have to pass a law in my State, or any other State, that would say the people must obey the law.

Q. Do you think it preferable to stop the difficulty at its inception by compulsory arbitration, which you propose, rather than to allow it to assume a condition where it is necessary to call in the militia or police to suppress a riot?—A. I do. I think it is one of the most sensible means, one of the most reasonable and inexpensive means of settling these troubles; and often they can be settled if you have confidence in the board and feel that they will find a righteous judgment between the parties.

Q. Have you seen any disposition to refuse to harmonize the difficulties by reason of the feeling that possibly the power of the State could be invoked by one side or the other to compel a settlement?—A. I believe that if we had had the board of arbitration that I have suggested, or if the commissioner of labor statistics had had the power to form the board, and if there had been any penalty attached to a breach of its decisions, that matter would have been settled long before it was, and would have been settled in a way to-day that it is not, because it is not settled yet. That strike is still on in St. Louis, so far as this association is concerned.

Q. (By Mr. FARQUHAR.) You say you advised against calling out the State guard. Would you regard it as a matter of public justice to call out the State guard of Missouri to protect the vested rights of a corporation that kept their

employees at inordinately long hours of labor and at a small wage, without any recognition whatever, either in an organized capacity or even as individuals—would you regard as just a law that would take the power of the State to thus protect any man or corporation?—A. No; if I was governor of the State I would not do it.

Q. (By Mr. C. J. HARRIS.) Would you not consider it proper to call out the whole power of the State, whatever it may be, in order to protect the rights and lives of men and women and children in nowise mixed up in this trouble except as citizens of St. Louis?—A. I will not say I would not call out the State guards to protect the rights of men, women, and children; but it should be the last resort, the last means of settlement, after everything else had failed; at the last extremity I would do it, and not until then.

Q. (By Mr. LITCHMAN.) You would be disinclined to do it if one of the parties, in whose behalf the power of the militia was invoked, had shown a disinclination to harmonize the difficulty?—A. Yes.

Q. (By Mr. CLARKE.) Would you consider that the governor would perform his duty to the people of his State in not protecting them, merely because a railroad company and its employees were in a quarrel which jeopardized the lives and the safety of the people of the State?—A. I think the governor should use every means possible to protect the rights of no one individual, but all the people of the State.

Q. Would not that be his first instead of his last duty?—A. Well, we may not agree as to the means that he might use in protecting them.

Q. (By Mr. PHILLIPS.) You would prefer trying to enforce arbitration first?—A. Yes, I would try every other means possible before calling them out.

Q. (By Mr. CLARKE.) I do not want to have these two questions mixed. I want the witness' definite opinion as to the duty of public authorities to preserve order and protect life and property—whether or not that is the highest and first duty, or whether it is to be relegated to the rear by some corporation's whim?—A. My opinion is, as I have stated, that it is the duty of the governor to protect the interests of all the people of the State irrespective of business or party, and to use his honest judgment as to the means to protect them.

Q. You said that you thought the governor should not interfere to protect the vested rights of a corporation when that corporation, in his judgment, treated its employees unfairly. Now, do you think it is in the interest of public order that the governor should be vested with judicial power to determine a case between contestants?—A. I think that the office of governor is not only executive but it is, in a sense, judicial in many respects, where it is not restricted by statute or the constitution.

Q. Does not the constitution make a strong distinction between the executive and the judicial authorities of the State?—A. No question about that; they are entirely separate. But questions of dispute that may arise in case of a strike are not subjects, in my State, of judicial investigation.

Q. They may be subjects of judicial investigation, may they not?—A. Only a question of damages perhaps, in a suit that may be brought. Where it might affect a franchise, then it would be a question of damages.

Q. Might it not be in regard to infractions of peace and order?—A. That might be true. That is an individual matter. That would be a subject of indictment, or a question of an individual. That would be an individual indictment as to each one.

Q. Now, you have named three ways in which a trouble of that kind may be a subject of judicial inquiry. Is there any limit, in your judgment, to the power of the judiciary to thoroughly investigate all circumstances arising from a difficulty of that kind on proper cause brought before them?—A. It may be done by injunction. Now, I overlooked something you gentlemen remind me of. That transit company carried the mails of the city of St. Louis. Those mails were carried on a contract. Judge Adams, who is judge of the United States circuit court in the city of St. Louis, granted an injunction on the 25th day of June, enjoining certain parties from interfering with the running of the transit street car company's line, for the reason that over that line the mails of the United States were being carried by this company; and that question was brought before him, and the matter was argued, and he was asked for a perpetual injunction preventing them from interfering with the transit of the mails. Now, there is a case in point where the United States court took cognizance of this strike; but they would not have done it if it had not been for interfering with the mails of the Government, which is directly under the control, you might say, of the judiciary.

Q. That makes four cases which you have named in which the judiciary can take cognizance of difficulties and apply remedies?—A. Yes.

Q. Now, I repeat my question: Do you know of any limit to the jurisdiction of the courts for the adjudication of differences between employers and employees and for the preservation of public order on a proper case brought before them?—A. Well, now, on what you say—upon “a proper case being brought before them”—I will say no, but if you leave that off, I will say yes.

Q. Do you see any inconsistency between the governor's exercising his right and duty to preserve the public peace and protect life and property and such a peaceable and helpful piece of legislation as you propose, namely, compulsory arbitration? May not the two exist contemporaneously and work harmoniously together?—A. No question. That is what I advocated. I advocated that the powers of the governor of the State shall exist as they are now, with authority backed up by the judiciary of the State, and then have this other method, that is, arbitration, which can be resorted to, and which I think ought to be resorted to before the power of the governor or that of the judiciary of the State is invoked.

Q. (By Mr. LITCHMAN.) If there be compulsory arbitration, the case would be very remote where the power of the militia, exercised by the governor, would be invoked?—A. I believe that; yes.

Q. (By Mr. CLARKE.) You, of course, before there is a disturbance of the public peace, would invite arbitration as a means of preventing such disturbances; but suppose that a disturbance has come first, and law and order are set at defiance, would it not be necessary, first of all, to reestablish law and order?—A. I think that the individuals engaged in it should be held amenable to the law and should be punished to the full extent of the law.

Q. I thought I saw a tendency to the confusion of the two remedies.—A. Oh, no; I believe where a man violates the law he should be held amenable to it. I want to say this plainly: that because a man may be one of a hundred or two hundred or three hundred he has not a right to violate the law, where if he did it as an individual he would know he would be punished. I believe a man should obey the law as a good citizen, and when the law of that country is too rigid for him he ought to get out and go somewhere else.

Q. (By Mr. FARQUHAR.) In the case of this strike, the police force was found inadequate to cope with the mob and sheriff's deputies were called in to the number of 1,400 or 1,500?—A. Yes.

Q. Jointly the two did ultimately bring peace, and controlled the mob?—A. Yes.

Q. Without calling the State militia at all?—A. Yes, not one called. The governor never issued any order to that effect at all.

Q. As to vested rights, suppose, as in that case of the St. Louis strike where Mr. Whitaker wouldn't recognize the union, wouldn't recognize any body of organized men, just as in the Cleveland strike, and the employers stood on their vested rights under the protection of the State, they held these men as it were tight in a vise, without any remedy whatever but the remedy of a strike; and ultimately that strike became a mob. Do you see where the sense of justice enters into the protection of vested rights in a case of that kind, when it is manifestly against the men and against the well being of the citizens of your own State?—A. I think, where the State grants rights to corporations or gives franchises, that there ought to be a law by which the people may be protected, as well as the men to whom these rights have been granted, and the employees whom they engaged. I do not think they ought to give to a corporation or any trust a franchise of unlimited power to act as they please where the public is affected.

Q. (By Mr. A. L. HARRIS.) Can you not carry that further, even to a partnership, that does not get its authority from State charter, on the ground that the peace and dignity of the State are to be preserved.—A. I do not see the right or propriety of the State usurping the natural powers of a court in the settlement of any dispute that may arise between any two individuals.

Q. You have a law in your State, I suppose, to preserve the peace of the State?—A. No question about that.

Q. Does not a strike necessarily disturb the peace and dignity of a State?—A. No question about that.

Q. A lockout would have the same effect, would it not?—A. Yes; but where two individuals engage in business—as partners, for instance—they may have a dispute in regard to the manner in which the business is conducted. I do not think that would be a question for arbitration.

Q. Then what would be your remedy in a case like the Homestead strike a few years ago?—A. I do not know, unless appeal to what I suggest—compulsory arbitration.

Q. But that was a partnership, as I understand—a company not operating under a charter.—A. Well, even where they do not operate under a charter, I say pass a

law like the factory inspection law, providing that where so many people are engaged in business, or may be employed, you may make that a question of arbitration, just the same as you make a place where there are five or more people engaged in work in a sweatshop, or in a factory, a place subject to inspection by State authorities.

Q. Do you see any constitutional trouble in enforcing the findings of a court of compulsory arbitration?—A. I do not; not in our State constitution.

Q. You think the decree could be enforced on either side?—A. I think it could be. I think the State has the same power by statute to create a board of arbitration with judicial authority, as it has to grant certain judicial powers to certain officers elected under the law.

Q. Would you give them particular judicial authority, or would you transfer it to the courts of record and enforce the findings by punishment as for contempt of court?—A. I would give them judicial authority; then I would make the finding a matter of record, and enforceable as any other judicial finding would be, by a sheriff or constable.

Q. Would the trouble be relieved in many States, at least—I do not know what the condition is in your State—by making a judge of the court one of the board of arbitrators, or the presiding officer—the fifth or seventh arbitrator?—A. I do not see any objection to a judge. I think you ought to get men not only of judicial knowledge, but men that are capable, that have a broad-minded and intelligent knowledge upon these questions. The judiciary are generally that.

Q. Is the sentiment in favor of compulsory arbitration growing?—A. Yes; I think it is growing in the West very largely, especially in my State. For instance, the Democratic party in the State of Missouri made it a question and put it in their platform, which shows the sentiment. They are in the majority there in the State. I believe it is not only the consensus of opinion of the Democratic party, but of the Republican party, and all parties, in fact. The majority of people in my State are in favor of arbitration.

Q. What is the feeling on the part of those directly concerned, the employer and the employee, in regard to it?—A. Well, I think the employees are more willing to arbitrate than the employers. There is a desire on the part of the men who have large interests, control large interests, not to be dictated to by anybody or to be controlled in any way—not to be hampered any more by law than is possible. They find that their money sometimes protects them in violating the law. I believe it would be fought very bitterly by large corporate interests. I believe it would be fought everywhere.

Q. You think they would rather take the risk of the destruction of their property than to submit to compulsory arbitration?—A. I believe they would be willing to assume the risk; yes.

Q. (By Mr. LITCHMAN.) Do you make any distinction between corporations which derive their power from franchises granted by the State and employments where the relation between employer and employee is personal?—A. Yes; I would make a distinction, because the corporation's powers are directly granted by the State, giving it rights to do business—given a charter with certain restrictions under the State; but I would not confine it simply to those. As I have stated before, any labor difficulty in any business in which there are a number of people engaged that is subject to supervision by the State authorities I think ought to be subject to arbitration.

Q. (By Mr. C. J. HARRIS.) Is that fair to the employers, provided it is true that you can bind the employers because they have property that can be attached, whereas the workingman, simply coming together to arbitrate, would not be bound, you may say, at all?—A. I think that it ought to be equal between the two. I do not think that an arbitration law should be passed that would work to the injury of one party to the benefit of the other.

Q. You can compel a corporation to run its works at a loss, at a certain wage that the arbitration board may decide upon, until all its surplus capital is wiped out and it is insolvent, can you not, by medium of the courts, provided you have your compulsory law properly framed? But how are you going to compel the thousand workmen to work at the wages the arbitration committee may decide upon, provided they do not choose to so work?—A. I do not think that a board of arbitration ought to have a right to say to a man that he shall give more wages to an employee than his business can afford. I think it would be absurd to even presume that a law could be passed of that kind.

Q. Suppose the board of arbitration decided on a scale of wages that the company could not afford to pay. Your compulsory arbitration does not amount to anything unless you force that company to run its business on those terms; and, as I understand, your compulsory law is going to be so framed that it will compel them to run on those terms.—A. It has never entered my head that a law should

72 INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

be passed to say to a man, You are making more money than you ought to make and are paying less than you should pay. In regard to arbitration, I think the main object with me is to prevent this great trouble that exists, where lawlessness may be resorted to by those people that feel they have been aggrieved. They can't approach their employer, as he will not treat with them except as individuals. That is one reason why I believe in labor organizations. While I am not a member of any labor organization, I can see that the greatest protection they have is in labor organizations and labor unions when they are properly managed and controlled, where they will be recognized. Now, you take in the case of a strike we had in the city of St. Louis among the shoe cutters. They waited upon me, and asked what I could do in regard to the matter. I asked if it was a question of overwork or as to time. They said, "No." I said, "A question as to the reduction of wages." They said, "No." I said, "What is the trouble?" The man said to me: "I am a shoe cutter; I have been in the business 19 years; I am skilled at that work. My business was to cut and my task was to cut 92 pairs of shoes, for which I received \$2.40. The superintendent instructed me that I had to cut 120 pairs. I said, 'How much more wages will I receive?' He said, 'Not a cent.'" Now, they increased the task upon that man and yet did not increase the hours of work nor change the wages. That was one of the causes of his striking. I asked the others what was the cause. A man said: "Well, I have been a shoe cutter for years, and the superintendent told me I had to teach boys; turn my shop into a kind of a kindergarten school to teach boys how to cut and give them one-fourth wages. I refused to do it, and I was discharged." Men strike for a great many causes. There is sometimes a lack of sympathy between the employer and employees. One is trying to simply earn a living and the other is not willing to pay anything; simply trying to make every dollar he can and become rich and independent. They do not seem to come together as they should. There is no means of reaching them. It is only through labor organizations sometimes, or through unions, that they can be approached, and a great many will not recognize them to any extent. As a substitute for that, I say a board of arbitration can be formed—not given unlimited power—I don't mean that—to go to a man and say how much he shall give this man or that man or the other man, but to limit them in their powers in regard to disputes that may arise between them. I have not thought out the plan as to how far that limitation should go, but suggest it as a means, at least, of trying to harmonize the interests of the two, capital and labor, the employer and employee.

Q. (By Mr. PHILLIPS.) The commission would like to know how any compulsory arbitration decisions would be enforced, both upon the employee and employer? How could it be enforced without interfering with individual liberty, if you please?—A. That would be a question that of course would have to be studied out by the framers of the law. I have no definite plan in regard to the limitations of authority. I have an idea, though, that it should be limited to the extent Mr. Harris suggests: that is, if a man, say, works a thousand people, and they are not getting the wages they think they ought to get, the board of arbitration should not have power to say to that man that he has got to pay those wages when they know he is losing money. I do not think the board of arbitration should have that power.

Q. (By Mr. FARQUHAR.) You have had considerable experience as a labor commissioner. You have read the proceedings of all the State boards. Did you ever know of a decision of a State or local board that destroyed a man's property?—A. No; I can say I never have.

Q. (By Mr. CLARKE.) Did partisan politics enter into the St. Louis strike in any way?—A. I do not know. Of course, there are a great many assertions that it did and a great many denials, that it did not. If it entered into it, I do not know it. If it had been just before an election perhaps it would have been different, but there was no election pending at that time.

Q. Were the State government and the city government under the same party?—A. No; the city government was under the control of the Republicans. Mayor Ziegenheim was mayor of the city, and he had control; and the sheriff was a Republican. The police force, however, was under the control of the governor of the State, through his board. The governor of my State appoints the police board; and the mayor of the city is a member of the board. The four members that are appointed by the governor, with the mayor, elect the chief of police and the officers. In fact, the police force of the city is under the control of the board.

Q. (By Mr. LITCHMAN.) The police board was Democratic?—A. The police board was Democratic, yes.

I think that factory inspection is one of the most important questions pertaining to labor in cities. While the law of our State gives to every city of 5,000

inhabitants or over the power to appoint a factory inspector, St. Louis, unfortunately, has no factory inspector and never has had one.

Q. (By Mr. C. J. HARRIS.) Why is that?—A. I do not know, I can not tell. I have used every effort in my power to try and get the city authorities to have a factory inspector. The council and house did pass a bill creating a factory inspector, two deputies, and a clerk, but the mayor has never appointed one.

Q. (By Mr. LITCHMAN.) Then the law of your State is not mandatory as to the selection of those; it is left optional with the city?—A. It says it shall be the duty of the city authorities of every city of 5,000 inhabitants and over. There is no penalty attached to it, however.

Q. (By Mr. PHILLIPS.) There is no penalty, and it is a dead letter?—A. Yes.

Q. You think it is very important?—A. I think it is very important where so many people are engaged at work.

Q. Have you looked into the law of Massachusetts in regard to factory inspection?—No; I intend to recommend to the legislature, which meets this winter, a factory inspection law which, I think, will cover the matter.

Q. (By Mr. A. L. HARRIS.) To whom do the factory inspectors of the cities report?—A. They have not any.

Q. Assuming that they do?—A. They would report to the labor commissioner. The law provides that the office of factory inspector can be held by some other officer. For instance, in Kansas City they have a building inspector, and he is also the factory inspector, and he reports to me.

Q. Does the law give to the inspector sufficient authority to enter upon the premises and make recommendations and compel compliance with the recommendations?—A. Yes.

Q. (By Mr. LITCHMAN.) Does the investigation cover sanitary conditions?—A. Yes.

Q. Safety appliances?—A. Yes.

Q. And all these matters pertaining to the safety and health of the employee?—

A. Yes. We also have a law for the inspection of bake shops that was passed last winter.

Q. (By Mr. FARQUHAR.) How efficient are your local health boards in relation to the sanitary condition of the factories, etc.?—A. I do not think they are very efficient; I do not think they are as efficient as they might be. I can say, though, that the general condition of our cities is much better than you would expect to find it in a great many places, because the employers, the men who have factories and places, seem to take great pride in trying to make conditions as pleasant and as comfortable and as safe as possible. We have a fine building inspector in the city and he looks after the building permits, and the building inspector of the city, of course, cooperates with the factory inspector, especially if it is a building where persons are engaged at work.

Q. (By Mr. LITCHMAN.) Now, branching off on general labor subjects, can you give the commission any information as to the conditions of labor generally in your State and the rate of wages?—A. I submit a list, taken from my last report, showing the average daily wages of skilled and unskilled labor in Missouri, compiled from reports as to wages in forty different classes of work.

Average daily wages of skilled and unskilled labor in the State of Missouri.

	Average daily wages paid male employees.		Average daily wages paid female employees.	
	Skilled.	Unskilled.	Skilled.	Unskilled.
1. Architectural iron, cornice, and sheet metal.....	\$2.57	\$1.28	\$2.00
2. Agricultural implements.....	2.11	1.24
3. Bakeries.....	2.27	1.45	1.08	\$0.74
4. Bags and bagging.....	2.29	1.19	1.23	.65
5. Boiler works.....	2.45	1.40
6. Boots and shoes.....	2.10	.89	1.14	.54
7. Boxes—wood and paper.....	2.27	1.23	1.17	.82
8. Breweries.....	2.53	1.45	2.47	.84
9. Brick and tile factories.....	2.27	1.31	2.00
10. Brooms and brushes.....	1.61	.8575
11. Candies and confectionery.....	2.48	1.14	.88	.54
12. Car works.....	2.22	1.44	1.00	1.00
13. Carriages, wagons, and buggies.....	2.13	1.17	1.32	1.15
14. Cigar factories.....	2.24	.70	1.61	.88

Q. Have you any sweat shop class in any of your cities?—A. No; we have very little of that. Of course the general duties of the factory inspectors cover the investigation of sweat shops.

Q. And nothing has been reported to you concerning sweat shops?—A. Very seldom I have had any report of that kind. I have a gentleman appointed for the purpose, Mr. Anderson, who was inspector under my predecessor; I have had him to inspect the sweat shops and the factories of the city, and he finds them in a majority of cases in good condition. Of course, now and then he will find an exception.

Q. You speak of the average wages per day. How many days does this figure?—A. I do not know; I do not believe I put that down.

Q. Of course an average wage of \$2.50, covering 300 days in the year, would be a great deal higher in the aggregate than an average wage that only covered 200 days.—A. I would say, in my report the average is almost to the limit —

Q. (Interrupting.) The working days of the year?—A. Yes; the working days of the year.

Q. Have you made any investigation which will enable you to know how the wages at the present time compare with previous years?—A. Yes; our wages have increased a little, not much. In some trades they have increased a little more than in others; but the tendency of the wages in my State is upward in regard to mechanical work.

Q. (By Mr. PHILLIPS.) Do you make any distinction in your statement between colored labor and white labor?—A. No.

Q. That embraces both classes?—A. Yes; it embraces all employed, both classes, in 40 different kinds of business.

Q. Have you any means of knowing how many are colored and how many white?—A. No; I have never made that investigation. There are very few colored, except in domestic work, in my State. It is an exceptional case where you find any colored labor in factories, except as porters. Neither colored female labor nor colored male labor is engaged in the mechanical arts. But a great many of them are employed as domestic help there.

Q. There are no factories that are run wholly by colored labor?—A. No; not in my State.

(By Mr. LITCHMAN.) Are the 40 employments covered by your table representative of the general industries of the State?—A. Yes; that includes not only St. Louis but all of the towns and cities where like investigations are made. Each manufacturer is compelled under the law to give the labor commissioner statistics

as to the number of persons engaged and the amount they receive and the number of days they work.

Q. Do you have any rule in sending out your blanks as to the establishments to which they shall go—I mean by that as to the number of hands employed.—A. Yes.

Q. What is the minimum number that you consider worthy of investigation?—A. Usually where five or more are engaged. Any man that is engaged in any business where he engages a number of hands—we send him a blank.

Q. This covers substantially the entire State?—A. Yes.

Q. Is there anything you desire to state to the commission with respect to general conditions of labor in your State?—A. We have a great many unemployed in our State. I have two State free employment bureaus and they are busy all the time trying to give assistance and help. Under our system, any man, or woman, or child over 14 years of age who wants to find employment, can come and file an application, giving name, age, address, former occupation, and how long they worked at that occupation, and what occupation or business they wish to engage in.

Q. Has the cause of the non-employment come under your observation?—A. That is observed by asking questions. If you ask them, very often they will tell you why they lost their job and why they have not been at work. Their causes are sometimes almost as different as the number that may come in.

Q. (By Mr. PHILLIPS.) How many such bureaus have you established in your State?—A. Two; one at Kansas City and one at St. Louis.

Q. They are employment bureaus under State supervision?—A. Yes; a party makes application for a place. Then we take an application from a party that may want a clerk, a domestic, a stenographer, or any kind of business. We file that application. It states the amount of wages they pay, and the occupation they wish to engage a person in; and we bring the parties together without cost to either. It does not cost them anything at all. That is why it is called the State free employment bureau. We have given thousands and thousands employment? I sent from my Kansas City employment bureau 1,700 men to the harvest fields of Kansas this summer.

Q. How was the transportation paid for?—A. My agent made rates with the railroads that went out into the country, and, of course, the parties got the benefit of it. In some cases their tickets would be sent by those that wanted harvest hands. It depended on the man and the crops.

Q. (By Mr. LITCHMAN.) This is an attempt on the part of the State to lessen the number of unemployed?—A. Yes. They go upon the theory, as I said in advocating it before the legislature, that the busy man, the man engaged in business, is not a dangerous citizen; it is the unemployed that have nothing else to do or think about.

Q. (By Mr. PHILLIPS.) How much of an appropriation is made for these employment bureaus.—A. Nothing. I get the same amount that my predecessor received. I receive \$24,000 a year for 2 years, out of which I have to gather all the statistics of the State in regard to the mining, mineral, manufacturing, and educational interests of the State.

Q. Is the employment bureau made mandatory upon you?—A. Yes; I have to sustain all these bureaus and also do this factory inspection; so you see I have very little.

Q. Then how is your salary paid under the law?—A. That does not come out. It is \$2,000 a year. That is paid independently. My appropriation is \$24,000, and out of that I employ some 6 to 8 people.

Q. You consider these employment bureaus really very beneficial, do you?—A. I do not know of anything that is more beneficial in the State. I think that the money spent in them returns to the State a hundred fold. There is no question about that.

Q. (By Mr. LITCHMAN.) Do you know of any other State that has a similar plan?—A. Yes; Ohio has and New York; and Illinois appropriated some \$27,000 in the last legislature, and has a free employment law. I do not know of any one thing that is more helpful to labor than that. A great many people come to the cities. The tendency is that way. If it could be stopped I believe it would be beneficial to keep people from flocking to the cities from the country and from the towns. A man gets broke in the country and the very first thought is to go to the city and find employment. He goes there. He may be a stranger, or if he has friends he exhausts their influence and then he seeks for employment and will go to one of these private employment agencies that charge from \$1 to \$5 deposit. Sometimes some of them exact all over a certain per cent of the first or second, or perhaps both months' wages. They send you to numbers that do not

exist, and sometimes to people who will keep you employed half a day and turn you off—in collusion with these employment agents. And the man, who is in the business for the money, has your money and, of course, you may go back and try it over again, not knowing the facts. You pay him another fee if you have it, and that is the way it goes. We have run from 6 to 8 out of our city by virtue of our free State employment bureau. I think finding employment for our surplus labor is one of the great problems in this country. Of course you can not legislate money into the pockets of a man that won't work and has no brains or energy or skill. That will not do.

Q. Have you given any study to immigration?—A. I have studied it this far: I think that the population of this country for its business is as large as we need. We have enough here now.

Q. (By Mr. PHILLIPS.) Would you be in favor of prohibiting immigration altogether?—A. No, not altogether; but I would be very particular about who came.

Q. Do you think our restrictive laws are sufficient now, if enforced?—A. I do not know. I think outside of the Chinamen almost anybody can come that wants to come, in some way. Now, in my State, when I became labor commissioner I found we had 445,000 acres of government land in our State—I little dreamed of it—some of it in the best mineral belt of our State. We have 40 counties in my State in which coal is mined, and we have some 26 counties in which lead and zinc are mined. We have one of the largest lead-mining camps in this country, and one of the largest zinc-mining belts. By advertising that land through my surplus production map, it was the means of selling and having homesteaded over 100,000 acres of it in the last year. We have very little iron in my State just now. What is called Iron Mountain, just below St. Louis, is about entirely exhausted. About the only county where there is much mining of iron is Dent County. There is very little iron, but there is an inexhaustible amount of coal and zinc and lead.

Q. (By Mr. LITCHMAN.) It is bituminous coal, of course?—A. Yes.

Q. And how large are the veins?—A. Up to 6 feet.

Q. (By Mr. PHILLIPS.) Do you know the area of the coal and zinc lands?—A. No. We have 26 counties in which zinc and lead have been mined. We have a large amount of capital invested in our State in the zinc and lead interests.

Q. (By Mr. LITCHMAN.) Mostly in the southwestern part?—A. Southwestern and southeastern. The large zinc deposits are in the southeast, just below St. Louis, near the Mississippi River, in what is known as St. Francis County.

Q. Where is the Joplin District?—A. That is in the southwest.

Q. (By Mr. FARQUHAR.) Is this capital that has developed these mines outside capital or is it home capital?—A. A great deal of it is outside capital, as well as home capital. A great deal of outside capital has come to our State and been invested in those mines.

Q. (By Mr. PHILLIPS.) Are the mine workers reasonably well paid in those mining districts?—A. Yes. I do not know of any State that has any better mining law than Missouri. At the last session of the legislature there were ten amendments passed in regard to mining laws, making it as near perfect as could be, because there was no objection made and the legislature would pass any remedial and beneficial law in regard to the mining interests. And we also made it an independent department, by making the mine inspector of the State the head of what is called the mining bureau, and he is now a State officer. Heretofore he was under the labor commissioner's direction.

Q. (By Mr. FARQUHAR.) Has the development of these mineral lands in Missouri improved and raised the price of agricultural lands contiguous to them?—A. I do not know that it has, only where the land is prospectively mineral. Our agricultural lands in Missouri have not increased in value. In fact I do not think they are worth as much to-day as they were 10 years ago. I do not know why that should be but it is true—outside of where there are prospective mineral lands. Of course you can get almost any price for such land.

Q. (By Mr. CLARKE.) Is it not a fact that the nearby market afforded by the employment of a large number of people in mining helps the farmers in that vicinity?—A. There is no question about that. Our State is a great agricultural State, and the surplus production of my State, according to my report, was \$185,000,000 last year; that is, over and above the home consumption, the estimated amount of production was \$185,000,000.

Q. (By Mr. FARQUHAR.) In agriculture?—A. Not agriculture, but all the interests of the State. Maybe potatoes or such products as might come in the way of vegetables, where they are shipped into those places where there is a large consumption, of course, they affect it; but I can not say that the value of wheat or corn or meat is affected.

Q. (By Mr. A. L. HARRIS.) How recent was your investigation in regard to the value of farm lands?—A. I have not made any direct investigation in regard to it, that is, to make a special business of it, but I know that the office of county recorder in my State used to be one of the best offices in a county a few years ago, and now it is not considered by far the best office in a county. There is not that exchange of property and real estate in Missouri that there was formerly.

Q. One question in connection with the unemployed that I intended to ask at the time; that is, whether that increases or decreases at any periods? In times of depression do the unemployed increase in number?—A. I think so, yes. Of course, every man that puts his money into and engages in business that requires labor, employs people; if he has not any business—goes out of business, he does not employ them. Take, for instance, the tobacco business there; we had some 7 or 8 independent tobacco firms, and when the American Tobacco Company bought out Liggett & Meyers and Drummond and such men, it turned thousands of men and women out of employment.

Q. (By Mr. PHILLIPS.) The Continental, is it not?—A. Yes, the Continental.

Q. Have you anything further to state?—A. I will just state this: I have my report here, a synopsis of it, and you gentlemen might want to know of the conditions there as compared with other years. The total value of the commodities marketed in 1899, as compared with the previous year, shows an increase of over \$5,000,000. That is general information in regard to conditions, agricultural as well as mechanical.

Q. (By Mr. CLARKE.) Is that on account of the increase of prices or increase of quantity?—A. I regard it more as an increase of quantity than an increase of price.

Q. In your State is the tendency of prices of the principal commodities that enter into the support of life upward or downward?—A. The price of wheat is increased; corn has a tendency that way. The strongest price that we have is mules; that has increased more than anything else. We had a foreign market for our Missouri mules, and the tendency of that was to increase largely in price.

Q. You refer now to a comparatively recent and short period, I suppose. Take the last decade in comparison with the previous decade—are the prices generally a little lower or a little higher?—A. I think they are higher, that is, in the majority of commodities entering into the necessities of life.

Q. Like coal, clothing, cotton and woolen clothing, boots and shoes, meats and vegetables.—A. All those things are much higher. In regard to conditions in the city of St. Louis, where I am living, the prices of all necessities that enter into the living of a family have had a tendency to increase, to the extent that there is a great number of people there in the city of St. Louis who heretofore kept house but who have broken up housekeeping and gone to boarding. The prices of these things seem to have a tendency to go up; the cost of domestic life is higher.

Q. (By Mr. A. L. HARRIS.) Has the price of labor increased or decreased?—A. No, the price is about the same. We have not a very high rate of labor. The average that we pay our domestics for general housework in the city of St. Louis is about \$12.50.

Q. Is employment more steady and continuous than formerly?—A. I do not know; I can not give that to you. I do not know that it is any more steady than it was. I think the tendency is to an increase of population of the cities and surplus labor all the time. Of course, the more liberty there is the more competition in regard to prices, and it has a tendency to cut the prices—the supply is greater than the demand.

Q. (By Mr. PHILLIPS.) Have you anything further?—A. I may add if there is anything that I can contribute I will be glad to do it. If you want any further information, when I return to my office I will give it to you specifically on any subject you desire.

I am very greatly interested in you. I do not think Congress ever acted wiser than it did when it appointed a commission of this kind. I think it is one of the most necessary and essential things to our prosperity to know the exact conditions of our country. Congressmen act usually upon what their own constituencies desire and sometimes forgot the desires of others. You, gentlemen, look all over the whole country and see these conditions and then form your opinions.

(Testimony closed.)

WASHINGTON, D. C., November 14, 1900.

TESTIMONY OF MR. JAMES B. REYNOLDS,*Head Worker of the University Settlement Society, New York City.*

The commission met at 2.10 p. m., Vice-Chairman Phillips presiding. At that time Mr. James B. Reynolds, of New York City, Head Worker of the University Settlement Society, was introduced as a witness and, being duly sworn, testified as follows:

Q. (By Mr. CLARKE.) Please give your name and post-office address.—**A.** James B. Reynolds, 184 Eldridge street, New York City.

Q. How long have you been head worker for the University Settlement Society?—**A.** Seven years.

Q. Please describe that association and its work in New York.—**A.** The University Settlement Society is a society organized to support an institution called the University Settlement. The society is composed of people of more or less means who, in order to support the work done by the University Settlement, make contributions of \$5, \$25, or \$100 a year. Mr. Seth Low is the president of the society and Mr. James Speyer is the treasurer.

Q. Is the association local or national?—**A.** It is local. I distinguish between the association, which is the supporting body, and the settlement itself, which does the work.

Q. Please state the object of the society and describe the work it does.—**A.** The object of the society is to bring together people of the laboring classes and of the wealthier classes, to compare ideas regarding the condition of society, and to work together for the amelioration of the general conditions of society, especially in the poorer quarters of New York City. That is the general statement. The specific lines of work which are undertaken by the settlement would be these: First, investigation into the social conditions of the quarter in which the settlement is located, as, for instance, we have made special investigations of the condition of the unemployed, of the relations between landlord and tenant, of the conditions of women workers, and of pawn shops.

Q. Has the society more than one settlement in New York?—**A.** It has two.

Q. Where are they?—**A.** The first settlement is located at 184 Eldridge street, on the east side of the city, the lower east side, and is in the midst of a quarter peopled mainly by Russian and Polish Jews and Roumanian Jews. The second settlement is at 38 King street, on the lower west side, in the center of a quarter where Italians prevail.

Q. Does the society own the houses that it occupies?—**A.** It owns the main building at 184 Eldridge street, but it rents the second building at 38 King street.

Q. What are those buildings used for?—**A.** For the purposes of the society.

Q. That is, offices or residences for the workers?—**A.** For both. The first purpose of the society is the work of social investigation. The second purpose I should define to be that of providing—stating it in the most general terms—providing opportunity for the people of the district to improve themselves mentally, morally, and socially. And in order to accomplish that end we have the two upper stories of the Eldridge street building, which is a five-story building, devoted to residents; that is, men who live in the building. We have on an average 8 or 10 men living there continually. These men are mainly college graduates; they are not always so, but usually college graduates; and they live there at their own expense, paying a regular price for room and board, and taking part in the work of the house. The work of the house starts with a kindergarten for the youngest children, those between the ages of 5 and 7; and for the next older grade of children we have a series of clubs, boys' and girls' clubs, the clubs being organized primarily for the social purpose, and secondly, for the educational and moral purpose. Each of these younger clubs has a manager or director, a young man or a young woman. The clubs meet once a week and the manager meets with them. The clubs are organized independently; that is to say, we believe very strongly in the principle of self-government; so that each club, even the youngest club, will have its own officers, its president, vice-president, secretary, and treasurer, in order that it may feel a sense of responsibility, and that the director may not feel that he or she is in the position of teacher, having to keep the members in order, call them to account, and look out for the general good behavior. The clubs have their own sergeant-at-arms, and, as a rule, if anything is out of the way we call the attention of the president or sergeant-at-arms to it and the matter receives prompt attention. Our experience has been that the practice of placing the responsibility for good order upon the children them-

selves works exceedingly well, and removes entirely the feeling that the director is a person to be tricked, if possible. So we find in our experience that when a matter of discipline arises the director will more often have to interfere in the interest of moderation than in the interest of severe punishment, because the children are only too willing to punish if they have the chance; they enjoy the exercise of discipline. This characterization would apply to the younger clubs meeting in the afternoon. In the evening we have clubs still more self-governing. They are composed of older members. We always try to sustain to these clubs an advisory rather than a directory relationship. These clubs also are brought together on the social basis and for moral and educational purposes. In addition to these clubs and classes, we have in the building the Children's Penny Provident Bank, with a membership at the present time of about 4,000 children. It receives penny deposits, ranging from 1 to 50 cents or \$1, from children in the neighborhood, deposits which are retained without interest and then paid back to them whenever they call for them. We have a library with a membership of about 1,100 or 1,200, which receives some assistance from the city and slight assistance from the State. And we have a series of concerts, musical classes, and musical entertainments. We have during the year dramatic entertainments. We have certain simple industrial classes; that is, classes in cooking, classes in business arithmetic, in stenography, dressmaking, etc.—although we do not attempt to have a regular industrial institute. In addition to these instrumentalities which operate in our building, we receive as tenant a branch of a society known as the Provident Loan Association. This society is otherwise spoken of as a model pawn shop. I speak of it in relation to our building—though it is a tenant—because the first investigation to which I referred a minute or two ago, which was made in regard to the subject of pawn shops, furnished the material on the basis of which this society was established. This society competes with the regular pawn shops. As you may be aware, the regular rate of interest charged by pawn shops in New York is 8 per cent a month for the first 6 months and 2 per cent a month for the second 6 months, making 80 per cent per annum. This society competes by offering loans for 1 per cent a month or 12 per cent a year. It is, however, a commercial organization—that is, commercial in the sense that it is entirely self-supporting, and that it returns an interest of 5 or 6 per cent on the investment. The branch office established in our place, which has operated for only 1 year—the first year closed last January—did a business of \$500,000, its first year among the people in our quarter. The objects pawned usually amounted to not more than \$5 or \$10 at the outside, which would indicate that a very large amount of business is done during the course of the year. I would like to say that before this branch was established we had a discussion in one of our meetings in reference to the whole subject, and a very strong desire to have such a society established in our quarter was expressed. I would like to call attention to the following point, as it developed in the course of our investigations, namely, that the pawn shop stands as the only commercial means of obtaining money, the only means by which loans can be contracted or money can be raised under any circumstances or conditions in the poorer quarters of the city. When one stops to think what it would mean in Wall street if, in ordinary circumstances, a man had to pay 80 per cent per annum for his loans, one can see how hard it is on the poor who go to a pawn shop in their extremity to have to pay these exorbitant rates. And I think you can appreciate the value of an institution of this character. I am simply interested in it because it has seemed to me to make the commercial relations of the quarter a little easier than they were formerly.

Q. (By Mr. PHILLIPS.) Are the objects generally redeemed or not?—A. Yes. In the case of the average pawn shop we found upon our investigation that from 70 to 80 per cent of the articles pawned were redeemed. In this model pawn shop, if I may refer to it by that title, last year, the first year, 98 per cent of the articles pawned were redeemed.

Q. What per cent of value do you require for pawning?—A. There is no uniform rate of value. I found, when I was making my investigation, that the pawn-brokers all agreed that, contrary to what many of us thought, they were not anxious to get the articles; and, in fact, they unanimously stated that if they had to take the articles they generally lost, and the amount of money they would loan would depend to a large extent upon their estimate of the certainty or uncertainty of the redemption of the article. If they thought an article would be redeemed, though charging a high rate of interest, they were anxious to loan just as much money as they could; if they thought the article would not be redeemed, then they were very conservative and careful. You will say, in noticing this difference in the number of articles redeemed, that there will have to be some explanation of the difference. One difference between this model pawn shop and the other pawn

shops is that the model pawn shop does not loan quite so much on the articles as the average pawn shop. It has felt itself compelled to take this position in order to protect itself. The difference between, say, 75 per cent and 98 per cent is probably due principally to the fact that not quite so large a proportion of the value of the article is loaned by the model pawn shop.

The other agency that has a room in our building, and which we rate as of very high value, is a branch of a society known as the Legal Aid Society, a society which exists in our building partly by our own contribution and partly by its own contributions and enterprise. This is a society to provide free legal counsel for the poor. The branch in our office has been in existence a little over a year and has now from 200 to 300 cases a month. One lawyer, a salaried lawyer, is there giving his whole time to the work, and two of the residents of our building, one of them a graduate, a lawyer by profession though not in practice, and another, a law student, voluntarily give a certain amount of their time to the work. We were led to undertake this work because we found that the legal counsel and aid given to the people was very defective. The tendency of the legal aid so given was also to encourage litigation, and consequently to encourage the expense of litigation, and the professional lawyers of our quarter, to a considerable extent, simply preyed on the people in that way.

The only other organizations which need to be named that meet in our building are certain labor unions. We have the central labor body of the city, called the Central Federated Union, which is a regular tenant. Its regular session is on Sunday afternoon. Two sections of the organization meet on Tuesday and Wednesday evenings. We have four other organizations, trade unions, meeting in the building as regular tenants of our society. All these organizations pay their regular rental to us, as they have paid elsewhere, and simply have the privileges and use of the building. We have recently opened our library to the trade unions, and have supplied a certain amount of special literature on economic subjects, which would be of special value and interest to them.

Q. How large a building is required for this work?—A. It occupies a space 67 by 80 feet. The striking thing in connection with the coming of the trade unions to our building is this: All these trade unions were heretofore meeting in halls that were adjacent to or a part of saloons, and all of them in coming to our building or in opening negotiations regarding the building indicated that they would like to meet in halls that were not connected with saloons; that they felt that the influence of the saloon was often injurious to the business seriousness of their meetings and to the quiet and decorum of the meetings, and that they would like to meet in places which would not have that kind of influence. A number of them, at least, stated to me, however, that in canvassing in different parts of the city they found it was practically impossible in New York to find any hall at such a rental as they could afford to pay which was not attached to a saloon. The saloon relationship is always made easy, so far as the rental is concerned, with the result, however, that it is understood and expected that the members of the union will patronize the bar, and will "take it out in trade." For instance, a member of one of the unions which is now meeting in our building told me that they met formerly in a hall on the second floor of a building to which access was obtained through a long passageway from the street, but on the night when their union met the door of the passageway was always closed and barred, and access was only through the saloon, so that the members had to pass around in front of the bar. And, as they were occasionally reminded of the fact that they were paying practically a nominal rental, they felt, in the interests of decency and generosity, that they must patronize the bar. The result was that the managers of the union said that they found when they had serious business that the condition of some of their members was such as to prevent the consideration of business in the serious and dignified way which they desired. So we have felt that we were making a very valuable contribution to the serious and orderly consideration of labor matters by being able to provide the use of our rooms for labor organizations, and to provide them on such a business basis that they could come to us with perfect self respect. Those would cover, I think, the principal works going on inside of our building.

Q. (By Mr. CLARKE.) I would like to inquire how these outside societies which are domiciled with you are organized and maintained. Take the Legal Aid Society, for instance.—A. That is an incorporated society which has its outside support, like any other philanthropic society—it has its president and secretary and treasurer, and it has a regular list of supporting members. The Provident Loan Association, as it is called, is organized in the same way, though it has a capital stock.

Q. Those societies are benevolent then, very largely?—A. Yes.

Q. Do the lawyers employed by them charge fees, or do they render the service gratuitously?—A. In case of the Legal Aid Society the lawyer receives a salary.

He only charges 10 cents for the registration of a case; but if, as the representative of the society, he brings a suit to recover a certain sum of money, then, I think, 20 per cent of that money is handed to the society as compensation if the money is recovered; if the money is not recovered, no charge is made. But advice is given gratuitously.

Q. How is that society and that kind of service regarded by the bar association or the legal fraternity generally of the city?—A. Most of its contributors are members of the bar association, and lawyers. The society has been very careful not to take up cases where there was no reason why these people should not hire an independent lawyer. It only takes cases of extreme poverty. It would be very cautious on that point.

Q. This then practically is a way devised and conducted by the legal fraternity for extending the benefit of counsel to those who could not otherwise have it?—A. Practically, yes.

Q. How many people are connected with your work?—A. Well, the only way that I could estimate that would be by giving our record as to the number who use the building weekly for specific purposes—who are recorded as attending, members of our clubs, as drawing books from the library, or depositing money in the bank, or attending meetings of the organization. The number who use the building in one way or another is about 6,000 weekly.

Q. Is the number increasing?—A. Yes, steadily increasing. In fact, our difficulty now is to find accommodations. The number is increasing without any effort on our part. Our difficulty is to find accommodations for societies, and organizations established by the young people and adults in our district, who desire the use of our rooms, and such help as we may render them.

Q. Do you go out among the people see them at their homes and places of employment, to interest them in your work, or does the fact of its being planted there attract their attention so they voluntarily come?—A. Our work has now been established 14 years. The work in the second building has only been in existence a few months. In the earlier part of the time we had to do a certain amount of canvassing to make the work known. Now we do no canvassing or visiting for the sake of making the work known. The directors of clubs occasionally visit the homes of members of the clubs, or we go to see the members in connection with labor organizations, but there is no visiting to drum up attendance. We occasionally announce meetings in the papers, but that is all.

Q. How many workers do you usually have?—A. From 8 to 10 resident workers, and from 40 to 50 nonresident workers.

Q. How about nonresident workers?—Do they come and reside a while and then go away, or are they mere day visitors?—A. Day visitors.

Q. Are most of your workers graduates of colleges?—A. Most of the residents are; most of the nonresidents are not.

Q. Are they of both sexes?—A. Yes. I omitted to state that we have also a bathing establishment in our building—5-cent baths provided.

Q. Are they patronized considerably by the 6,000 people who go there?—A. Yes; and by a great many others who would not be members of our clubs and classes. During the summer a great many of the working people of the vicinity take advantage of our baths.

Q. Have you been able to discover any improvement in that class of people in respect to cleanliness as a result of those conveniences?—A. I should say that we could. Still, a matter of that kind is a matter of which one hesitates to speak, and of which it would be very difficult to record indications. But we certainly find that there is an increasingly strong element in the community, of those connected with the clubs, who have availed themselves of these other privileges, who themselves stand for cleanliness, health, and morality.

Q. You try to civilize your people by improving their methods of living?—A. Yes; both in their individual life and in their community life.

Q. So that considerable teaching and discussion is devoted to topics of that character?—A. Yes; a great deal.

Q. (By Mr. FARQUHAR.) Does it enter into questions of morals and religion directly?—A. Not into the question of religion at all. We are entirely non-sectarian. But the question of morals we do enter into.

Q. (By Mr. PHILLIPS.) You have various denominations, do you?—A. Oh, yes; our supporters are Protestants, Catholics, and Jews.

Q. (By Mr. CLARK.) Speak, if you please, of the nationalities and the occupations, and in fact all the surroundings of the people who are affiliated with your work.—A. Well, in the 14 years that we have been there we have had a glimpse of the rather curious procession of races which has marched up New York City during the last 40 years. As is probably known to you, 50 years ago the quarter

just east of the Bowery was an American quarter and the dwelling place of some of the wealthy families of the city; but about that time the Irish immigration began, and the Irish pushed the Americans uptown.

Following the Irish came the Germans; and the Germans, by their rather more careful and more thrifty methods of life, drove the Irish uptown. The Irish had become fairly well settled and understood the conditions of the country and were better able to look out for themselves, and they moved up.

Following the Germans, about the time that we established our settlement, say in 1877, came the Jewish immigration—the Russian and Polish Jew. They crowded the Germans out. When we began, our immediate district was almost equally divided between the Jewish and the German population. But the work of exclusion of the German population has gone steadily on until that quarter is practically monopolized by Russian and Polish and Armenian Jews. There is a large public school opposite our building, and the principal told me recently that from 97 to 98 per cent were Jewish children, and the same is true of several other schools in our immediate vicinity.

There is now developing the next product of this social army, namely, the Italian immigration. Within the last 3 years they have begun to press into the quarter; coming from across the Bowery in Mulberry street, where they are established in large numbers, and pushing east in our direction and west into the west side where our other settlement is located.

If you follow the city down a little farther you will find small detachments of Syrians and Greeks and Armenians; but that is about the procession of immigration we have had occasion to witness in the last 10 or 15 years. Now the population is largely Russian, Polish, and Armenian Jews. The persecution of the Roumanians in the last few years has sent large bodies of the Roumanians into this country, and they are crowding at present into our quarter.

Q. Are they generally thrifty people?—A. Generally very thrifty, yes; hard workers.

Q. Not so poor as to be objects of charity then, in any way, are they?—A. I should be inclined to say that more of the Roumanians than of the other races who have gone before are objects of charity for this reason: many of them had been in good condition in their own country, perhaps in better condition than the average of the other races, but the persecutions have been so severe and so widely extended as to deprive them of their energies. As to this Dr. Blau-stein can testify more fully, as he has been very recently in Roumania. We see them as they come to us, and from what we see of their abilities and capacities, we can see that they are people who have been above the ordinary in their own country under ordinary conditions.

Q. Do they voluntarily seek your settlement and avail themselves of its benefits, or do you have to first find them and acquaint them with liberty?—A. They voluntarily seek us. We have in our building two societies of Roumanian ladies, which have been organized for the sake of helping more indigent members of their own race who come to this country; and they have more or less made our building their headquarters, so that through them the newcomers are made acquainted with our work and come to us for help.

Q. You maintain amusements in your settlements?—A. Yes; we have a gymnasium on the ground floor and a roof garden for summer purposes on top, and we have a good deal of recreative work. We organize outings in the summer; have a summer home for girls and a summer camp for boys.

Q. Is the greater part of your work devoted to the young?—A. It would be hard to say what was the exact proportion of youth and maturity. I should think a little more than half of the people using our building were less than 21 years of age. We have a great many grown people.

Q. (By Mr. PHILLIPS.) Are there many quite old people?—A. No.

Q. (By Mr. FARQUHAR.) Do the parents of the children take an immediate personal interest in your work and visit your building?—A. Yes, a good deal. There is, of course, a rather sharp line of cleavage—an unfortunate line of distinction between the parents and the children. The parents have come to this country not knowing the language and not acquiring it easily. The children come, enter the public schools, quickly acquire the language of the country, and become interpreters for the parents. They thus acquire a certain confident Americanism without much difficulty; and I regret to state that in a number of instances they become rather ashamed of their parents, which I regard as one of the most unfortunate circumstances one has to record.

Q. Is it not in all great cities pretty much the same?—A. With the added reason of the difference in language—that the children can speak English and are taught at a very immature age their superiority to their parents, as they have to be called

in as interpreters. I think for that reason the children do not bring their parents to the settlement so much as they otherwise would.

Q. Is there a great variety of employments represented by the people who come to your settlement?—A. Yes. The predominating trade in our quarter is the garment-making trade, but our unions include metal workers and building workers; and the central body represents every trade in the city; but the garment-making trade and the flower workers and feather workers are the main trades.

Q. (By Mr. CLARKE.) Are the occupations of garment making and feather and flower work, etc., sweated industries in your quarter?—A. Yes, they are.

Q. Have you had occasion to investigate the sweating system as it is practiced there?—A. Yes, I have.

Q. Will you give us your views on that subject?—A. I shall be very glad to do so. The first general statement I would like to make is that the garment-making trade has financially degenerated as a result of the rush of immigration during the past 15 years. The trade, until the last 15 years, was in the hands of the Irish women and German men to a very large extent, and while considerable work was done in the homes, more work was done in the shop; but with the development of the ready-made clothing industry and of the Russian and Polish immigration, there arose on the one hand the need of workers, and on the other a very earnest desire on the part of these newcomers to pick up some trade that could be easily acquired and quickly exploited; and the garment-making trade proved to be a trade that was ready for them because of the demand I speak of. The operator is perhaps the lowest grade of worker in the trade. The operator's assistant, for instance, can qualify himself for the work inside of 2 weeks, so that after he has worked 2 weeks he can begin as operator's assistant and get small wages. So it has happened that the Jewish immigrants have, to a larger extent than into any other trade, poured into the garment-making trade, and each succeeding batch of immigrants has been another factor to disturb the conditions which have been established by the previous batch in its entrance into the garment-making trade.

What has happened is this: The Germans have been largely driven out of the trade. The trade has been to a large extent reorganized so that the work now is done with a few exceptions in the small shops and in the private houses or homes or apartments of the people.

About 5 years ago there was an attempt to start work in the factories and to strengthen the factory as against the small sweat shop or the work in the private apartment. That attempt has thus far not been a great success. The introduction of electrical machinery and other kinds of machinery for propelling sewing machines has proved an obstacle. I had occasion to notice only yesterday that two of the largest cloak-making manufacturers in New York City had retired from business, stating as a reason that they found it impossible to compete with the small shops on the east side. The condition the small shop on the east side creates is this: Where there is a large factory the men, being more or less efficiently organized, are able to watch it and see that it maintains the standard of hours and wages. The regular standard would be 10 hours, and wages might vary—the operator's assistant perhaps not getting more than \$5 or \$6 a week, and running from that up to \$15 or \$18 a week for the operators and pressers; and other workers from \$15 to \$25.

Q. (By Mr. C. J. HARRIS.) Were these operatives the sweat-shop people?—A. These are not sweat-shop people.

Q. They get the wages you state?—A. Hardly the cutters. Take the cutters out, and occasionally some of the workers would even get the highest wages that I have mentioned.

Q. (By Mr. LITCHMAN.) You mean in the factory, or the home?—A. In either place, but more usually in the factory than in the home. The home workers are as a rule less skilled workers. In the small shops you will find the more skilled workers, and in the large factories the most skilled workers.

Q. (By Mr. FARQUHAR.) Please state why the factories are not able to compete with the private homes and the smaller factories, if you had any reasons given you by those who control or operate these factories.—A. The reason they give is that with their large establishments they have to have a longer time in which to prepare themselves for the season. These small shops can receive their orders and fill them on 8 or 4 weeks' notice, and rush through a small order, while the large shop could not do with its large orders. I am satisfied, according to their statements—I am not personally informed—that the small shop can make up a small lot of goods in a greater variety of styles for the Western customer and fill his order, while the big shop is not able to do this.

Q. (By Mr. C. J. HARRIS.) Is a great deal of this agitation about sweat shops a

matter of business competition and jealousy between two classes of manufacturers?—A. Well, there may be. I suppose usually in such agitations there is apt to be a small element of that sort. It is to the large manufacturers' financial interest to abolish the small sweat shop, and it is possible that the interests of the large manufacturers are identical with the interests of the worker. The small shop is usually the shop of the contractor.

Q. You mean the sweat-shop worker?—A. I mean the sweat-shop worker, yes. The unions of the garment workers officially condemn the sweat shop.

Q. And they abuse the sweat shop workers, don't they?—A. The sweat-shop workers themselves join in the condemnation whenever they dare do so.

Q. What would the sweat-shop people do if they lost their job?—A. Their theory, of course, is that there is a certain amount of work to be done and it will either be done in the homes, or shops, or large factories. They believe their conditions would be better if the work was done in factories than if done in homes or in shops.

Q. Do you believe it is necessary to persecute these people by a more rigid inspection so that they shall not be able to do work at their homes any more?—A. Well, if you call that persecution, I should say yes. While in a few instances the word persecution might be a fair word to use—in a few instances the home might be clean and the hours respectable, and the return reasonable—in the very considerable number of instances you find this home work means an undesirable number of hours of labor, an undesirable small pay, and undesirable sanitary conditions.

I had occasion three or four years ago to make an investigation in company with the secretary of one of the unions. He had a list of 125 workers. Most were working in small shops. They were all working in some kind of shop, either a shop where only work was done, or a shop that was at the same time a residence apartment of some small contractor. Out of the 125 workers—the average time of work being 10 hours—he mentioned to me 16 by name who he knew were working 12 hours per day; 8 who were working 14 hours per day; 6 who were working 18 hours, and 4 who were working 20 hours per day right along.

Q. Who gave this time of these sweat-shop working people, the people themselves? If working for themselves, no one keeps the time for them as would be the case in a regularly established factory.—A. There were none of them who were working absolutely for themselves. They were either in shops which were only shops, or in shops which were residences and shops at the same time.

Q. You say they were working for other people 20 hours per day?—A. Yes; and sleeping in the shop.

Q. (By Mr. KENNEDY.) Members of the union?—A. Yes.

Q. The officials of the union could easily find out how many hours they were working?—A. I believe his information was correct, and he was one of the most careful men in his statements that I have ever met.

Q. (By Mr. C. J. HARRIS.) How many days did they work 20 hours a day; or was it a fact that they worked each day 20 hours?—A. I can not say.

Q. Do you mean to say they worked right along, some of them, 20 hours per day?—A. Twelve months in the year.

Q. I mean right along steadily, say for one week or one month. Is that the habit?—A. No; I stated there were only 4 out of the 125 who were working 20 hours per day. I asked him to give me an explanation of those working 16 hours and those working 20 hours. He said: "I know personally who these men are who are working 20 hours. They are all men who have come over to this country alone, and are very anxious to bring their families over. They probably will not work more than one season for that length of time; but it has a very bad effect on the trade, because they are not getting wages commensurate with the length of time they work, and consequently they encourage the employer to extend the hours of labor and also encourage the cutting down of wages."

Q. (By Mr. LITCHMAN.) Is the compensation by the piece or the day?—A. It is a combination of the two ways, by the day and piecework.

Q. (By Mr. FARQUHAR.) By the hour and by the piece?—A. Yes.

Q. (By Mr. C. J. HARRIS.) You are familiar, of course, I presume, from your position, with the poorer portions of New York. Are the quarters of these sweat-shop workers the worst there are in New York? Is it true that other classes of laboring people, whose work is perhaps uncertain and poorly paid, are as bad off? Is it true that the homes of these sweat-shop workers are no worse than those of certain other classes in New York?—A. While it would be true that they are no worse than certain others, I do not know of any permanent trade whose conditions are at the present time so bad as the conditions which are found to a large extent among the homes of those working in the garment-making trade.

Q. Is it or is it not a fact that the sweat-shop system of New York affords, then, nearly the only work that very poor and ignorant people, just landed in this country, can take hold of readily and keep body and soul together?—A. Yes; if you except unskilled labor, that is true.

Q. They can work on the docks and similar work, I suppose, but they would require some knowledge of the language at least?—A. Yes.

Q. (By Mr. LITCHMAN.) Do you know of any other employment where the product of that employment is likely, by reason of insanitary conditions surrounding the production, to convey disease to the consumers of the product?—A. The feather and artificial flower trades are of a somewhat similar character. Most of the workers are women in those trades.

I have here, if I may present it now, a statement of 697 cases in the investigation of which I have assisted during the last 6 months. I happen to be a member of the State Tenement House Commission, and we desired to examine as to the operations of the factory-inspection laws in the tenement houses. Our investigations related to the feather workers, and the garment workers, and the flower workers. I have here [indicating] reports concerning the feather workers, the necktie workers, and the garment workers. We examined 697 cases. We found that out of 15 cases of flower workers examined, 4 of the workers' houses or apartments were in bad sanitary condition. That is, there was what was deemed to be inadequate light, or inadequate ventilation, or bad smells, or something of that kind that would tend to indicate an insanitary condition; among the necktie workers, 4 out of 41. Among the Italian garment workers, 73 out of 205 were in unsanitary condition in the borough of Manhattan. Among the Italian garment workers in the borough of Brooklyn, 10 out of 103 were in unsanitary condition. Among the Russian and Polish workers in the borough of Brooklyn, 5 out of 99; and in the borough of New York, 8 out of 113.

Then, too, regarding cases where the working rooms were used as sleeping rooms: The flower workers, 10 out of 15; in the case of the necktie workers, 12 out of 41; in the case of the Italian garment workers in the borough of Manhattan, 113 out of 205; of the Italian garment workers in the borough of Brooklyn, 33 out of 103—about 1 in 3; of the Russian and Polish garment workers in the borough of Brooklyn, 5 out of 99; of the Russian and Polish garment workers in the borough of Manhattan, 18 out of 113.

Q. (By Mr. C. J. HARRIS.) What was the cause of those insanitary conditions; the fact that they did not make enough money to procure better quarters, or in perhaps the training and bringing up in the countries from which they emigrated?—A. I have no doubt it was in a measure. You see by the statement that the evil was greater among the Italians than among the other workers. That was one of the seeming facts that we discovered; that is, in a measure it is the result of old environments, as I know from having visited Italy—in a measure the result of overcrowding. The Italian community is very much congested, more so than any other community in New York City, with the possible exception of the Jewish.

I have here a statement of the apartments where there were more than one family—apartments of three rooms. In the borough of Manhattan, the Italians, out of 205 apartments, 58 contained more than one family; and among those Italians in the borough of Brooklyn, 17 out of 103; whereas among the Jewish workers, out of 99 in the borough of Brooklyn, there were but 2 cases where there was more than one family; and in the borough of Manhattan, 3 out of 113. One of the worst evils we find among the Italian workers is their disposition to crowd more than one family into an apartment. That crowding would inevitably bring carelessness and lack of consideration and lack of ordinary neatness the overcrowding making it extremely difficult to overcome these conditions.

Q. These families that live in this insanitary way—about what wages would they earn per week?—A. The statistics which we gathered in these cases, I am inclined to think, would be of very little value, for the reason that where they were working in their homes, as in these cases—for we have not taken the shops and factories—the hours vary so much, and very often they brought in extra workers to work with them. So I do not know that a statement of the wages in these cases would be of any great value. I feel the statement of conditions is accurate; I do not think the statement regarding wages is.

Q. Why is it these apartments are in this unsanitary condition, when you have inspectors in New York to attend to that?—A. That is easily answered. A year ago the first of last September a new law came into operation in New York, requiring the licensing of all work done in tenement houses, garment making, cigar and cigarette making, etc. As a result of that, about the first of January, when the law went more seriously into operation, the department was swamped with applications; and they had handled from 12,000 to 15,000 applications, and

the factory inspector told me in his last statement that they would likely amount to more than 20,000, from the first of September a year ago to the first of the coming January, and as a result the office has been swamped with work; and the force at present in the factory inspector's office is, in my opinion, not nearly adequate for the work it has to do. I happen to be chairman of one of the subcommittees of the tenement house commission, and our investigations lead us to feel that there should be a considerably larger number of inspectors than there is at present.

Q. (By Mr. FARQUHAR.) How many inspectors have they in the Manhattan district?—A. About 23 in the Manhattan district.

Q. (By Mr. LITCHMAN.) Is this investigation you have been making in the tenement house system to be the basis of recommendations to the governor, and from him to the legislature?—A. Yes.

Q. Your conclusions have not yet been reached?—A. No.

Q. (By Mr. FARQUHAR.) Would there be any difficulty with 25 or 30 inspectors in the sweat shop district of Manhattan or of Brooklyn, in thoroughly inspecting those once a week, properly divided?—A. Not if properly divided and all giving their attention to that business. I think they could create almost a revolution. But the difficulty we find when it comes to the actual enforcement of the law, which causes an immediate protest, especially from the contractors and to a certain extent from the manufacturers outside—is that if you start to enforce this law, what you will accomplish will be not the abolition of the evil but the mere transfer of the evil from one State to the other. That is, you will accomplish what we accomplished about five years ago when we pitched into some of the sweat shops and they simply moved from New York to New Jersey.

Q. (By Mr. LITCHMAN.) Suppose you chase them into New Jersey?—A. Then they will move into Pennsylvania, probably.

Q. (By Mr. C. J. HARRIS.) They have moved from Boston to New York, have they not, to a certain extent?—A. Yes, only the law having been strictly enforced in Massachusetts, in the West the Massachusetts goods come to have a value of about 10 per cent greater than the New York goods. This higher price is paid, representatives of the trade have said to me, because it is felt that the Massachusetts goods are more likely to be made under sanitary conditions. So the enterprising Massachusetts garment maker sends to New York and has the goods made up and then brings them back and has the Massachusetts label put on and sends them out.

Q. (By Mr. CLARKE.) I do not think there are many such from Massachusetts who patronize the New York sweat shops, do you?—A. I think there are a considerable number. The Massachusetts factory inspector told me so and the New York factory inspectors and the New York garment makers tell me so; and they had a special investigation made by the Consumers' League of Boston, with a view of finding out about this.

Q. (By Mr. FARQUHAR.) How many licenses did you say were granted there?—A. Already granted about 12,000.

Q. That would show that there are at least 12,000 or 14,000 sweat shops operating in New York?—A. Yes. New York has a far larger amount of garment-making business than any other State in the Union. By contrasting the New York work with the Massachusetts work, I may say that in the State of Massachusetts during the last year, in the entire State, there were 953 licenses granted for garment-making work. In New York City—in Elizabeth street alone, a street about 8 blocks long—during the period from September 1 to January 1, there were 990 licenses granted—in that one street alone more than in the entire State of Massachusetts.

Q. (By Mr. KENNEDY.) Has the question been raised of the inspectors being derelict in work as the result of corruption or any other interests?—A. There has been a slight question of that sort raised, but nothing has been proved; and the only attempt to prove anything of that sort was a failure. The investigation did not substantiate the charges made.

Q. (By Mr. FARQUHAR.) Did not prominent newspapers make that charge?—A. It was brought in one or two papers, and the governor appointed a special commissioner, and he made a special investigation. I was a member of the special commission appointed by the governor last January to make certain other investigations. All of us made investigations regarding the New York office of the factory inspector, and we reached the conclusion that, while there might be a little greater efficiency, possibly the office was tremendously overburdened with work, and that it was not fair to blame the office with the conditions found.

Q. Have you found a willingness on the part of the officials of the city of New York to cooperate with you in advancing that inspection?—A. Yes.

Q. Have you ever asked for anything in reason from the legislature or the governor that was refused?—A. No; with the one exception that we wish the factory

inspectors were increased a little more rapidly in number; but there has been a steady increase.

Q. The last increase was made exactly up to the demands of the factory inspector at that time?—A. I believe it was; yes. The governor himself has taken so much interest in this particular department that he came to the city last spring and gave a day going with us through certain houses that had been selected, which were considered representative.

Q. (By Mr. PHILLIPS.) Of the most indifferent houses, or the better class?—A. The most indifferent.

Q. (By Mr. C. J. HARRIS.) The worst?—A. Practically the worst; yes. What he wanted to determine was what was the lowest standard under which work was performed.

Q. (By Mr. CLARKE.) Do these sweat-shop workers usually acquire property?—A. No. They live, you see, in these large five-story tenement houses, and not only do not acquire property, but do not maintain a residence very long. When making the special investigation we learned that the landlords calculated that a given apartment would be occupied on an average 10 months in the year, there was so great and constant a change among the tenants. Consequently his scale of rental was based on an occupancy for 10 months instead of 12 months.

Q. Where do they go?—A. They go to the next place. Those in the most unfortunate financial condition or the least diligent come to a certain place, and they have to make a deposit when they enter. They stay a certain number of months, and when they have made up their minds to leave, they let the rent go as long as the landlord will let it go and they economize and save and are able to pay a month's rental in advance at the next place.

Q. They go to a worse or better place generally?—A. I do not think on the average there would be a great deal of difference.

Q. You spoke a while ago of the Germans having been driven out in their turn from this business and from this region. Have they in general improved their condition and gone into some better occupation?—A. Yes; the Germans have.

Q. (By Mr. PHILLIPS.) And the Irish the same?—A. The Irish the same.

Q. That is one reason of the change—because they are moving up higher?—A. Yes; and because they have come to understand the ways and conditions of the city and to know how to find their way about—establish their independence.

Q. (By Mr. CLARKE.) Is it not your observation that the more Americanized any foreign element becomes, the harder it is to subject them to grinding conditions in any industry?—A. Yes; I should say that was unquestionably true. And the only thing I am particularly anxious to do is to promote conditions which are American, that were unknown 25 or 40 years ago and which represent the Americanism we wish to establish.

Q. Do you think the packing in together of several families in a small apartment or suite of apartments is so great an evil as it was 10 or 15 years ago?—A. The packing in of families, provided each family has an apartment, I do not think is as great an evil as it was 10 or 15 years ago for the reason that at that time the tenement house was usually a residence formerly occupied by one family, and that kind of house turned into a tenement house always has dark rooms, unsatisfactory sanitation, and other unsatisfactory arrangements.

Q. (By Mr. PHILLIPS.) The law in regard to tenement houses, their conditions, size or air space, etc.—is there not a requirement of law in regard to the construction of these tenement houses?—A. Oh, yes; there are requirements of the buildings department regarding air space and construction and requirements of the board of health regarding light.

Q. Are the landlords required to improve the condition of houses which formerly existed, or does this pertain to new houses only?—A. Largely to new houses.

Q. Does it not enter into the regulation of old houses and require proper air space and sanitary conditions?—A. In a measure, but not so effectively.

Q. (By Mr. FARQUHAR.) Do not the inspectors condemn the old and force the landlord to improve them?—A. They condemned quite a number of them 4 years ago. I think the results in the two classes of houses are fairly well indicated by the fact that on the lower west side, in these old houses with rotten woodwork and defective plumbing—the prevailing disease is typhoid or typhus; and on the east side, where the evil is lack of light, the prevailing disease is tuberculosis.

Q. (By Mr. CLARKE.) Do the children of the sweatshop workers usually follow in the footsteps or occupations of their parents?—A. To a limited extent. I think to a less extent than is desirable, barring the conditions. But that arises because of the defects in our popular education, which is too academic, and fails to provide manual training. More than 55 per cent of the children have got to earn their livelihood by their hands; and when you consider that when they leave the

public schools they are absolutely incapable of using their hands for any purpose whatsoever, you will see how defective the public school is in that particular. I have a great many children—boys and girls—sent to me by parents and others when they leave the public schools about the age of 14, and they want to see if they can get a place to work. I say, "What can you do?" And the regular answer is, "Nothing." I ask, "What do you want?" "Want to get into a store."

Q. (By Mr. PHILLIPS.) Would you care to describe the condition of some of these sweat-shop houses—sanitary conditions and otherwise?—A. Well, I do not know that I could give a fitting description that would be of any great value. I have named the evils that one would find. In the garment-making trade, take two or three houses that we visited with the governor, where we found the garments were kept in one instance in a sleeping room where the bed was occupied by a man who seemed to be in the last stages of tuberculosis. The garments were being piled up in that room, which was dark. The garments were kept there and the workers were at work in the front room. In many instances we found garments on the floor, and the floor filthy. We found the rooms dark, the ventilation bad and the gases at times coming up from defective plumbing. I saw in the Italian quarter not only instances of two families in a single apartment working, but even three families in a small apartment.

Q. There would not be sufficient air space in such a room?—A. No.

Q. Did you find anything as to vermin in such places, as well as disease?—A. Yes; a good deal of that. Vermin always abounds in these houses. The characteristics I have mentioned are those which appear generally. I do not mean in all the tenement houses, but in houses of that character.

Q. (By Mr. FARQUHAR.) What is the average time, in the 12 months, that these sweat shops are usually employed in New York?—A. On an average about 6 to 8 months. The season is rarely longer than 8 months.

Q. Is your season divided into spring work and the fall work?—A. Yes. Spring work begins about the middle of February and fall work about the first or the middle of August.

Q. (By Mr. PHILLIPS.) Have you directly traced disease to such places by the sale or handling of these goods?—A. I do not think that has ever been done in this country. In connection with our commission there is a special investigation being made of the subject of tuberculosis in the tenement houses in Germany. Such an investigation was made in England, but it was the result of two or three notable deaths.

Q. But you have reason to believe diseases of various kinds are started in this way?—A. Yes. We have a number of well-established cases where garments have been taken out of houses where disease was actively present.

Q. (By Mr. A. L. HARRIS.) What kind of garments are usually made in these sweat shops?—A. They are of all sorts. The statement has been made by others, which I can not substantiate, that there is not a garment-making establishment, from the lowest to the highest, on Fifth avenue that does not send its work into the tenement houses.

Q. If I desire a fine suit, I have no assurance it is not made in the sweat shop?—A. No; absolutely.

Q. (By Mr. PHILLIPS.) If you leave your measure with a first-class tailor on Fifth avenue, have you no assurance that they will not be made in the sweat shop?—A. No. The Consumers' League have found astonishing instances where work they knew to have been taken in these establishments turned up in the sweat shops.

Q. (By Mr. FARQUHAR.) Do you think it is possible to have a garment made in a sweat shop that bears the tailors' union label?—A. I think it is; yes.

Q. You have no knowledge, of course, of its ever having been done?—A. I have no personal knowledge.

Q. Do the custom tailors along Broadway and other prominent streets, where they use the journeymen tailor labor—and they have quite a large union in New York City—do you think any of their goods are made in sweat shops?—A. I presume some of them are; yes.

Q. (By Mr. C. J. HARRIS.) Are the rooms that these union tailors make their garments in—if not their homes—in about as filthy a condition as any of the sweat shops?—A. They may or may not be. You have no assurance whatever regarding the matter. It was for that reason that, while the manufacturers were to a large extent favorable to a law requiring the licensing of work done in tenement houses, they have been quite antagonistic to one provision of the law, namely, that every contractor, and every manufacturer, and every worker should file with the factory inspector's office a statement of the parties with whom or for whom they work—the manufacturer filing a statement of his contractors and workers, and the contractors filing a statement of their subcontractors and workers. In that

way we found we could trace the work directly to the homes, if it went there, or to the sweat shop, and trace it back.

Q. (By Mr. LITCHMAN.) Would the objection of the employer in that case be from a desire to conceal the fact that he used the sweat-shop work in the manufacture of first-class garments?—A. Yes.

Q. (By Mr. PHILLIPS.) Your system reaches but a small per cent of New York City in the work it is doing?—A. Only a small per cent directly, but (being actively interested in these general investigations) we are able to cover the field quite largely.

Q. Would it not be desirable for the State to enter on such work, to make it more universal, and make appropriations for it—the kind of work you are doing in the large cities?—A. I do not think the State could wisely make an appropriation for the general work that we are doing. I do think that the State could strengthen and improve the interests of the community, if it strengthened, say, its bureau of labor statistics and its factory inspectors' office; if it strengthened its bureau of labor statistics so as to have more regularly paid workers to go from time to time and investigate special evils which were reported to the authorities, in order that they might find out the exact facts. As a rule, of course, the excited or caustic statements made in some of the papers are mere statements, but on the other hand, the deprecatory remarks on the opposing side would be an inducement to a fair investigation of the actual facts; and it could be made by the State, as it would be impossible for the private workers to make it, because if they go into workshops their going is an impertinence, they have no right to go. The State officers can go when they wish. As to the condition of sweat shops to-day, the actual operation of the new law needs to be investigated to see what defects appear. A more extended investigation would be desirable than it has been possible for us to make.

Q. (By Mr. LITCHMAN.) Have the Jewish people any social settlements in New York City, so far as you know?—A. No; I do not know that they have. No; I think not—no settlement that could be called distinctly a Jewish settlement.

Q. You know what I mean—social settlements under Hebrew influence?—A. Yes; there is work analogous to that.

Q. Are they in any sense similar to your university settlements?—A. Yes, to a large extent.

Q. They cover the same grounds?—A. Yes.

Q. (By Mr. PHILLIPS.) You have in your State a bureau, I believe, for the purpose of giving information to the unemployed, have you not?—A. State labor bureau, yes.

Q. Do you know anything in regard to its workings? Has sufficient appropriation been given to it to do effective work along that line?—A. Why, I know something about it; it never has amounted to very much; it has amounted to very little. In order to test it I have sent a few applicants to the office, and I learn now that it has practically become a woman's employment bureau and the men need not apply.

Q. The gentleman before us this morning, from Missouri, spoke very highly of the work done there—that they had found employment for a very large number. He thought it was one of the most important works being carried forward.—A. I myself believe that there is hardly anything for which there is a greater need at the present time than an efficient labor bureau exchange. The supply and demand of labor, it seems to me, is not met to half the extent that is ordinarily supposed. Mr. Jacob Riis records having spent three days on one occasion looking for a painter. On the morning of the fourth day he picked up a paper and saw a record of a painter having committed suicide in New York because he could not find work. We got a number of cases, through charitable societies, of men able to work, and it seems to me there must be a place for them somewhere, but we can't fit them into that place without a great deal of waste effort.

Q. (By Mr. FARQUHAR.) One reading the testimony given this afternoon might think that all garment work in the city of New York was sweat-shop work.—A. They might think that a very large part of it is—distinctly more than half of it—that would be my opinion.

Q. Could you state about the amount of work that is done by what are called sweat shops, and then generally by custom tailors and the factories?—A. I can not make any statement that would be accurate, nor do I know that it is possible to make such a statement, but my own estimate would be that about four-fifths of the work is done in what we call sweat shops, by which I mean either in the private apartment or in the small shop.

Q. Men or women working 10 hours a day and earning \$10 a week—would you call them sweaters?—A. Well, yes. I should not say that that would necessarily define the sweater—the amount of wages or the number of hours.

Q. That would not make the definition?—A. It would not necessarily.

Q. What would be your definition?—A. Those conditions—the question of both hours and wages—would come in; but the kind of a shop and the general condition and the circumstances under which the work is done are also elements. The word "sweat shop," after all, is a very uncertain term. I have seen many attempts to define it, and no one is willing to tie himself down and say it is merely a question of hours and wages.

Q. In the ordinary class of goods that are manufactured can a sweater working 10 hours earn \$10 a week?—A. I should say that he could; yes.

Q. Then where there were three or four in a family, can the children average say \$3.50 up to \$7 a week additional to the \$10 earned by the head of the family?—A. It is very rare to find instances where children are working that way.

Q. But they do in private apartment houses?—A. They assist.

Q. Basting, handling, and everything of that kind?—A. Yes, some; but I do not think that is general to a very large extent. It is not a considerable evil.

Q. When you speak as you do now, and as has been done by other witnesses, abolish the sweat shops—do you think that the term can be made applicable at all?—A. Yes, I think it could.

Q. In what way?—A. Because my idea of the sweat shop is more a question of condition as its essential element than anything else.

Q. The offensive way that labor is contracted, you mean?—A. Well, yes, both condition and the offensive way in which contract labor is made. My belief is that if such a law as exists in the State of New York were thoroughly and efficiently enforced, as it is, for instance, in Massachusetts, there would be a steady reduction of the sweat-shop evil. The work tends more and more to be done in the establishment of the manufacturer, and the evils are thereby greatly lessened.

Q. Take the present sweat-shop population of New York City. There are 12,000 sweat shops there. If you elevate them 20 per cent, won't you admit into the cheaper manufacturing again 20 per cent of the unemployed that must work at cut wages?—A. Well, you would change the condition so that, under your law, efficiently enforced, you would say: We can not interfere with the question of hours and wages directly in any sense, or, perhaps, even indirectly; but we can ordain that no work in the garment-making trade shall be done except under such definite conditions. I do not see, if you elevate the standard under which that work is done, that that would necessarily drive anyone from the trade, because that work has to be done.

Q. How are you going to provide for the tens of thousands in New York and elsewhere who are willing to fill the places, and who must live some way and take the cut wages of the subcontractors?—A. I do not know that that is a problem that the garment-making trade is compelled to solve.

Q. But is it not the great market of the unemployed that keeps the wages down in New York City now?—A. If you would inquire simply as to the question of wages, I suppose it is. I should say it was the inrushing immigration.

Q. Have you any means of regulating the sweating system, other than the police law of the State of New York covering sanitary conditions?—A. Yes and no. I think the law can not regulate wages. That, certainly, I should have to admit. On the other hand, we find this, that wherever the law regulates conditions and elevates the standard, then the condition of the workers being improved, as a fact they more readily combine in their own interests; so they are able to do what the law itself can not do in respect to wages.

Q. Has there not been a gain and improvement in the garment-workers' unions possibly in the last 3 or 4 months?—A. Yes. The agency that operates, in my opinion, to bring about that result, is twofold: First, the inrushing wave of immigration, and, second, the fact that as the union can not inspect tenement-house work it never can keep trace of its members working in their homes; so that one difficulty which the union has to fight is this immigration question, and the other is the question of the law.

Q. So that the remedy really lies in the sanitary laws—to have regulation of the inspection of all sweat shops?—A. Yes; at least half the remedy. I should say.

Q. The unemployed coming in there and keeping the wages down—do you know of any law that can remedy that, or do you know of any way to remedy that by law?—A. Well, the restriction of immigration is one way.

Q. (By Mr. LITCHMAN.) The amount of labor to be done is more or less a fixed quantity?—A. I should say so, yes.

Q. The improving of the sanitary conditions by reason of inspection, etc., would not interfere with the fixed amount, so to speak, of labor to be done?—A. No. There would be an imaginable interference, but hardly an actual interference.

Q. Then by elevating the conditions under which the labor was performed you would not create a vacancy in the personnel of those that perform the labor?—A. Only a very slight vacancy.

Q. Only such as would be natural in the evolution of a trade?—A. Yes.

Q. Then the question of the recruiting of the ranks of labor employed in that industry would be comparatively infinitesimal?—A. Yes.

Q. (By Mr. FARQUHAR.) Under the best arrangements the State of New York through its laws could make for the regulation of these sweat shops, and though these regulations from a sanitary point of view were both conducive to the health of the employees and to their betterment as far as the wages go, would it not be natural for those who are in the competitive market for these cheap goods to establish sweat shops in other territories near to New York, where they are not under the New York law, so that the sweaters themselves would not in the long run be benefited?—A. I think we look far enough to see that there is that danger, and yet at the same time when we raise that question I think we should turn back to the State of Massachusetts and see that Massachusetts, as the result of its law and its strict standard, has still been able to maintain its position in the market, because, as I stated a few moments ago, the knowledge of its higher standard has made its goods in greater demand, so that so far as that is concerned there has been a compensative advantage. On the other hand, in so far as the very large trade of New York is concerned, undoubtedly there would be a certain loss and a certain passage of the sweat-shop business into another State. Now, then, the result of that would likely be one of two things—either the evil would be concentrated in that other State and would exist as a running sore there; or, secondly, as a result of the change we would simply add one more State to the list of those where work was done under good conditions. The fight could then be carried on in New Jersey as carried on in New York; but if it could be arranged so that each State could act in harmony through legislation on this subject, then the elevation would be uniform, and there being still a demand for that work, as there unquestionably is, the country would be benefited and nobody seriously harmed.

Q. (By Mr. KENNEDY.) There seems to be some fear that this evil can not be confined to the State of New York—will be driven elsewhere. I would like to ask if you do not believe that public sentiment and the law would cure this evil in the State of New York as it is practically cured everywhere?—A. No; I do not.

Q. Would it not go a long way toward doing it?—A. I do not know; I do not know how many sweaters would go over to New Jersey.

Q. Would not the public sentiment that would chase it out of New York be very apt to chase it elsewhere?—A. It would be a step of progress, undoubtedly.

Q. If you had this evil to combat in a New England city, or in the State of Ohio, or in Indiana, wouldn't you be much more hopeful of accomplishing your purpose than you are in the State of New York?—A. To be sure.

Q. (By Mr. LITCHMAN.) If you succeeded in reaching this evil in New York City it would be the result of combined forces, uniting in what may be called a properly educated public sentiment against the evils complained of?—A. Yes; I think so.

Q. If thereby the evil should be cured so far as New York is concerned, and it is driven into another State, could not that same healthy public sentiment be created in that State to suppress the evil there?—A. It might; but I emphasize this danger, for the reason that as soon as we get our sound laws passed in New York State the manufacturer whose trade is at least immediately affected rises up and says: "We don't care what the ultimate solution may be, but the immediate solution is injurious to us," and hence he exercises his influence either to prevent the passage of the law, or, what is sometimes more easy, to prevent its enforcement.

Q. (By Mr. FARQUHAR.) Do you find any large wholesale dealers in clothing and haberdashers' goods anxious to abolish this sweating in New York?—A. The large manufacturers all say that they are.

Q. But have they ever taken steps to go to Albany and vote for remedial legislation for that?—A. The large manufacturers favor this license law, only, as I say, they did not favor the enforcement of this condition.

Q. Is it not a fact that the cleaning-out laws in Massachusetts have driven five-eighths of the sweating business into New York from Massachusetts?—A. I dare say that is true.

Q. (By Mr. C. J. HARRIS.) I did not understand you to say that these sweat shops were an evil?—A. I intended to give that impression; that they were an evil.

Q. Do I understand you to say that you would blot these all out if you could, regardless of the hardship it might bring upon these people, and without provid-

ing them with some other means of subsistence?—A. Well, I should not feel that I had to provide another way of subsistence, because if the sweat shop, with its attendant evil under the present condition, was abolished, the garments would have to be made and the same workers would be demanded. There are many workers, for instance, who this year may work in sweat shops, and last year were working in factories; in clean, well-lighted, and wholesome work rooms, and who worked only 10 hours a day.

Q. How are you going to take the people right from Italy, or the ignorant pauper classes of any country, and make them good citizens and put them into fine factories where they are earning large wages without going through a certain apprenticeship something like this sweating system?—A. The fact remains, a very considerable number of the people who come directly from Russia, Poland, and Italy do go immediately into the factories. I have never heard any manufacturer say that he makes a test, for those who go into the factory, of length of residence and experience in the work. In proportion to the number of workers he wants he takes them indifferently, according to their skill and attention to business, whether they have been in sweat shops or not. But he says he can't continue the factory at this time under the competition of sweat shops.

Q. A great many of them work in the coal mines of Pennsylvania, and their methods of living are nearly as bad as these conditions in New York, are they not?—A. I imagine so. I have never visited the mines.

Q. (By Mr. CLARKE.) You consider that sweating is preferable to unemployment?—A. Well, I do not know that I should phrase the question exactly in those terms, because I should not admit that sweating was a necessary evil.

Q. You regard it as an unmixed evil?—A. No; I do not regard it as an unmixed evil, but I think it has an inevitable tendency to bring the worker down rather than lift him up, and deteriorates him in mind, body, and character.

Q. Granting that it may be better than unemployment, you still think it is superseded by a better system?—A. Yes.

Q. (By Mr. LITCHMAN.) You have indirectly stated that immigration was an important factor in this matter. Now, will you kindly give to the commission your ideas upon immigration and necessary legislation in relation to it in a general way?—A. Well, I will make a very brief statement on that subject, because I know there is more material on the subject of immigration than on the sweating system. The first fact I would like to notice regarding immigration is its effect on the character of the immigrants where large masses of them come over in a body, and settle in one quarter of the city. We all know, I think, that the question of the poor quarter of an American city is the question of some of our foreign races. I have not found a poor quarter of any American city which is an American quarter. Now, then, what one does notice when he comes to these foreign quarters of an American city is that the immigrants have come, say, from Russia, Germany, Poland, and Italy, and have settled in this country in a mass. They form an undigested lump. That lump, because it is a lump, is very much more slowly digested in the American life than it would be if it were more scattered. The Italians, as I stated, don't, in a large number of cases, adjust themselves to American ways at all. Among the children there is what I believe Mr. Brace noted some 20 years ago—a tendency to moral degeneration which almost always appears where large masses of people pass from one country to another. They have abandoned compulsorily a certain amount of the moral traditions of their own country, and they have not yet adjusted themselves or learned to respect the moral traditions of the new country or to know those conditions; so there is a certain relaxation of the feelings of moral obligation, and a delay for a considerable period in gaining a new hold of moral principles and moral ideas. Where we have a mass of population, as we have along the lower east side, where the Jewish people are, or on the west side, where the Italian population is, and the lower west side, where the Syrian colony is located, the work of assimilation and of Americanization goes on very slowly. Now, what we see in these localities—the problem that astonishes those of us who are workers—is the general lack of realization of the importance of the work of assimilation and Americanization. I have been accustomed to take as a figurative illustration the treatment of Alsace-Lorraine by the Germans when they annexed those districts to the German Empire. Instead of sending, as Russia did to Siberia, their inferior or degraded officials, the Germans sent their best officials, so all work of assimilation which they realized must be done with that mass of people would be done under the wisest and most intelligent administration possible. We have substantially the same problem, which arises through immigration, in this country. Large masses of foreign populations form substantially foreign colonies in our midst. In some of our quarters, for instance, the regular

holiday is Saturday and not Sunday, and garment workers, not by hundreds but thousands, work on Sunday, and the language is German or the Jewish jargon in one section and Italian in another section. Now, it would seem a wise and intelligent policy on the part of the American National Government and State governments and the city governments to imitate Germany by sending the best and strongest forces to work in those quarters of our large cities. Instead of that, what do we find now. Take the public schools as an illustration. We find that the brightest teachers as a rule seek the uptown schools. We find the best school buildings in New York are in the most comfortable quarters of the city. We find the best school equipment will be in connection with those better schools; and though you find exceptions, where teachers of the very best caliber will as a matter of personal self-denial go into the poorer quarters of the city, nevertheless you do not find any steady policy in any city I know on the part of school superintendents to send their strongest teachers and principals to these districts where the work of education is going to be carried on under the greatest difficulties, any policy to see that the very best schoolhouses are established, where the schoolhouses will be about the only clean, sanitary, and well-lighted buildings in these districts. We do not find any steady policy of seeing that those schools are supplied with the best material for work, so that the school shall be at its very best. In all the other departments of our State government this state of affairs is found. I do not reflect on the officers, because there are in each case exceptions, but as a rule the better officials operate in the better districts, and there is no systematic, intelligent, steady policy pursued of sending the best officials and pursuing the most careful work of municipal education and municipal reform in the districts where there is the least opportunity, the least privilege, and the greatest need; and the failure of our government to do this seems to me the most lamentable failure we are making with the poor at the present time. I feel that that being our policy we get a very strong emphasis of the need of restricting immigration so that we shall not receive these people in the overwhelming masses in which we are now receiving them. We apparently have received more than we can easily manage, and I will state that our poor quarters are foreign quarters, and that the question of our responsibility to strangers is not a question of a few hundreds or a few thousands merely, but in each city it is a question of a very large portion of the total population. It is fairly evident in New York and in all our large cities to-day that we have a larger amount of foreign population under our tutelage than we are capable of caring for, and that it would be very much in the interest of the general progress of our community and the improvement of civic conditions and of the welfare of those who are already here if there could be a limitation of immigration, so that, as one of the commissioners has stated here, there would not be each year a fresh avalanche thrown upon us just as we are recovering from being choked by a previous avalanche. We do not have time to get one mass adjusted and settled and arranged before the other comes in.

I have spoken of the injury done to the garment-making trade by the Jewish immigration. The Jewish population, as I find it, is a very intelligent element. It is astonishingly industrious, astonishingly ambitious for education, and during the past 10 or 15 years the work done by the people themselves to rise out of the mire into which they have been plunged has been remarkable. The trade unions become a little stronger and the general conditions have made some slight progress; but now we find the Italian community, which until within 5 years had not to any extent gone into the garment-making trade, rushing in and throwing itself on the necks of the Jewish garment workers before the Jewish garment workers have sufficiently established themselves so they can cope with the dangers and evils of this new immigration; and, as I think you will see from the statistics I have presented to you regarding the condition of the houses in which the Italians work, the Italians are going a little below the conditions established by the Jews, crowding the houses more than the Jews have done, and creating unsanitary conditions worse than those that existed where the Jewish population was working. The example and illustration of the Italian population to-day in our large cities is a striking case of the degeneration that has come into the garment-making trade, and into certain general conditions of tenement-house life, because of the too speedy rushing of another large mass.

When it comes to the question of altering the immigration laws, I do not feel that I care to make any statement. I feel that it is more strictly within my province to call attention to the condition and emphasize my own objection to the condition. I have not given special attention to the matter of restriction of immigration, and I do not care to speak on that point.

Mr. Chairman, I would like to make a very brief supplementary statement. I

would like to generalize, first, that in our poorer quarters there is a most unfortunate lack of equality or opportunity as compared with the opportunities offered to the better-conditioned classes. I have been impressed in my residence of 7 years in the lower quarter of New York City that while the material conditions are most unfortunate, and the victims of them are great sufferers, nevertheless the moral and intellectual poverty of the people is even greater than the material poverty.

There is in the poorer quarters of our cities an utter absence of privileges which help to make life enjoyable and wholesome in other quarters of the city. I have called attention to the defect of education. I should specify also the defect in the supply of lavatory privileges. I have called attention to the evils of the pawnshop and the disadvantages to which the people are subjected by the pawnshops. I might also name the general disadvantages which appear in all their commercial workshops.

We at the university settlement have our own house, and there are 10 of us living in that house. We can go to a grocer's establishment, a butcher's, or a general-supplies establishment in another part of the city and get a better grade of goods at cheaper rates than the people of our quarter can buy in their quarter, and we are therefore in better circumstances and in better condition at a less price than are the people about us—our neighbors of the district. I call attention to this fact because I want to emphasize the unfortunate condition of those whom we are trying to Americanize, and whom we owe it to ourselves to Americanize.

I would like also to call attention to the Italian community. It is said that there are from 150,000 to 200,000 in the Greater New York. I have noted the sweat shop as one evil appearing in that community. The private bank is the second evil generally known and recognized. A man establishes a small private bank; he dictates the correspondence of a certain number of immigrants whom he knows and manages their affairs for them. Suddenly some morning they find he has gone; he has left with all the deposits. That bank is a peculiar evil preying upon the Italian community. The Italian Government, I am informed, has gone so far as to ask its agents to make an investigation of that evil, and is considering the establishment of a branch of the Italian Bank in New York City. The reason the Italian Government is doing this is because a part of the Italian population sends back its money to Italy, and thereby helps to pay the taxes of the Italian Government. If the Italian Government is willing to do this in the interest of the minor part of the Italian population in this country for their own gain, it seems to me that we, in the interest of the major part, who are going to become permanent citizens of our country, have still far greater considerations at stake.

The third evil is the padrone system, the small subcontractor of labor, an evil which is so generally known that one even hesitates to name it.

I wish to call attention to those three evils. The evils spring up in this country because the people come as I have said in large masses, utterly ignorant of the conditions in our country, and subject to exploitation by every villain of their own race who is willing to take advantage of their ignorance and inexperience.

I would like to add a word in regard to the supply and demand of labor. I think many of us feel that it would be an advantage if we could in a measure divert the stream of influx into the cities back into country life and country work. I have made great attempts on different occasions to get men to go into the country, and I find as one reason why they do not go the fact that they prefer to live in the cities rather than in the country. I find another reason, which we could meet if we would, namely, a feeling that if they go into the country they are lost, and if they stay in the city they stay among friends. There are no efficient labor bureaus connecting the city and the country, so that when we have a man or men whom we want to go into the country we always find it extremely hard to get them to go, though I am perfectly sure there is probably in the right place a demand for labor. The workers know if they go into the country and then are stranded their condition is much more calamitous than it is in the city, and it is my belief that this question of the employers' bureau should be carried out to a much greater extent than it has been carried out up to date. There should be careful, well-arranged, systematic communication between the city and the country, so that the wants existing in any one part of a community may be quickly known in another part of a community, and suitable agencies in the places where there is a supply might easily communicate with the places where there is a demand. We have had a number of voluntary employment agencies in our cities, and many of them have failed. I had word last week that one of the largest private employment agencies in the city, which is philanthropic, was going to close. My impres-

sion of the cause of that closing is this, the tendency of all such employment agencies is to run down. That is, they start and say, We desire to fill places of rather high grade. If a general bureau is established the unskilled labor rushes in, and the result is that the skilled labor and the clerical class very quickly shun that employment bureau, because they think they are lowered by connection with it; and if they attach themselves to that bureau they think they give the impression that they are hopelessly and completely stranded. It seems to me that our bureaus have failed to consider the feelings of the people, and an improvement could be made if they were to guard the work of the bureau. If, for instance, in a city like ours, where we have large agencies, they would have one bureau, and one division where only unskilled labor would be handled, a second division where all classes of mercantile labor would be dealt with, and a third division where unskilled labor would be dealt with, and in that way recognize the aristocratic feeling which exists among the workers in three different grades, and which to a certain extent it is necessary for one in the upper grade to maintain if he is to have the respect of his employer and fellow-workers, the employment agency, I believe, would become a much more useful factor than it is to-day. That it is necessary to more carefully study the question of bringing the supply and demand of labor together, and of providing better agencies by which the supply and demand shall be brought together, I most strongly believe.

Q. (By Mr. CLARKE.) Have you thought how that can be done?—A. Only to the extent that I have indicated. I should say if it is going to be done by the Government in any large way, it would have to be done by the Bureau of Labor Statistics. In New York to-day we have a small employment bureau as a fifth wheel to the coach of the bureau of labor statistics, and, as I say, it becomes simply a woman's employment bureau. It is an interest of sufficient importance in itself to be an independent institution.

Q. Is it your idea that the State government should create an employment bureau and pay all the expenses of it, and that private employment agencies should be done away with, as they probably would be by that kind of competition?—A. I should not be prepared absolutely to recommend that. But I think that a State bureau of labor which would do part of the work, operating with the assistance of private bureaus of labor, and encouraging and aiding them in their work, would very much strengthen the effort that is now being made, and which at present seems to be largely a failure. I would start the State bureau largely as a bureau of information, requiring it to cooperate with all private bureaus, and then let it gradually and somewhat cautiously develop itself.

Q. (By Mr. PHILLIPS.) Are there not a number of persons running private bureaus who take money from persons seeking employment and who do not make a just or fair effort to get them employment?—A. There are a great many of those in New York City, which are purely dishonest. They have a regular arrangement, or have a certain place where labor goes, and they supply a man with a place, and then they take a fee for getting him the employment, and the man keeps the place for a week or two weeks, and then he is discharged; and the next one comes in, and so on. I have known a number of cases of that kind.

Mr. PHILLIPS. Have you any other statement that you would like to make?

The WITNESS. I have not.

(Testimony closed.)

WASHINGTON, D. C., November 17, 1900.

TESTIMONY OF MR. JOHN P. LEO,

President Builders' League of New York City.

The commission met at 10.45 a. m., Vice-Chairman Phillips presiding. At that time Mr. John P. Leo, of New York City, president of the Builders' League of New York City, was introduced as a witness and, being duly sworn, testified as follows:

Q. (By Mr. CLARKE.) Will you give your name and post-office address?—A. John P. Leo, 74 West One hundred and twenty-sixth street, New York City.

Q. Are you president of the Builders' League of New York?—A. I am.

Q. What is the builders' league and when was it formed?—A. It was formed about 6 years ago, and is composed of men engaged in the building trades in New York City, a necessary qualification for membership being that the individual or firm proposed shall be an employer of labor in the building trades, of good reputation, and generally desirable in an organization of that kind.

Q. Does the league embrace men in all the building trades?—A. In all the crafts; yes.

Q. What is the membership?—A. About 300 firms and individuals.

Q. (By Mr. PHILLIPS.) About what per cent of the builders of New York are embraced in your league?—A. We have on the rolls, I should say, from 50 to 60 men who are general master builders, general contractors.

Q. What per cent of the master builders would that be of the city of New York?—A. The Builders' Club—another organization of builders—has 25 or 30 per cent, and we probably have the same number, so that between the two organizations there is probably 50 or 60 per cent.

Q. (By Mr. CLARKE.) Has there been a labor difficulty in the building trades since your league was formed?—A. They are constantly occurring. There have been many difficulties. There have been strikes, and in several cases lockouts.

Q. Is one of the purposes of your league to avoid or to speedily settle labor difficulties?—A. The reasons for its existence are contained in article 1, section 2, of the by-laws, and reads as follows: "The object of the league is to be an incorporated body under the charter of its organization, in order that it may be a body responsible to those with whom it may have business; to establish a general and good understanding on the part of its members, just and equitable principles in all business done within its limits; to acquire, preserve, and disseminate business information; to arbitrate, adjudge, and adjust all differences or misunderstandings between owners, members, and journeymen; to enhance its membership and contribute in all reasonable and legitimate ways to the success and prosperity of its members in business matters, individually and collectively."

That is the general object of the organization. Now, in regard to our dealings with the men, we have a provision providing for the appointment of what are known as stewards in the different crafts, and they are to represent to our organization the general desires and wishes of the men in that craft, these stewards to be appointed by the employers, and the men so appointed to be journeymen who are thoroughly in touch with their own members. We are sorry to say that that did not prove a success. It met with opposition from the unions. We found that the men whom we were willing to have accept—men who, by their experience or the fact of their being level-headed men, would be suitable arbitrators—we found that they would not be *personæ græte* to the organization.

Q. (By Mr. LITCHMAN.) Who appointed those stewards, please?—A. They were appointed by the organization.

Q. Your organization?—A. Yes. But that did not please the idea of the unions, although we were willing to appoint any one of a number. The idea was repugnant to them, as it would interfere with the work of the walking delegate, who was the authorized representative of the various unions.

Q. (By Mr. FARQUHAR.) Were those stewards in the character of walking delegates themselves, as far as your organization was concerned?—A. No; our proposition simply was that men who were a long time in the business, men who were old journeymen and who had been through all sorts of troubles and strikes and knew what it meant to both employer and employee—those were the men we sought. But that was not a success.

Now, you ask a question, question 5, on page 4 (referring to commission's schedule of inquiries as to relation of employers and employees), relating exclusively to organizations of employers, as follows: "What rule, or practice, if any, has your organization as to assisting its members in labor difficulties, whether by sympathetic lockouts or otherwise?" I answer: We call a general meeting, and, after full discussion, carry out the will of the majority by assisting in furnishing non-union men. Now, the latest instance of that was in the case of the journeymen plasterers. The journeymen plasterers made certain demands upon the employers, and, among others, that the men should select their own foremen. The employer had no voice beyond signing a paper prepared by the union, which asked the privilege of appointing John Blank as foreman on a piece of work. They insisted upon that, and insisted so strongly that they would strike, and did strike, on each employer's work where that paper was not signed. The application was granted by a few, but a large majority of the employing plasterers decided not to sign the paper. Our organization does business generally in the upper part of New York City. The Master Plasterers' Association have their headquarters in the lower part of the city. The custom had been, when there was a strike in that particular trade, for the men who remained at work in the upper part of the city to support the men who were on strike in the lower part of the city; so we decided to act jointly with the Master Plasterers' Association, and that was the only instance where we had what was practically a lockout. We simply said if the jobs in the lower part of the city are struck, we will take a vacation in the upper part of the city; and we did so, and in 3 days the strike was over.

There have been instances in our meetings where an individual firm would report trouble by reason of a sympathetic strike. That, as a matter of fact, is the great trouble that we have in New York City—sympathetic strikes. The trouble is not so much with the individual or with the separate organizations; but just so soon as there is a difference, oftentimes without any warning, men leave the work.

Q. (By Mr. LITCHMAN.) Is that any different from your sympathetic lockout?—A. Not at all. Of course, we were in that; it was simply a case of fighting fire with fire. But I mean that was the only instance in which we did that. The value of the weapon is undoubted; the fairness of the weapon we question very greatly. As a matter of fact we have more trouble with the plastering craft than any other of the trades. But the weapon is an unfair one and an improper one to use. One craftsman who was under a high penalty to do a certain portion of work—his men walked out. "What is the trouble?" "Delegate told us to." "What reason did he give you?" "None." "Did you ask any?" "Yes; simply stopped work." Then it would be the province of the man whose men had struck to go and hunt up Mr. Delegate and find out the reason. Perhaps some other craft had a nonunion man at work, refused to lay him off, and everybody else went out.

In answering your question 9, on page 3, which reads as follows: "9. Will you express your general opinion as to the working of joint agreements, conciliation, and arbitration, and as to the best methods of settling labor disputes?" We say: "If both employers and employees will select as arbitrators or conferees level-headed men, strikes and lockouts will be a thing of the past. We believe that, and we are willing to enter into that at any and all times. We do not believe it a good thing for State boards—we do not believe it a good thing for national boards to do; but we think that it should be something that should be impressed upon the minds of the men themselves."

One instance of injustice that I will cite is in regard to one particular craft; that is, the granite cutters of New York City and State. In 1893 a bill was passed called the Tobin law, which provides that any and all granite which is used on municipal or State work in New York shall be dressed on the place or at the place where used. Now, we suggested that that was an improper measure to remain on the books, and 2 years ago discussed it before an assembly committee. The statement was made that 700 or 800 granite cutters were interested in this particular law. The records of the Bureau of Labor Statistics, the sworn record by the secretary of the organization, showed that there were 85 members so reported as being granite cutters in New York City. And as that law stands to-day, since we have not the machinery in New York City, there is not demand enough for it to do the turning of heavy columns and that sort of thing. The use of granite is pretty well thrown out of State and municipal work. The endeavor to repeal that law brought the notice of the representatives of the Central Federated Union to the fact that we showed that it was for their benefit, on their own report of 85 men, yet it was impossible to have the bill reported providing for the repeal of that law, and it stands on the books to-day.

I have with me copies of the laws affecting labor that were proposed to the last assembly of the State of New York. These are proposed laws, and I will leave the copies with you, if you please; and they will show you the idea. What we objected to more than anything else was the form of the employers' liability law which was offered. It passed the State senate but died in the assembly. It was offered by Senator Ford. As we found the law it was unjust and unfair and would simply make a scapegoat of an employer. If the name of a man was on his pay roll and the man was hurt, it meant that the employer should pay. We offered to compromise with the men on the Massachusetts law, but that was refused. They insisted that this should go through, or none.

On advice of counsel at the time and on reading over carefully the law as it has been passed in Massachusetts, we were very glad indeed and were very willing to have that law go into effect.

Q. (By Mr. FARQUHAR.) What are your relations to the stonecutters and their union?—A. In regard to the stonecutters, there was trouble in the stonecutting trade some 3 years ago, when there was a difference between the employers and the employees which resulted in a strike. The strike lasted 10 or 11 weeks, and was finally settled by the employers giving way and paying into the treasury of the union in fines an amount which I am informed and believe was nearly \$12,000. At the present time an agreement exists between the master stonecutters and the journeymen, and both sides I believe, are living up to that agreement.

Q. It is for how many years?—A. This agreement was signed, I think, about a year ago. They had existed before that. There had been harmony for 8 or 10 years. An agreement was made each spring, but the unfortunate part of the

agreement was this, so far as the employers were concerned, that the agreement would end on the 1st of May, and the new agreement must be signed on the 1st of May. At that time the yards were generally full of work for the summer and it was hard for the employer to stop. He could not very well stop to discuss the question; it was a matter where he could simply make the best terms he could and then sign a new agreement for the year. The employers suggested that the time the agreement should end should be February, so as to allow them time to prepare for the summer's work; and that in fact brought about the trouble. As I say, the strike continued for 11 or 12 weeks and was finally settled by the Master Stone Cutters' Association giving in fully to the demands of the men, and in addition paying into the treasury of the union about \$12,000.

Q. The objection of the journeymen to the February or March agreement was simply because you intended to make the agreement under slack work, and they intended to get the advantage of the rush work?—A. Yes; that is correct. And then there was a difference as to the machine men—that is, the men who work in the yard on the various machines. There was a question as to what time the cutters would allow them to work and as to what rate they should be paid. In regard to the bricklayers, I would say that there is very little trouble with them in New York. The present rate of 55 cents an hour, which they receive according to the agreement, is a fair, honest rate. They are entitled to that, and I question very much if, in all fairness, it should not be 60 cents an hour. They do not work over 50 per cent of the time—they can not—and the average rate of wages really would amount to 30 or 35 cents an hour for a man if he could be employed all the time that he is permitted to work by the weather. Then his work is hard work, laborious, and oftentimes he takes very great risks, and he is entitled to full recompense for it.

Q. If you did give him an advance, you would provide for the advance in the contract that you would make?—A. Exactly. I would say, too, that many of us are merchant builders in New York who simply buy our property and improve it and offer it for sale, and make no objection to the increased rate to the bricklayers for the reason I have stated.

Q. (By Mr. LITCHMAN.) There is no objection on the part of your organization to an intelligent system of arbitration between the employer and the employee?—A. No; rather, we encourage it.

Q. Prefer it?—A. Prefer it by far.

Q. (By Mr. FARQUHAR.) In the bricklayers' union your means of settling disputes by agreement is something like the Boston arrangement?—A. I believe it is based on that. I know that they have an arbitration committee, and I do know that no strike is declared until after the arbitration committee declare that they can not agree; and if there is a question of wages, or time, or anything of that kind, it is usually settled by the bosses in favor of the men. The bricklayers have an intelligent, sensible agreement with the employers at the present time.

Q. (By Mr. LITCHMAN.) Do you notice any growth of sentiment in favor of such arbitration agreements in New York?—A. Yes, I do; and I notice that among the journeymen whom I have talked with on the work. But the trouble is—we will take a craft, for instance, that has 600, 700, or 800 union men. Out of that 600, 700, or 800 men you will find that, perhaps, 30 or 40 will attend the meetings, and they attend every meeting. They elect the officers, and they appoint the delegates, and whenever there is any work to be given out, when work becomes scarce, that 30 or 40 are always provided with places as a reward for faithful service at meetings. And you find also that the journeyman (I will not say this is true of all the best of them, but I will say it is of a large majority of the best of them) does not go to the meetings; he simply does whatever the union dictates; he carries out the order; he must do that, and he does that; he purchases his peace at that price; he can not declare that he will not stand for so and so, though he would like to. And when he does get up down there—men who are members of our organization now and who have worked at the trades as journeymen will tell you that if a man rises and proposes to object, the language used to him is sometimes terribly shocking; he is threatened with bodily harm.

Q. Has not the custom of appointing business agents, as they are called now—they are not called walking delegates—has not the custom of appointing business agents arisen from the fact that the man appointed on a committee, in days gone by particularly, invited his discharge by reason of service on that committee?—A. I do not think so, for the reason that I know men now who were walking delegates 3, or 4, or 5 years ago.

Q. I am not speaking of that. Did not that custom come out of the fact that previous to the selection of walking delegates, a man who served on a committee directly invited his discharge by reason of that service?—A. No, I do not think

so; and if you will allow me to suggest, I think it would be better for any particular employer to have in his employ, and be persona grata to the walking delegate, the individual who was to act, because he would naturally have a man who was with him.

Q. (By Mr. FARQUHAR.) Are not the duties of a walking delegate or business agent so well defined now by the council and by the trade union itself that you know exactly how to deal with the man? His authority is limited simply by what they have given him, and he can not overstep that without instructions afterwards through the executive committee or through the body controlling him?—A. That is correct.

Q. Is it not an advantage now to have the more intelligent system of walking delegates in place of the system you had before, when it was a matter of a man's own capriciousness whether there would be a strike or a sympathetic strike in a body?—A. I do not think it is an advantage, because, in addition to the fact that he had his particular union to support him in his contention, now, by reason of the conference and by reason of the agreement and the board of walking delegates, he has the other unions as a club. That is the effect that it has.

Q. Do you not think it has been quite an advantage to the union to have these organized delegates? Would you not have such a man employed yourselves if you could find one that would be equally as advantageous to your own business as he is to the union?—A. In the same way as a foreman?

Q. Yes.—A. We employ now a foreman, but so far as the foreman's duties are concerned, why, practically the walking delegate for the union is a foreman for the men.

Q. He meets the union community there, and of course it is influenced accordingly to his own instruction?—A. Yes; undoubtedly.

Q. (By Mr. CLARKE.) But your foreman does not have anything to do with another man's work, does he?—A. No; he has that particular job that he has, whereas the walking delegate is a free lance and a free agent, who goes from one job to another. I will tell you an instance, and not an uncommon one, in regard to an action of a walking delegate. He will go on a job and ask to see the card of many of the men. Some poor fellow will be out of work, perhaps, and behind on his card. Although the man would promise and say, "I will promise to pay on Saturday night as soon as I receive my pay," out he goes. It is rather a hardship; he has no opportunity. Perhaps the delegate will say, "We have a man who has paid his dues, and we do not want a fellow who has got no money," and out the fellow must go unless he pays a fine.

Q. (By Mr. FARQUHAR.) In your own organization you have black sheep?—A. No; not a single one.

Q. Then you are very happy?—A. We are.

Q. Is it not a fact that you have men in your organization that are scamp workers, unfair men, underhanded in obtaining contracts, municipal and otherwise?—A. We have provisions for correcting just such an abuse by bringing a man to trial.

Q. What is the difference between your discipline and the unions', when you apply it?—A. The difference is this: We will always give a man a fair chance for hearing, and we will give a man a chance to make good. But the union, and the delegate in the case that I have stated—it is simply a case with him to stop work because the man has been unfortunate. If our member is unfortunate, we would rather help him than crowd him; but in the other case, if he is unfortunate he must be still more unfortunate, because his means of livelihood must be cut off and his means of paying off the amount that he owes. That is the difference.

Q. (By Mr. CLARKE.) I would like to ask the question whether these various unions have a building trades council in New York?—A. Yes; the unions have.

Q. Do you have any dealings with the council, or are your dealings with the unions direct?—A. Direct. We do not deal with the council. As an organization we do not deal with the unions, but the members. Our organization being a peculiar one, combining all the crafts, the men who are members of our organization in nine cases out of ten are members of the masters' organizations, and they deal with the unions of the men.

Q. (By Mr. LITCHMAN.) Have you given any attention to the question of so-called compulsory arbitration?—A. None, except in a general way.

Q. Could you give any expression of opinion in relation to it?—A. No; I would rather not express an opinion beyond the general one that if there were some provision of law, if you please, under which the unions and the employers' organizations would settle questions by arbitration rather than by force, it would be a thousand times better for the men and a thousand times better for the employers.

There was one question you asked [reading]: "No. 11. What is the practice of the labor organizations as to uniformity of wages? Are members allowed to

receive more or less than the union scale?" I said, "Never less than the union scale, and generally as much as possible." I will qualify that by saying that in the plasterers' organization they will not permit a man to receive more than the standard rate of wages. That is a peculiar state of affairs, but it is a fact nevertheless. If it is found that an employing plasterer has given a man his envelope for 6 days' work containing more than \$27, the man must explain to his union why that is, and he is looked upon with the gravest suspicion. That is a fact. That is the only instance that I know of where that is objected to.

Q. (By Mr. KENNEDY.) I should like to ask a question in regard to the employers' liability act. I have read the Massachusetts act, and I find that the employer is responsible for any injury that may occur to the employee by reason of negligence on his part, or any one of his employees, and the employee may recover the sum of \$5,000, or his heirs, or his representatives; and that it does not apply to farm labor and domestic service. I would like to ask wherein the proposed law of New York differed from the Massachusetts law.—A. I can show that very readily. In the first place, there is an unlimited liability.

Q. There is a limit in the Massachusetts law of 30 days, I believe.—A. Yes; and there is a limit in amount in the Massachusetts law.

Q. Five thousand dollars?—A. Yes. In the law as proposed by Senator Ford there was absolutely no limit. The theory of this law was simply that you could set up no protection; you could make no contract by which you could pay an extra amount to a man by reason of unusual risks, for which he would accept those risks; you could not make any such contract with him. I think under the Massachusetts law that would be permitted, but under this it is absolutely forbidden. If there was a particular risk in work, for which you were willing to pay more to have it done, and which must be done, that contract would be null and void if any injury occurred to the man.

Then another instance. No matter what precaution you might take, the act of a fellow-servant would render you personally liable. Now, I can bear that out by one illustration. Two years ago I was building on a piece of ground, 75 feet front, in the upper part of New York. I there had a hoisting machine to convey masons' material to the upper stories. I came to the job one morning and found that the engineer was so drunk that he could hardly stand, and how he ever, until the time I had gotten there, had run the machine, I could not understand. I discharged him at once, sent him away at once, and complained to his organization about him. Their representative came up to the work and the man came with them, and the bricklayers who were on the wall bore out the fact that not alone had he been drunk that day, but had been drunk several days while standing by the boiler. I could never have a response from the union, although I had written a courteous letter to the union calling their attention to the facts, believing it was for their benefit to know what this man was. Three days afterwards I saw him at another job running the boiler, although they sent another man to me. I mention that illustration to show that under this law if, owing to that man's negligence, he had started that machine and any person had been hurt in the upper or lower part of the building, as he was my servant and I was the employer, under this law I would have had no recourse but to pay. It was my duty to see that the man was in proper condition, although I had no jurisdiction over him. He was sent by the union, of which he was a member, the job assigned to him, and yet I was fully responsible under this law for his act, and I could not in any way justify myself or claim exemption. You will grant me, I think, gentlemen, that is hardly a fair law to put on the books.

Q. (By Mr. LITCHMAN.) Did not that law grow out of the fact that the decisions of the courts had been strained to the utmost extent on the theory of contributory negligence and negligence of fellow-servants?—A. It has so been claimed. And I would say this further, that I believe when the bill was prepared first it was to hit the railroads, and there was no intention whatever of hitting the other employers; but unfortunately they could not make a special law, and they must make a general law, and that put us all in the scorp net. We realize that a man is entitled to certain protection. We take out accident policies when we start a certain piece of work, and we protect ourselves by taking certain insurance by which the insurance company agrees to protect us in case of accident; and we encourage the men to take out accident insurance. It is hard work to get a man to do it, and yet in nine cases out of ten we are not responsible for the accidents, and in all fairness 60 per cent of the cases are due to the man's own fault. For instance, we send a man to go and build a scaffold and tell him where to find his horses and planks, and tell him to get 2-inch plank, and he will go and get 1-inch plank, although he knows it will not be strong enough, but he says he will take the chances, and there is an accident. There is plenty of scaffold there and plenty of horses, but we pay the bill. That we believe is a trifle unfair to us.

Q. (By Mr. CLARKE.) You say that 60 or 70 or 80 per cent of the cases of damage are due to a man's own negligence. About what proportion are due to the contributory negligence of employees?—A. I am inclined to think in a general way they are due to his own negligence or that of his fellow-employees. Though there are certain cases, and just cases, where men are sent to do things that they should not have been called upon to do.

Q. (By Mr. FARQUHAR.) Have you any agreement with the hoisting engineers there?—A. No; there are four or five firms in New York that control the hoisting industry, and there is an agreement between the union and the employers. This man that I spoke of, who acted in the manner that I have described, was a member of the hoisting journeymen's association.

Q. (By Mr. LITCHMAN.) Do the laws of New York, so far as you know, provide for the examination and giving of certificates to engineers?—A. Yes.

Q. The same as the Massachusetts law?—A. I think they do. That is, each person, to run a boiler, furnish power, or high-pressure system, must have a license; and that is issued by the police board after an examination of the applicant by the board.

Q. The same result as under the Massachusetts law. There it is under the inspection of the State police.—A. That is the State police, and not, as we have, municipal police.

Q. (By Mr. FARQUHAR.) In any of your strikes in New York there, have you invoked the aid of the State board of mediation and arbitration?—A. I think not.

Q. Your association never has?—A. No.

Q. As a master workman yourself, do you think that trade arbitration by the employer and the employee, of the same trade, is the proper way to arbitrate every disagreement in respect to hours and wages?—A. Yes, that is undoubtedly the best way, because they can get at the question with better understanding than any outside arbitrator. I do not think that the State board has ever helped very much. I will say that frankly. While they have worked very hard, their effort has been regarded with suspicion, and they have been accused of leaning to one side or the other; and the party against whom they decide feels, "Well, they did not understand the question." But the manner in which an adjustment can be best arrived at is by the workmen and the employers coming together on a fair, honest basis.

Q. (By Mr. CLARKE.) Have you any objection, or has your league any objection, against organized labor?—A. Not the slightest. In fact, we can not with very good grace, because we are an organization of labor ourselves.

Q. Do you find it more convenient to treat with committees rather than great masses of men?—A. Yes; and where there is a contest and they will agree to abide by the decision that is arrived at, that is the quickest way of getting at a solution. We believe that the organization of labor is a good thing, and we believe the organization of employers is a good thing.

Q. Are the unions in New York able to settle a difficulty with you, or do they have to refer the matter to the building trades council?—A. That is changed within the last 6 months. They have changed their method of doing business. The board of walking delegates has been broken up, and I believe now it is called the building trades council, a branch of the central federated union, which meets every Sunday afternoon. I believe that is the method they follow to-day.

Q. Then in case of a difficulty between a master builder, or your league, and one of the trades or unions would that union be able to end the matter if it could come to terms with you, or must the whole subject be referred to their central body?—A. Oh, they could end it themselves if they desired.

Q. (By Mr. PHILLIPS.) The remedial legislation that you propose—you will give us a copy of it?—A. We shall.

Q. You do not wish to describe it here now?—A. I would rather not here; I would rather go over it carefully, and within the next fortnight I will send it to you.

(On the same date, after the close of the testimony of Mr. Judson Lawson, Mr. Leo was recalled and testified as follows:)

There is a question as to what particular laws are passed through the exertions of the labor lobby, and which are of detriment in a general way to individuals or the city. I want to call your attention to one particular law, the prevailing rate of wages law, that was passed 2 years ago. To-day in New York State I think suits have been entered for over \$3,000,000, and judgments have been confessed by the corporation counsel of the city for very large amounts, based on that law; and remember, gentlemen, that the provisions of that law covered men who worked for wages at so much per month, gave him the opportunity to go back for the full term of his employment, and claim extra for the time he had given, in

addition to the hours provided by this law. That, I think, is the worst sample of law passed largely there by the labor lobby. In speaking of that I speak with full knowledge of the fact that the central federation retained in Albany, at the expense either of the various organizations or at their own expense, all winter long a full lobby, anywhere from 8 to 10 men.

Now, as to the question of the influence that they have upon the legislator: I have a clipping here from the Daily News, and I quote that, gentlemen, because the Daily News is recognized, and they report fully all the proceedings not alone of the federation, but also of the building trades council; and when the old board of walking delegates would meet they would report the meeting in full, and that is the only paper that did it, and we naturally look to it for reports. They reported under date of September 15, 1899, as follows [reading]:

"AFTER WILLIAMS.—STATE FEDERATION SHOWS ITS ANGER.—LISTS FOR THE VOTERS.—OFFICE SEEKERS WILL BE CLASSED AS 'FAIR AND UNFAIR.'

"ALBANY, September 15.

"The Republican party and its officeholders have fared badly at the hands of the Workingmen's State Federation. At the meeting last night attacks were made from all sides on Factory Inspector John Williams and his department. Serious charges were made by the delegates. Half a dozen representatives asserted that the factory inspector had neglected his duties; and as many of the leading trades showed that they had distinct grievances, a committee of 3 was appointed to investigate and report by memorial to the legislature. The committee consists of O'Connell, of New York, Murphy, of Buffalo, and Donnelly, of Albany.

"The discussion of the factory inspector's department was brought about by Delegate Clune, of the polishers' union, who reported a number of alleged violations of the law in his trade, and asked for a committee of metal workers to call on Mr. Williams to ascertain why complaints received no attention from him. Delegate Murphy thought there was something radically wrong in the factory inspector's department, and quoted recent decisions against labor organizations. 'We ought to have a factory inspector who represents workingmen, and not one who is controlled by corporations,' he said.

"Delegate Donnelly said that Albany unions had reported grievances to the factory inspector, but never got any satisfaction. 'Buffalo and Pennsylvania firms are openly violating the weekly-payment law in this city,' he said, 'and nothing is done about it.'

"Delegate O'Brien, of New York, told the convention that the real root of the trouble was politics. 'Politicians control the inspector and his appointees,' he said, 'and of course the corporations who control the politicians have all the protection they want.'

"It was the general opinion that Governor Roosevelt was not giving organized labor the attention that he should, and Delegate Parsons, of New York, referred to the governor as devoting his time 'to jollyng the farmers, while he left the factory inspector to jolly the workingmen.'

"The report of Chairman Hooley, of the legislative committee, which was kept at the capitol last winter, gave a special scoring to Assemblyman Samuel S. Slater, of New York, for opposition to labor interests.

"Referring to the fate of the employers' liability bill, Chairman Hooley said that the prospects of its passage at one time brought to Albany the greatest aggregation of opposing corporation lawyers ever seen at the capitol. This, he said, was the best evidence that the labor bill contemplated large benefits to the people as a whole.

"This bill was again placed in the hands of the legislative committee for early introduction.

"The railroad committee of the assembly was given the distinction of persistent antagonism to all labor bills coming before it.

"The legislative committee and the executive council are preparing two lists of legislators to be headed 'Fair' and 'Unfair.' Last year there were several confusing gradations of friends and foes. These lists will be printed and distributed to the voters throughout the State. They are to be made up from the attitude of senators and assemblymen toward the preferred measures offered by the federation.

"The federation voted unanimously in favor of public ownership and operation of the means of transportation, of telegraph and telephone systems, and of gas, electric, and water supply plants. Delegate Samuel Prince, of New York, moved that all affiliated organizations discuss the advisability of taking inde-

pendent action upon the foregoing demands as a platform, and his motion was carried.

"Secretary Curran reports 233 local unions and 28 central bodies, with a combined membership of 200,000, as now paying per capita tax to the federation. A State organizer is again to be put into the field at once.

"The next legislature will be asked to pass a law conferring on cities the power to employ labor direct on public works instead of by the contract system.

"It was resolved to ask for a law to compel all surface railway companies in the State to provide vestibules for their street cars.

"Superintendent Brockway, of the Elmira reformatory, was given a sharp criticism by the photo-engravers, and the legislature will be appealed to for a law forbidding the use of their art for any purpose in this institution.

"A resolution was adopted commending Assemblyman John J. O'Connell, of the Twenty-sixth district of New York, on his record last winter, and expressing full confidence in him."

This article is as published in the public print. It is a statement which refers to their purpose of issuing a statement of the men who favored their laws, and the men who did not, and the men who opposed the bills they have offered, regardless of the fact that they were willing to make concessions to meet certain conditions they thought more fair—regardless of that, if you opposed the measure, that was sufficient. The Democratic candidate for governor last election said that he met with just exactly that same thing. He was denounced roundly, and afterwards the federation came out and said, No; that he had been denounced unfairly, because he was in sympathy with what they did; that he had offered certain amendments, and under a cast-iron rule which they had adopted he must be classed at that time as opposed to them, because their rule provides that anybody who interfered or suggested any change was to be regarded as in opposition.

Q. (By Mr. FARQUHAR.) This law that you speak of, specifying the rate of wages—was not that a law that covered simply municipal work?—A. Oh, yes; that is all. It covered municipal employees.

Q. What particular intention was there in leaving the clause specifying the rate of wages subject to three or four constructions, as has been stated by some? Was it particularly on account of the ignorance or prejudice of the men who pushed this matter?—A. I blame it on the men who insisted upon its passage and threatened with a club any man who would suggest an amendment. There were some organizations that would not listen to an amendment—it must be passed in toto, or go on record as against it.

Q. Did some municipalities in New York directly put in their charters the wages the employee should have, working 8 hours a day, thus giving special privileges in that locality?—A. Yes; that was true.

Q. And this law aimed to make it uniform?—A. No. The intent may have been that. I do not know what the intent was. I do know what the fact was. The fact was as stated here.

Q. I want to ask about the blacklist. Two-thirds of the men who have voted for these labor laws in the State of New York have never come under the blacklist, have they?—A. Yes.

Q. Have you not members in the senate who have been there 12 or 14 years, and who have voted on these laws, who have never been blacklisted yet?—A. Yes; I think that is so. Men who would not vote to report certain bills that were offered last session and the session before in opposition to the labor lobby did go on the blacklist, and, in fact, the chairman of the board of walking delegates in New York State at that time said that he would have the scalp of the member from his own district as a punishment for having opposed this individual's views.

Q. Does not a good deal of what is called the blacklist in New York in respect to labor legislation cover the city of New York and the river counties more than the rest of the State?—A. I can only answer a question of that sort by saying that the chairman of the committee on labor and labor industry, Mr. Costello, who has been chairman of that committee 4 years, had to make a harder fight than ever for reelection this last term, because the labor organizations made a dead set to beat him in his own district. They used every effort to beat him and said he must not be returned.

(Testimony closed.)

WASHINGTON, D. C., November 15, 1900.

TESTIMONY OF MR. JUDSON LAWSON,*First Vice-President of the Builders' League of New York City.*

The commission met at 10.45 a. m., Vice-Chairman Phillips presiding. At 11.40 a. m. Mr. Judson Lawson, of New York City, first vice-president of the Builders' League of New York City, was introduced as a witness and, being duly sworn, testified as follows:

Q. (By Mr. CLARKE.) Please give your name and post-office address.—A. Judson Lawson, 898 West End avenue, New York City.

Q. What is your occupation?—A. Builder.

Q. Do you hold any office in the Builders' League of New York?—A. First vice-president.

Q. Have you been a member of the New York assembly?—A. In 1894 and 1895 I was a member.

Q. Were you on any committee having the consideration of labor matters?—A. I was chairman of the committee of labor and industry in 1895.

Q. You have heard the testimony of Mr. Leo this morning?—A. Yes.

Q. Do you generally indorse his statements?—A. I do; yes.

Q. Possibly you have something to add?—A. I do not see as I can add anything. Mr. Leo has covered everything fully, so far as our league is concerned. I might add that we are very much in favor of arbitration, not compulsory. I think we can always appoint our own arbitration committees and get along better in that way on the two sides.

Q. What would you say to a law that would require both sides to a labor controversy to propose arbitration and agree to it when offered?—A. How would that arbitration committee be appointed? If you could explain that, I might answer. Would that be a committee appointed by law to sit the year round, to hear evidence on both sides, or would it be a committee appointed by the different parties interested?

Q. I would say trade arbitration.—A. Trade arbitration?

Q. What would you say to a law that would subject either side to a penalty for inaugurating a strike or lockout before offering arbitration?—A. I am heartily in favor of a law of that kind. I think if we had a law like that it would save us a great deal of trouble.

Q. You recognize that the public has a large interest in labor disputes?—A. They are the heavy losers. For instance, in the last coal strike we had I consider the public was the heavy loser, and pays the advance in the price of coal. If we could prevent a thing like that, it would be a great benefit to the country at large.

Q. Are you familiar with the labor laws of New York and with the bills that have been proposed in recent years for amending those laws?—A. Ever since 1893 they have introduced scores of bills every winter. We have been going up there every winter to look after our interests and look after the bills, to see that the bad bills were beaten and the good ones passed, if possible. There is a number of vicious bills introduced every winter, which I do not carry in my mind. They had even an employers' bill there. They had other matters there which did not look much, but meant a great deal, compelling every employer of labor to furnish a suitable receptacle to lock up the mechanic's tools at night, and in the event of not furnishing such a receptacle, if the tools should be stolen, the master mechanic would be subject to a fine of \$25 and liable to imprisonment for not furnishing this receptacle. Now, to show you how ridiculous that was, you take a building in New York where there are from 20 to 25 different employers of labor; taking it from the man in the cellar that builds the stone walls to the bricklayer, and the plumber, and the hoister, there are about 25 master mechanics. That would necessitate the watching and supplying lockers on each floor, and they would need necessarily 25 or 30 boxes and 25 or 30 watchmen on just one job, which is ridiculous.

Q. What is the practice in regard to protecting tools now?—A. The practice has been heretofore that the master mechanic should furnish a room, or a suitable box, which we have generally in the street if the authorities let us put it there; but they came out at one time and would not allow us to put the box in the street, and we had no place for it. Then we generally rigged up a place in the building. But you see this law compels you to have a watchman stand there and watch this box, and if the tools were stolen you were subject to fine and imprisonment. That, of course, did not pass. We would be satisfied to amend the bill so that not every employer of labor, not the employer but the owner of the building, should fur-

nish a suitable locker and a watchman, which we do. I always have a watchman and a locker for the tools. But when they come to us and say that each employer of labor must furnish a locker and watchman, you can see it for yourselves; you will see the charges that we are put to. It goes to show what an expense it would be for the man who was putting up the building. Say you want to build a house at a cost of \$15,000, and on the house you have 10 or 15 master mechanics, and each must furnish a suitable locker and watchman to watch it; look at the expense on the man building the house. Such is the ridiculous kind of bills that we have coming before us that keeps our league continually in Albany. Two or three of us have to be there most of the time.

Q. (By Mr. FARQUHAR.) Do you know what trade initiated this bill?—A. I think it was a labor delegate from the plasterers' unions.

Q. Did the bill come to Albany through that union?—A. Through their delegate.

Q. The plasterers?—A. Yes. He was an assemblyman the last 2 years, and he introduced the bill for their organization.

Q. Did other organizations act in favor of the bill?—A. Yes; they nearly all did—all that could send representatives.

Q. (By Mr. CLARKE.) Was your amendment agreed to?—A. Yes; but the bill was finally killed in committee.

Q. Is there any protection afforded to the workmen, in respect to their tools, now in New York?—A. Yes; I think there is hardly a master mechanic that does not furnish a locker for the tools.

Q. Have they many instances of loss?—A. Yes; but we find the losses generally come through the mechanics themselves. You know we have a pretty tough lot among them. The majority are honest, decent men, but there are many who drink, and some of them, if they want a drink, are apt to slip out a fellow-workman's tools and pawn them overnight to get drink for the next day. That we have known to exist. There is seldom a common thief who will go in and steal tools. They will steal lead pipe, brass fittings, and things of that sort. Generally a mechanic will have his tools stolen at night. I have known of a man going to a building at night and saying to the watchman that he was a mechanic who worked on the building and wanted to take his tools. The watchman would take his word for it, supposing he was one of the workmen, and would let him go in. He would go and get such tools as he wanted and leave. The next day the workman would say that his tools had been stolen, and the watchman would reply that "A man came here last night and got them. I thought he was some person who worked on the building, and he took the tools away." That we can not account for, and you can not make laws to reach that. But under that law which was proposed it would hold the builder responsible.

Q. Would it not be practicable to have a system of checks?—A. I have suggested that. But in a large building, 25 or 30 stories high, with 1,000 to 1,500 men, if they waited to check their tools they would not get out until 8 o'clock, and there would soon be complaints from the union. In the morning, giving out the tools on check, they would not get them out until 10 o'clock. That would not work in the big building, though it might in small buildings where there were only a few men. You see, no matter what you try to do in the way of labor laws you run up against something that is kind of wrong to both sides.

Q. (By Mr. PHILLIPS.) Have you had much experience in the way of conciliation or arbitration in connection with your trade or business?—A. No; I do not think I ever have had any. I have been very fortunate—have had very little trouble. Once, when I was running for the assembly in 1895, there was a labor strike created on my buildings, and they went into the campaign to defeat me on that ground. I could not control it. I had given out the contract to a carpenter, and for some reason the unions got into trouble with the carpenter. They said he had a nonunion man at work and they went in and took out every man on the building. Then they came to me and said, "You must force this contractor to discharge this man and let the rest of the men come back." I said, "I have no right to. He has a contract with me. I can not force him to discharge his men." They said, "We will take the stump against you and defeat you in the campaign." But, unfortunately, they made a mistake, because I got three times as many votes as the year before.

Q. Has your league had experience in the way of conciliation or arbitration?—A. I think we have once or twice. We have sent committees to arbitrate, which have been very successful. I think that is the right way to dispose of labor strikes. In arbitration you can generally get something out of it, unless you have a man on one side or the other that does not want to do what is fair.

Q. (By Mr. FARQUHAR.) What is your opinion of the labor laws in New York now—do you think they are fair both to the employer and employee?—A. Well,

so far as I have met with them they have been fair enough with me, because I have had no trouble with them. Of course, if they get these measures on that they are trying to, it will be very unfair, especially the employers' liability law. It is outrageously unfair. Of course you can not interfere; they have a right to pass such laws as they choose.

Q. (By Mr. CLARKE.) Let me inquire whether there has been any attempt in New York to hold meetings of conference between the employers and the employees with reference to proposed legislation?—A. I do not know of any. If they would have a conference of that kind, I think we could get together and get the right kind of laws.

Q. Do you think it would be a good thing to attempt?—A. Yes, because when we go up and show them how ridiculous the measures are they sometimes say, "Yes; we did not see it in that light," and they are willing to amend it. For instance, they wanted the employer of labor to furnish lockers and watchmen, and when we pointed out to them the objections they said, "That is all right." Take a man putting up a little frame house and having to have 20 watchmen, it is rather expensive.

Q. (By Mr. PHILLIPS.) Would it not be well to inaugurate such a meeting before the legislature meets?—A. Yes, assuming it could be done.

Q. Would it be practicable to do it? Could not your association make a move in that direction?—A. We might make the move, but I think on the other side they would think we were trying to get the better of them. We would be glad to do anything of that kind, because I know we would save a good many measures from being introduced. They bring them up there regardless of what they are.

Q. You would be in better shape to inaugurate such a movement now, since your organization, than you could before?—A. Yes.

Q. (By Mr. CLARKE.) Do you not think such a preliminary conference could be provided for by law under the rules of the general assembly?—A. Yes. I wish you gentlemen would recommend something of the kind whereby we could adopt it. I know our league would willingly take part in anything of the sort. It would save us money and time.

(Testimony closed.)

WASHINGTON, D. C., November 15, 1900.

TESTIMONY OF MR. LEWIS HARDING,

Carpenter and general contractor; New York City.

The commission met at 10.45 a. m., Vice-Chairman Phillips presiding. At 11.52 a. m. Mr. Lewis Harding was introduced as a witness, and, being first duly sworn, testified as follows:

Q. (By Mr. CLARKE.) Please state your name and post-office address.—A. Lewis Harding; 118 East Thirteenth street, New York City.

Q. What is your occupation?—A. I am a carpenter and general contractor.

Q. Are you an officer of the builders' league of New York?—A. I am one of the board of managers.

Q. You have heard the testimony of Mr. Leo and Mr. Lawson?—A. Yes.

Q. Do you indorse their statements?—A. I do, almost entirely. There are some particulars that I would think might be changed just a little. For instance, the chairman asked the percentage of the general builders in the builders' league. The answer was 25 to 30 per cent, but that 25 to 30 per cent probably do 60 per cent of the work of New York City. There are a great number of builders, but the large percentage of the work is done by a few, and the majority of this few are in the builders' league and also in the building trades club.

Q. (By Mr. PHILLIPS.) The intent of the question was to know what per cent of the building was represented—not the number of individuals.—A. I would think at least 75 per cent.

Q. Of the whole city of New York?—A. Yes.

Q. Is the building trades club an organization similar to your league?—A. It is similar; yes. To be eligible to membership in the building trades club you must be an employer of labor in New York City, and they join as individuals. For instance, a firm may have one of its members as a member of the building trades club without the firm being at all represented. In the builders' league, however, the membership goes to the firm, and the firm designates who shall be its representative in the league.

Q. (By Mr. CLARKE.) The purposes of the two organizations are similar?—A. Very similar, although the building trades club does not take the active interest in the building trades that the builders' league does. The builders' league takes up all questions of dispute between employers and employees. If one of the trade organizations has trouble with its men, the league undertakes to negotiate a settlement between them, while the building trades club is more of a social organization made up of business men. It does, however, furnish headquarters for a meeting place for most of the trade organizations, and probably most of the wealthy contractors in New York City are members of the building trades club, while the builders' league is a much more active organization.

Q. Do some men belong to both?—A. A number do. I am a member of both.

Q. Are they rivals in any sense?—A. No; not as a general thing.

Q. Do they ever cooperate?—A. They often do in legislative matters at Albany. The building trades club, together with the masons and builders' association, the master carpenters' association, the master plumbers and the master steam fitters, have what is known as a joint legislative committee that goes to Albany and either favors or opposes any measure that is offered there that has any bearing on the building trade in the city. The builders' league have an independent committee of their own up there. They very often cooperate with each other unless their interests differ. If they do differ, of course they do not cooperate, but that is very rare.

Q. Are these committees or agents maintained at Albany throughout the session?—A. Oh, no; they are there simply to watch the different bills. The organization have copies of the bills sent to them, and if there is anything that is to our detriment or any measure that we think to the benefit of the building trades we send a committee up to Albany before the senate and assembly committees and either oppose or favor it as strikes us to be proper, but we do not have any regular representative in Albany all the time.

Q. Have you ever experienced any difficulty in obtaining suitable legislation or in preventing bad legislation on these subjects?—A. Well, we find this: When we go up to Albany, and when we speak to the representatives from our districts, they will say, "The labor element wants this bill to pass. Now, we have not very much interest in it ourselves and would like to oppose it for you, but if we do we will go on the blacklist. We have already been told that if we oppose that bill we do not get returned to the assembly." That is what we have found in Albany for the last 3 or 4 winters. We find that the labor organizations have a representative there at all times, and we find that both the assemblymen and the senators are afraid of what the effect on their next election will be through the labor organization of the State.

Q. Is it the custom of labor organizations to print and circulate a blacklist of public men?—A. I do not know so much about the circulation of them. There is no question about the fact that they are printed and handed to their members. For instance, 2 or 3 of my men, during the strike we had at the close of the summer of 1899, showed me a list of the employers who, although compelled to sign the demand that they made upon us at that time, were placed on the blacklist because we took a stand against complying with all the provisions of the demand that was made upon us and because we undertook to fight the strike. We were placed on the blacklist. I understood, only a very few weeks ago, that these names are still on the boards of the rooms in which they meet as the firms to be set upon at the first opportunity that they may get.

Q. Have the builders' league or the building trades club any similar weapon—any blacklist or any list as to men in public life who oppose their measures?—A. I think not. I do not know that we have any—certainly not as an organization. Individually we may have people that we blacklist so far as our own vote is concerned, but certainly not as an organization.

Q. Has there ever been any concerted action to defeat a man for reelection or to prevent him from being elected in the first instance?—A. I know of no organization in New York City connected with the building trades that politics enters into at all. I do not know of one building trades organization that takes any stand on either side in politics.

Q. When you say building trades do you mean employees as well as employers?—A. No; I mean employers. Of course, as to the employees I only know from hearsay. I belong to several of the employers' organizations myself and I know that politics is debarred in them all.

Q. You think, then, from your observations in the assembly that there is a great hesitation on the part of public men to make what is called an antilabor record?—A. There is no question but that is the case. They are afraid of the labor vote and they do not hesitate to say so.

Q. Is it, in your judgment, a means of defeating wise legislation and of enacting measures that are unwise and unfair?—A. Yes.

Q. (By Mr. FARQUHAR.) About what proportion of the members in either party of your legislature are blacklisted every year by the labor men?—A. It does not make any difference whether they are Republicans or Democrats, the whip is held over them just the same.

Q. Yes; but when the list is printed annually by the workmen's associations about what proportion of them are regarded as antilabor men?—A. I could not answer you intelligently. What I drew my inference from in making the remark which I did is from personal conversation with men at Albany when I have gone there at different times. I have been at Albany occasionally with Mr. Lawson and Mr. Leo, and we have been told this: "We can not favor this measure because the labor people do not want it, or we can not oppose it because the labor element want it."

Q. That would be a natural proposition anyway with a representative in Albany at any time on any bill, whether insurance, building, or anything else, would it not? Would not that be a natural reason to be given by any legislator?—A. I do not know why it should be, "Because the labor organizations want it"—why that should be the natural answer. Why not, "Because the employers want it?" I think the proper answer would be, "Because my constituents want it."

Q. Do you not think that a good deal of what you call the whip is a matter that is very often confined to local bills, and not to those which apply generally over the whole State?—A. The employers' liability bill was a matter which took in the whole State. The majority of the bills at Albany, so far as labor and capital are concerned, are bills that affect the whole State—all cities of the first class, anyway.

Q. Are you aware that the liability bill there will be over every State in the Union within 5 years?—A. I presume there will be some bill.

Q. You are aware there is a tremendous public pressure in the way of settling this some way?—A. Yes; 2 years ago, as a matter of compromise, after a strong discussion before the labor and industry committee, we agreed that we would make no opposition to having the same law in New York that they have in Massachusetts.

Q. Do you think the State of New York has as good a body of labor laws as can be found in this country?—A. I am not probably as familiar with the labor laws all over the whole country, but I certainly do not think the labor laws of the State of New York are as good as they could be. I think there could be better laws for both the men and the employers.

Q. Has not the improvement of labor laws in New York come through organization?—A. I do not think we have got an improvement in them. I think pretty near every labor law enacted in the last several years has worked a detriment to the men rather than an improvement.

Q. You would not care to specify, would you, where harm has been worked by any of the laws now in existence?—A. Yes, I will, in one particular instance that has been cited to-day—the Tobin law—that no piece of granite for municipal or State business can be finished outside of New York State. Now, there are certain pillars and columns that enter into some of our large buildings where granite can not be used because there is no machinery in the State of New York to handle them. There are very few of them used anyway, and there are very few places in the country where the granite is found that there is a plant sufficiently large enough to handle them. For that reason some other stone has to take its place. And then I heard it stated that in one addition to the museum in Central Park, New York, in one wing of that museum the extra cost of the granite, by it not being permitted to be cut outside the State of New York, was over \$100,000.

Q. (By Mr. PHILLIPS.) Have you in mind any other objectionable features about that law, aside from the finishing of the material inside the State?—A. That is all there is to it. The Tobin law is simply that all granite for municipal work must be cut and finished inside the State of New York. If there was any granite that could be put into a building to be found in the State of New York they would demand that the granite come from the State also.

Q. (By Mr. FARQUHAR.) At the time the law was passed did they ask for it for the reason that it would bring that much more labor into the State of New York?—A. I presume their object in asking it was that they might be able to entirely control the price of labor. That seems to be the unfortunate erroneous idea that the labor man has. If he thinks he can get control of the price of his day's labor he does not consider that he may drive certain trade away from New York State and consequently cut his salary down by being idle two-thirds of his time. That feature of the question he seems to lose sight of entirely. Ten years ago, and

even less than ten years ago, the great majority of the doors, sash, and blinds, and trim of all kinds that went in a building in the carpenter line was manufactured within the limits of what is known to-day as Greater New York. To-day, I venture to say, not 20 per cent of it is manufactured there, and the other 80 per cent is shipped, some as far as from Detroit, and even west of that.

Q. (By Mr. LITCHMAN.) Do you mean to say that is due to labor organizations?—A. I would say that labor organizations are the greatest factor in changing and bringing about that condition. I mean that the high price of labor in New York does not allow people to manufacture and compete with out of town concerns.

Q. Is it not due to some extent to the changed conditions under which these things are produced?—A. Somewhat; but the changed conditions are largely brought about by the increase in wages and the shortness of the hours which the mechanic works.

Q. Is it not largely due to the changed condition of employment and the specialty of manufacture?—A. The high price of labor has brought about that change of condition—has been the greatest factor in bringing about that changed condition.

Q. Is it not a fact that in almost every department of the building trade a specialty of manufacture has grown up?—A. Yes.

Q. The manufacture of sash and blinds, for instance, is a specialty of itself now?—A. No.

Q. It is not?—A. No. There are very few factories, I think, in the country that manufacture sash and blinds only. Any factory that manufactures them will also manufacture window trim and doors.

Q. The point I want to bring out is this, that there have grown up special lines of manufacturing industry in the building trade, as in the shoe trade, and as in most of the mechanical trades?—A. A special line. For instance, I can remember mills that made a specialty of manufacturing woodwork for building, and they do the same thing to-day.

Q. There was a time, of course, when the carpenter made the whole building.—A. That was before machinery came in.

Q. I want to find out how far this changed condition is due to the introduction of machinery. I understand you to say that it is due to labor organizations, and the exactions of labor organizations, that this change has been brought about; but I want to see if it is not due also to the changed conditions of production?—A. That is not what I said. I said that the mills in the vicinity of New York manufactured the greater percentage of the woodwork material that went into a building, where to-day they do not manufacture 20 per cent of it. The other 80 per cent is done outside of the State in the same kind of mill and with the same kind of machinery.

Q. How far is that due to the moving of the factory to the source of supply of the raw material?—A. Some of it may be due to that, but in very few instances do I know of a factory being moved. Two instances I know of, large trim factories, which moved from New York City, in both cases as the outcome of a strike. The factories did not feel that they could compete with the price of materials coming in from out of town—the New York Woodworking Company, which is now the Batavia Woodworking Company. It was moved as the result of the strike.

Q. (By Mr. PHILLIPS.) Where to?—A. To Batavia. Their factory was in New York City.

Q. In the same State?—A. Yes; but where labor is very much less than it is in New York.

Q. (By Mr. FARQUHAR.) Taxes are less, too, you had better say.—A. Taxes are less, too.

Q. (By Mr. LITCHMAN.) The cost of manufacture, too, is less?—A. Labor is the biggest item in the cost of manufacture in our line.

Q. (By Mr. FARQUHAR.) I would like to ask one question in respect to this granite cutting and this Tobin bill: Do you know what the position of the New England quarry owners was on that bill?—A. I do not know.

Q. Do you know or have you known, as a builder, that it is a close corporation, the whole of the granite quarries of New England?—A. No; I do not.

Q. I simply asked to know whether, as a practical builder, you had known that it had been the intention of the whole of the New England quarries both to quarry and to prepare all the granite, just as a ready-made clothing house would?—A. I know that. I do not know that there is any such agreement. I know that the majority of the granite coming into New York State for private work is prepared when it comes in.

Q. And the demand under the Tobin bill was simply that New York workmen should do that cutting?—A. On all municipal work.

Q. (By Mr. LITCHMAN.) Your idea is that was a turning aside of the ordinary course of business?—A. Yes.

Q. (By Mr. CLARKE.) You think it was uneconomical?—A. No question about that to my mind.

Q. You favor arbitration as a means of settling and avoiding labor difficulties?—A. I certainly do.

Q. Would you think favorably of a law that would subject to a penalty anybody who should inaugurate a strike or lockout without first attempting arbitration?—A. If the same law would affect the people locked out provided they stuck without asking for arbitration. I would not favor a law that would impose a penalty upon the employer, leaving the workmen with no penalty against them if they should strike.

Q. Assuming the law would be fair to both sides, you would favor the principle?—A. I certainly would. Most employers of New York City have come to that point to-day where they court arbitration in settling difficulties.

Q. (By Mr. PHILLIPS.) Frequently strikes and lockouts are inaugurated without due notice to the other party?—A. Without any notice.

Q. You would not only be in favor of notice, but would compel them to arbitrate—one or the other party?—A. Compel both parties to arbitrate; I would be in favor of that.

Q. If they did not make an effort to arbitrate they would be subject to a penalty?—A. Yes; I would favor that very much.

Q. Do you wish to supplement your statement or the statements of the gentlemen who preceded you?—A. Generally, throughout the trade, I know of nothing that I could add. I know more about the carpenters' organization than I do of the rest. I could tell you the condition of affairs that exists between them at the present time.

Mr. PHILLIPS. The commission would be glad to hear you on that question.

The WITNESS. Between the 1st and the 16th of September, in 1890, the Master Carpenters' Association, and pretty nearly every member of it, and for that matter every employing carpenter in the city of New York, received the following demand from the Journeymen Carpenters' Association: (Reading) "An agreement between the employing carpenters and builders and the Joint Carpenters' Organization of New York City. Sir: We the undersigned, representing the carpenters' organizations of New York City, hereby respectfully request your signature to this document, thereby attesting your agreement to our demands of a Saturday half holiday and 50 cents per hour. No work to be done between the hours of 12 m. and 5 p. m., on Saturdays. The half holiday to go into effect on Saturday, September 16. The wages to be \$4 per day on and after September 18, thereby making the schedule henceforward 44 hours, at 50 cents an hour, \$22 per week. Wages to be paid weekly at or before 12 o'clock on the job."

Some of us received this demand for our signatures less than 5 days previous to the time it was to go into effect. Many of us had work that we had contracted for 4 months, and some probably a year, before that time, at the old price which we were paying up until that time. Where for 48 hours, constituting a week's work, we paid \$21, or \$3.50 a day, they now demanded \$22 a week for 44 hours' work. This we thought was an unreasonable advance. Another unfair part of the agreement—we were perfectly willing, and in fact some of the employers had advocated, that the men should have a half holiday on Saturday, but we did feel that we should be permitted to work our men on Saturday between the hours of 12 and 5 if we had anything special we wanted to do, provided we paid them double time. They gave us that right on Sunday. They gave the right between the hours of 5 in the evening and 8 o'clock next morning. They gave us that right—to employ at double time if we were disposed to do so, but they told us in that agreement that between the hours of 12 and 5 no work should be done at any price. Now, these hours to some of the jobbing carpenters in the lower part of the city—the office building section—are invaluable, because after the men leave their places of business on Saturday afternoon, if there is any jobbing or alteration in the office they want made, they want the work done before they come back again on Monday morning. That part of the agreement we thought we could not stand, and we thought that they were asking a little too much increase when they asked more per week for 4 hours less than we had been paying them for 4 hours more.

We met a committee from their organization, who told our committee they had power to settle the matter, and they talked and hashed the question over for 2 or 3 days, and finally they came to an agreement whereby they agreed to work for 47 cents an hour and that this agreement should only last until the 1st of February; that is, the demand that there should be no work on Saturday between the hours

of 12 and 5. Our committee agreed to it and both sides signed the agreement, which is as follows: (Reading.)

"The counter proposition from the unions' committee which is offered as a compromise is as follows:

"Wages to be 47 cents per hour, 8 hours per day, as at present, on Saturday the men quit work at 12 o'clock m., and the committee indorse the third, fourth, fifth, and sixth lines of the employers' proposition, viz:

"Third. A committee of arbitration be appointed from both parties

"Fourth, to adjust the matter of wages, hours, and the difference

"Fifth, between city and out of town material, and any questions

"Sixth, which may arise for the following year beginning February 1, 1900.

"This proposition was unanimously agreed to after a full discussion and signed by:

"L. W. Davidson, Geo. Cavanagh, C. A. Judge, Geo. D. Gaillan, for the Joint Organizations of Carpenters. John L. Hamilton, Robert Christie, William A. Hoe, Hugh Getty, D. Mitchell, John H. Carl, for the Master Carpenters' Organization."

We asked the question if our men could return to work the next morning. They said, "Yes; we are going to have a general meeting to-night and we will issue an order to our men in the morning to go back to work." The next day we got word that this committee that came to us representing that they had power to settle the differences between the employers and the employees had no power at all; that they simply signed the agreement on their own responsibility, and that the original demand would be lived up to. Well, after a couple of weeks more of fighting, on October 4 the members of the master carpenters' organization that had not already given in signed in a body, all at once, the demands—swallowed the bait.

You see, this demand does not specify any time when the demand shall expire. It may be broken in a week, or in two weeks, or a month, or it may last for years. We agreed to live up to the demands that they set out there; but we did, however, ask them to appoint a committee of arbitration to meet a committee from us, to see if we could not arrive at some amicable understanding whereby we could have a yearly agreement with them.

They appointed a committee, and from February 15 up to August 15 we endeavored, through our arbitration committee, to arrive at some agreement. But we always met with this objection: that the unions demanded that this original demand be lived up to. Further, that they would not keep any appointment they made with us. For instance, if a date was set for a conference between our committee and theirs, the time for the conference would arrive and their committee would not put in an appearance at all. And when we wrote to the association to know why our committee had not been met, we would get notice of the meeting of another committee—a new one entirely—not the same arbitration committee that they had originally, but an entirely new committee would come with a proposition, and we would make a counter one, and they would agree for a final conference on a certain day, and when that time arrived their people would never show up again. So that on August 15 the master carpenters' association received a report from its arbitration committee, of which the following is a copy:

"New York, August 14, 1900.

"The arbitration committee of master carpenters' association would respectfully report that they have been in conference with committee of brotherhood of carpenters since February 13, and have met in committee on February 13, June 4, 11, and 15, July 9, and August 13. On February 13, matter of wages and a half a day Saturday afternoon were fully discussed. It was suggested that a committee of the brotherhood should be appointed with full power to act. In the matter of wages, it was asked that we put in writing our proposition, and on February 14 the following letter was sent:

"Mr. T. C. WALSH, *Secretary*.

"DEAR SIR: At a conference meeting, held last night, of the master carpenters' association conference committee and the committee of joint carpenters' associations, the following proposition was made for the consideration of the unions: That the wages of carpenters working in shops be \$3 per day and the wages for outside work be \$3.75 per day; and that, in the interest of harmony between employers and employees, we suggest the appointment of a committee of conference by the unions, which shall have power to act with the master carpenters' conference committee for the consideration and settlement of any questions and difficulties that may arise, and the making of a yearly agreement in regard to wages, and the elimination of sympathetic strikes.

"ROBERT CHRISTIE, *Secretary*."

112 INDUSTRIAL COMMISSION:—MANUFACTURES AND BUSINESS.

"No answer was received from them, and on May 18 the following letter was sent:

"MAY 18, 1900.

"MR. B. F. FEATHERSON,
"Secretary of the District Council,
"240 East Eightieth Street, City.

"DEAR SIR: I herewith send you copy of proposition made to your body, and sent to T. C. Walsh, secretary, on February 14, 1900. We never received any answer up to May 4, 1900, and on that day we sent him again a letter, a copy of which I herewith send you. I think it will be unnecessary to express the desire of the master carpenters' association further than what is said in these two letters.

"Yours, respectfully,

ROBERT CHRISTIE, *Chairman.*

"After additional correspondence a meeting was called in conference on June 4. "A meeting of the arbitration committee was called at 8 o'clock p. m., at office of master carpenters' association, Townsend Building, corner Broadway and Twenty-fifth street, to meet committee of New York District Council of Brotherhood of Carpenters, to consult on the matter of wages, work on Saturday afternoon, etc.

"Present: Messrs. Getty, Hamilton, Mitchell, Christie, and Hoe, of arbitration committee; from council of brotherhood, Messrs. Spretar, Blatchford, Ehret, Mortensen, Bohman, and Haar.

"A general discussion was had in the matter of wages, etc., and the following was submitted by the brotherhood:

"The following are the propositions submitted by locals 476, 497, 375:

"First. That men will work for and receive in carpenters' shops 42 cents an hour as the minimum rate of wages; men on buildings and outside work to receive 50 cents an hour; and 44 hours to constitute a week's work.

"Second. Outside men not to handle or put up interior finish that has not the union label on it.

"Third. The boss builders to agree to manufacture their own or buy their interior finish from union shops and have the union label on it.

"Fourth. Cabinetmakers and the men working in so-called cabinet shops to demand a 44 hours' week and wages at a minimum rate of 42 cents an hour at the end of the year.

"Fifth. That in jobbing shops where men working inside and outside shall get outside wages.

"Sixth. This agreement to be signed by the members of the district council and a committee from the boss builders' association, and to stand good for 1 year.

"Which was received without debate.

"An adjournment was taken to June 11, at 8 p. m.

"WILLIAM A. HOE, *Secretary.*

"An adjournment was taken to June 9, when the committee met in conference and the following was offered by the committee of master carpenters:

"The wages of men working outside of shops shall be 47 cents per hour; the wages of men when working in shops shall be 39 cents per hour, minimum wages.

"An adjournment was taken to July 30, at 8 o'clock p. m. On July 27 the following was received:

"MR. W. A. HOE, *Secretary.*

"DEAR SIR: At a meeting of the district council held last evening I was instructed to notify you that it would be impossible for our committee to meet you on Monday next, but by August 13, or any date after which would be convenient to the master carpenters' association, our committee will be ready to meet your committee and come to a final understanding.

"Respectfully, yours,

"GEORGE SLATER,
"Secretary of District Council."

"And in answer the following was sent:

"MR. GEORGE SLATER,

"Secretary District Council, Brotherhood of Carpenters,
"49 South Tenth Street, Brooklyn.

"DEAR SIR: As per your request, I have called a meeting of the arbitration committee of master carpenters to meet with your committee for Monday,

August 13, at 8.30 p. m., at office of master carpenters' association, Townsend Building, Broadway and Twenty-fifth street.

"Respectfully, yours,

"WILLIAM A. HOE,
"Secretary Arbitration Committee."

"On August 13 the committee met again, and the answer from the brotherhood was that the rate of wages for outside men from \$4 per day could not be reduced, but the proposition of 39 cents per hour might be considered. This your committee would not accept, as the rate of wages now paid in mills and cabinet shops is 85 cents per hour. Your committee would recommend that no other conference shall be had with the brotherhood until such committee from the brotherhood shall have full power to act. Our time has been spent without results, as they do not feel disposed to yield any point. As at present there are 4 carpenters' associations—brotherhood of carpenters (say 4,300), lodges seceded from the brotherhood (say 1,100), the amalgamated carpenters, and the city carpenters (number we did not get)—and that all rates are being paid to carpenters from \$3 a day up. The unions are in a very demoralized state, but seem not at all willing to make any concession or to do anything for the good of the trade.

"HUGH GETTY, Chairman.

"WILLIAM A. HOE, Secretary."

After receiving this report from its arbitration committee, the master carpenters decided on August 15, 1900, that they would not hold themselves bound to live up to the agreement they had signed a year ago; that they would make the best terms with the men individually that they could. That is what they are doing at the present time.

The resolution passed by the master carpenters at this time was:

"Resolved, That it is deemed inexpedient to hold further conferences with such committees from the brotherhood until such committees have full power to act on matters under consideration.

"And, further, that notice be, and hereby is, given to the United Brotherhood of Carpenters and Joiners of America, of this city, that the circular signed by members of this organization bearing date October 4, 1899, relative to the rate of wages, etc., be, and hereby is, declared terminated and of no effect on and after August 20, 1900."

So that at the present time we can hire carpenters for whatever we can, without violating any agreement. We have terminated all agreements that we have with our men, although, as a member of the organization, I know the feeling and spirit of the organization to be that they would be willing to have an agreement—like to have some basis. Not so much to have a better feeling themselves personally with their men, but so they would be able to be on a fairer basis to compete with some of the competitors—some of the men in the same line who are outside the limit of our organization. That is the reason why we are more anxious to have an agreement with our men.

Q. (By Mr. LITCHMAN.) The fair-minded employer of labor, then, desires to deal justly with his help?—A. There is no question about that.

Q. He feels the effect of unfair competition on the part of the unscrupulous employer as much as the employee himself?—A. True. Our organization represents a membership nowhere near a majority of the employing carpenters in number, but it represents a membership that does the large percentage of the work in New York City. Now, if we had an agreement with our men that both sides would live up to, that would be just and equitable to both sides. These outside people would not have the same power they have to-day to compete with us in an unfair way.

Q. Then the organization of labor, intelligently conducted, would assist you in bringing about that condition of affairs?—A. That is right.

Q. (By Mr. CLARKE.) In view of the conditions of building in these recent years, is it not almost necessary, to enable you to estimate a job safely, that you should know a long time in advance about what your labor is going to cost?—A. That is the unfortunate part of it. We do not know. Very often that thing loses us a job. Buildings will go up in New York, and some take 18 months to complete. Our work goes on at the end, at the wind-up of the building, within the last 2 months of its completion, but we have to estimate that building probably 18 months before that, when the general contract is given out. Now, we can only use our judgment as to what wages we will have to pay when we come to put that work in the building. It may be less and it may be more. At the present time we have no agreement, every man hiring his men as cheap as he can. If we had an agreement that we would pay them so much per hour we would have to live up to it, because there would be a penalty attached if we did not.

Q. (By Mr. LITCHMAN.) Have you thought along the line of a mutual organization, where the employers and employees could come together either directly or by delegated authority?—A. I think that a delegated authority would be so unfamiliar with the subject that it could not be either an advantage to the men or to the employer, but I have thought that that would be a real good thing if there could be some law that would make the different organizations have an agreement—say a certain time in the year agree on the scale of wages and on the number of hours of work, and so on—that they could live up to, and if either party broke that it should be subject to a penalty, or if there was a controversy it should be left to arbitration. But I do not think that to go before a national or State board of arbitration would do any good. It would be like going before a judge to-day in court.

Q. My question was to see whether or no you had thought along the line of a mutual organization of employers and employed.—A. No; I do not think we could have a mutual organization.

Q. Why not? Are the interests too antagonistic?—A. I think so. I do not think it would be possible.

Q. Such an organization has existed in the past in a limited way.—A. In a very limited way. I understand the Joint Society of Mechanics and Tradesmen in New York, one of the oldest institutions, was of that nature, but that was in the remote past.

Q. (By Mr. FARQUHAR.) As you have no agreement at present, either with the brotherhood or the amalgamated association, and it is an open competition on the part of the workmen and employers, what are the benefits to your trade or to the workmen of this open competition that is on at the present time, or is it injurious?—A. I do not think to anybody who takes any large contracts for work that the benefit is very much. It is of considerable benefit to the smaller employer. It permits him, now that business is slack in the carpenter line and a very small percentage of them employed, to hire a man very much cheaper than he could honestly if he had an agreement to pay his men the regular standing rate of wages. That standard rate would be above what the majority of carpenters in New York City are getting to-day.

Q. In this open competition, does the man who puts up a building or has the building put up for him gain anything?—A. No; I do not think he does, because a man can not safely estimate. But the man who has jobbing done sometimes gets the benefit of it. In a building the contractor would hardly take the risk.

(Testimony closed.)

WASHINGTON, D. C., November 15, 1900.

TESTIMONY OF MR. DAVID BLAUSTEIN,

Superintendent Educational Alliance of New York.

The commission met at 2.10 p. m., Mr. A. L. Harris presiding. At that time Mr. David Blaustein was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. CLARKE.) Please state your name and post-office address.—A. David Blaustein, No. 197 East Broadway, New York City.

Q. Have you prepared a statement, Mr. Blaustein?—A. No; I have not. I am ready to answer general questions on the topics suggested by yourselves.

Q. How long has this organization, with which you are officially connected, been in existence?—A. It has been in existence since 1891, and I have been connected with it since July, 1898.

Q. How large is it, numerically?—A. It is very large, indeed. It reaches an average of 6,000 people per day.

Q. How is the work supported?—A. It is supported by voluntary contributions, mostly by the Jewish people of the city of New York.

Q. Is this a subject of contribution in the synagogues?—A. No; it is not sectarian with the Jews. It is not even sectarian in the broadest sense of the word. While mainly supported by the Jewish people of the city of New York, and the beneficiaries are mostly Jews, still we make no distinctions; if a non-Jew applies for admission into a class or club, or wishes to draw books from our library, or wishes to attend our gymnasium, we ask no questions. In fact, we have people of all denominations; we have colored people in our classes.

Q. But your work is mostly among Hebrews?—A. Yes.

Q. Is it somewhat of a similar character to that of the college settlement in New York?—A. It is, and it is not, in so far that we really do not carry on their scientific studies; we do not experiment upon the people who come. We might do it indirectly, but it is mostly to benefit the individuals who come there that we have classes and clubs. Our work is divided into three parts, and it is according to the times. For instance, we have morning classes; these are intended for children of school age who do not attend the public school, and it is mostly for such children who have recently arrived. We sometimes have children on the second day after their arrival from Europe. We prepare them there for the public schools. As soon as they learn to speak the language and as soon as we hear that there is room in the public schools we promote them there. But our work with the children is not only to give them instruction as such, but we endeavor to exert also a moral influence over them. For instance, we look after their cleanliness; we have our barbers, whose bills are quite large every month. We send the child first to the barber. We have a bath in our institution and we see that the children get a bath as often as possible. Every Friday, in our large auditorium, we have patriotic exercises, and through the children we also reach their parents, who also are recent arrivals. We have occasional meetings for these parents, where we tell them of American life. These meetings are more of a social nature. We have also in the morning classes of children or young people who are graduates of public schools, who do not feel inclined to work in factories, but want to prepare themselves for office work, and we have commercial classes. We also have in our building a kindergarten class for children under kindergarten age who would not be admitted to the public kindergartens, and the special feature of our kindergarten classes is that we have mostly such children whose parents work, both father and mother. We also give a lunch to the children. It is a little above a nursery. We would, for instance, not take children under the age of 3, but we take children under the age of 5. We have our reading room, which is open from 9 in the morning until 10 at night. Then there is a library in the city, supported mostly by the Jewish people, called the Aguilar Free Library, and they have a branch in our building. The books and the magazines that the library has are so selected as to meet the requirements of the immigrants. For instance, we have quite a number of Hebrew books, Russian books, Yiddish books—that is, the dialect spoken by the people of the neighborhood—the American history; we have the Constitution of the United States translated in all these languages. We have books for general readers. Most of the books are for these immigrants. This is, in a general way, our morning work.

In the afternoon we have classes for children who attend the public schools, but come to us after school hours, and these begin at about 4 o'clock and last until 7, and they come for various purposes, but the largest number of children come for religious instruction. This is the only part in our institution that is sectarian. We impart to the children a religious instruction, and we accomplish a twofold end by it—the children come under the influence of religion and at the same time we also fill the gap between the rising and the passing generation. On the east side there is a great problem, and that is to make the children respect their parents. The children all speak English, the parents do not, and the children lose all respect for them. The parents have their religious views, and they have their services in accordance with their views, which do not appeal to the children. As a natural result there is a great conflict between the children and the parents. We impart religious instruction to the children with that end in view. We dwell mostly on the ethical part of religion. We do not lay stress on the ceremonial part, but at the same time we teach them to respect their traditions and to respect their parents. We make it our business to tell the children that while their parents may not know English, while they may not be familiar with American conditions, their parents have had a training at home which might correspond even to college education here. Of course it was an one-sided education, mostly Jewish Talmudic, but still their minds have been exercised and developed; also that morally they stand high. We have industrial classes for girls—sewing, millinery, dressmaking, and cooking. We have gymnasium one afternoon for the boys and the other afternoon for girls. We give to the children physical culture with some end in view—to give them what their parents did not have at home. We therefore lay great stress upon it. The Jew has, for various reasons, neglected physical culture for the past, say, thousand years, and we therefore lay great stress upon it to the children. We make it a point that the children should join our classes of physical culture.

Q. Do they take kindly to it?—A. They do. Then we have in the afternoon also literary clubs for boys and literary clubs for girls. We have a club under the auspices of the City History Association. We want to teach the children

first the history of the city of New York. We have dramatic club meetings in the afternoon; in other words, social and literary clubs. We have in our building a very large Penny Provident Bank, to teach children to be thrifty. November 1 we had as many as 18,000 depositors, little children whose deposits vary from 1 cent to 50.

Q. Is that business carried on by the society or separate?—A. We act as the agent for the Penny Provident Fund, but ours is said to be not the largest station in New York City, but one of the largest stations in New York City. This, in a general way, is our afternoon work for children. Just one more thing, very important: We have in the library reference rooms and study rooms for the children. They could not do it at home, would not have there accommodations, would have no one to help them; but in our room they are in the habit of learning their school lessons.

Q. (By Mr. PHILLIPS.) You have a number of different languages. How do you manage that in the library and also in your instruction?—A. That I will tell when I come to the evening work. I am speaking now of the children, and with the children we do the work mostly in the English language. Most of the pupils in our schools are Russians, Roumanians, Galicians, and we have teachers who speak all these languages. So when children are first introduced into American life they are taught to give the first words in their own languages, and then taught in English.

Now comes the most important part of our work, the evening work. In the evening we have the same work carried on as during the day; we have it for adults who work either in factories or in stores or in the sweat shops. And for some of them who can not come to us before 9 o'clock we have evening classes arranged to open up as late as that, and our building is open as late as 11.

Q. (By Mr. CLARKE.) Do many call as late as 9?—A. A very large number. At any given time if you will come to our building you will find not less than 1,000 people there.

Q. I believe you have not told where it is located.—A. Our building is located right in the center of the Jewish quarter, East Broadway and Jefferson street. Now, in the evening we have first classes for beginners to study English; in other words, to teach them the three R's. There a very peculiar population comes to us—some who have not had any education at home at all; others who have had an education at home and want to learn the same thing in English; others, again, who are self-made people, who have studied and never systematized their knowledge, and had not the opportunity probably at home, and come to us that we should help them in systematizing their own knowledge. We do not duplicate the public-school work. For instance, in the winter, when the public night schools are open, we do not encourage people to come to us to study the rudiments of the English language, or arithmetic, or American history; but they prefer to come to us, for the reason that we take an individual interest in them, and, besides, that our teachers are mostly themselves foreigners, but American by education. They prefer, therefore, to come to us; but still during the winter months we do not have so many classes for beginners. And we have also in the evening commercial courses: young people working in offices, in order to improve themselves, come to us to study bookkeeping, stenography, and typewriting. We have also people who come to prepare themselves for college. They work during the day in factories, and, as I said before, they are people who had some education at home and have higher ambitions, so we have classes in advanced studies. We also have general culture classes that do not lead to some particular end. But the people of the east side are very eager to know everything, and we have, therefore, classes in literature, history, economics, constitutional history, and also classes in music. There are quite a number of talented people on the east side, and we give them an opportunity to develop their talent. We have also classes in art. This we do intentionally, in order to develop that taste in the Jewish people which has been neglected by them so many centuries.

This is, in a general way, our work during the week. Saturday the building is closed for secular work. Although the Alliance is a nonsectarian institution, still we are in the Jewish midst, and the people would feel hurt were we to have classes on the Sabbath day. This day is therefore devoted to religious work. In our large hall we have services for older people. They are conducted in a conservative way: for instance, all prayers are read in Hebrew, but we have a minister who addresses the congregation in plain German, which is nearer to Yiddish, on topics of the day, which they otherwise would not have the chance probably to hear. Then they are taught decorum and order, which, unfortunately, in many of our synagogues is not to be found. In other words, the People's Synagogue—that is what it is called—while it is a synagogue in the full sense of the word nevertheless has educational value for the people.

In the afternoon we have services for the children, and the services are conducted mostly in English, and the rabbis of various congregations speak to the children, and the service is more cheerful and more progressive.

In the evening—Saturday evening—the building is thrown open for social work, and there in every room you will find people come together for recreation. No serious study is carried on Saturday night, and there we have a number of boys' clubs, a number of girls' clubs, and clubs of older people. They have debates and informal receptions. We have a military company drilling. We have our own band, giving a little concert in one of the halls. Then in the large hall there will be an entertainment. The entertainment always has in view a counteracting of the evil of the theaters of the east side. Our theaters are accessible to the people, and have by no means a moralizing influence; there are in New York City three standing Jewish theaters, and they cater, in many instances, to the lower wishes of the people and have a demoralizing effect. Our entertainments are intended to raise the tone of theatrical performances. I myself had the satisfaction of finding out from those who have been to our entertainments that they are free to say they do not care after that to go to any of the theaters in the neighborhood.

The same is the case with our Sunday work. On Sunday we do not have classes; it is mostly social work. We also publish in our institution a monthly magazine. It is conducted by the young people belonging to our clubs. It chiefly deals with affairs in the Alliance, but also problems of the east side. Our intention is to develop the responsibility of citizenship, if not with the old people, at least with the young people, and after 10 years of hard labor we have the satisfaction to see that the young people have become interested in our own work, and I know they are interested in the work of the neighborhood. We make it a feature to celebrate all legal holidays. The majority of the people residing on the east side do not know the meaning of the legal holidays, and we make a special effort to reach the older people at such celebrations. For instance, on the Sunday before election day we had a meeting in the large auditorium. We had two lectures. One was by Professor Giddings, of Columbia University. He spoke in English to the younger people on the responsibility of citizenship. They were impressed with the importance of citizenship, the duty to vote, but of course not told how to vote. Then another one spoke to the older people in Yiddish in the same way. While I am speaking of this meeting I might mention that we do not interfere with the internal affairs of our social and literary clubs. They are allowed to discuss any subject on earth. They may discuss politics; they may discuss the question of gold and silver, but they must not be personal. They may discuss the question of Tammany Hall or corporations, but they must not mention names when they hold such debates.

We also have in the summer what we call our "roof garden," when the general work is closed, and it is the greatest attraction for the people in the summer to keep our children from the streets. We have kindergartens there, and the children are instructed in quiet games. We can accommodate on our roof about 500 people at a time, and the roof is always filled from early morning until late at night. After sunset the adults begin to come, and then we have music, and stereopticon views, especially devoted to American geography. We make a great effort to acquaint the people who come to us with the resources of America. We want them to know the names of the States and the facts of the different States, and in this way we may sometimes encourage probably immigration from New York into the interior States.

Recently we have introduced a new feature in our work. We hold receptions in the building for immigrants who have recently arrived. We have no way, of course, of reaching them all, but it is pretty well known, and when they come we tell them of the differences between Russia and America. I happen to be a Russian myself, and of course I know the differences, and I find that such talks work very well. The building is in the center of that neighborhood. It is a very large building—5-story building on a corner, seen from all sides—and people go there for everything. They consider it an encyclopedia, and come for all kinds of information.

We draw a sharp line between charity and education. I may sometimes learn of a family in distress. For instance, young women want to learn dressmaking, so as to be able to support themselves, or some wish to study. They need something to live on meanwhile. When this happens I refer their cases to the United Hebrew Charities without telling the young women I have done so. I decline to speak to people about pecuniary assistance. Our main object is to teach them to help themselves, and we do not want to give them the least impression that we give pecuniary assistance; so this is the reason why we call ourselves the Educational Alliance.

Q. Most of these people are inclined to be self-helpful, are they not?—A. They are, but still some of them misunderstand. Formerly this place was called the Hebrew Institute. Four years ago it was changed from the Hebrew Institute to Educational Alliance, and that was in order to give it a more nonsectarian name. Some people of the neighborhood do not understand exactly. Some think it is a public institution; others, again, think it was endowed by Baron Hirsch, and often call it by that name. Very few know it is supported by the Hebrews of New York.

Q. (By Mr. KENNEDY.) You told what you do on the Jewish Sabbath. What do you do on the following day?—A. We have social work. If there were a demand for it we would not hesitate for a moment to have services for another denomination, but there is simply no demand for it. It might even cause a little disturbance at first if we dared to introduce it; but from our point of view we would not hesitate to do that, because we are nonsectarian.

Q. (By Mr. LITCHMAN.) Is your work simply in scope and effect the same as what are known as "social settlements"?—A. It is, and it is not, for the reason that we do not have resident workers. We open in the morning and close at a certain time in the evening. It is not a social settlement, but we do cover work the same as a settlement. Some thought we should call our place the People's University.

This, gentlemen, is in a general way our work. Now, if you care to ask me questions as to my observations I shall be glad to answer them.

Q. (By Mr. CLARKE.) First, let me ask you if you know of any similar helpful educational work in any of the countries from which these people emigrated?—A. No; I can even tell by an experience I had last summer in Europe. I myself have been in this country now 13 years, and I was last summer in Europe and met brothers of mine in Germany, and I could not explain to them what I was doing in America. They simply could not understand me, the conditions are so different.

Q. Do you find that this work is interesting your people in America? Are they eager to understand our institutions?—A. Very. The reason for it is, as soon as they come here—they are different from other immigrants—they leave Europe behind them; they burn, so to say, the bridges behind them, and they can not go back to Russia. I myself can not go back to Russia, even if I want to, because I left Russia before I was 21 years old, and have become an American citizen, which is in Russia a political crime. The Secretary of State would not promise me protection in Russia when I went back there.

Q. (By Mr. FARQUHAR.) Do you owe military service to Russia?—A. Yes; I do. It is different with the German Jew who comes to America. I think he thinks yet of Germany, and it takes quite a while before he forgets it, because he is, after all, treated as an equal in Germany. But I am speaking mostly of immigrants coming from eastern Europe, who create a problem here.

Q. Is there a feeling of love of native land in those Jews who emigrate to this country?—A. Yes; there is a love in so far as it concerns Jewish life. Even here the Jewish life is somewhat different. For instance, take a Russian, or the Galician, or the Roumanian, and they have their own centers there, and it is easy for them to observe the Jewish rites, while it is very difficult for them, indeed, here, for instance, to observe the dietary laws and keep the Sabbath. The economic conditions are so different here that it makes it difficult for them to observe it, and they feel a little at a loss at first. Of course, we have other problems. I simply explain to you what we are doing, but indirectly we touch upon a number of other things. The change of the conditions has a peculiar effect upon the minds of the people. Take, for instance, the Russian Jew who comes over to America, coming as he does from a country where he is really not allowed to think for himself, and within a short time he is transferred to a country where he is even allowed to act; the reaction is then very great. I studied the immigrants in Boston and in Providence before I came to live in New York City, and I found that reaction at first is very great. They can not for one moment associate liberty with law. That is at first the same way about religious life. Of course, at home they were so steady that they could not help being religious. They were at a material disadvantage if not religious at home. For instance, if a Jew should keep his store open on the Sabbath in a town in Russia or Poland he would be at a material disadvantage because of it. Now, when he comes to America, he finds he is at a material disadvantage if he keeps it closed. There is that difference. I shall never forget the impression it made upon me, although I lived in Germany before I came here. Take a Russian who is accustomed at home to consider Czarism to be divine; when he comes here shortly before election and reads the campaign literature and listens to stump speeches—now, you can not imagine what effect it has upon him to see how the head of the nation is put to ridicule, or caricatures are made of him. The result to him is that he loses all

respect for authority. He thinks if this is the case, if the President of the United States can be ridiculed, then there is no authority, and the result of it is, the policeman or higher officials mean nothing to him. At home he is afraid of the brass button, but here it means no authority at all. In dealing with immigrants we must bear all of this in mind.

Q. (By Mr. LITCHMAN.) How soon does the change come over the people?—A. I have studied about 10 individuals and took great interest in them. As I really was interested in their welfare. I know a young man who is now occupying a prominent position; when he first came he was anarchistic to the extreme. A few years later he became socialistic, believing in philosophic socialism, and now he is a conservative citizen.

Q. (By Mr. KENNEDY.) Has he joined a political party?—A. He has already joined a political party. He was a Bryan man during the last campaign.

Q. You spoke about believing in the divinity of Czardom. Do the Jews believe in the divinity of the Czar?—A. They are accustomed to look at it so. The religion, probably, of the Jew does not teach it, but it is the general feeling in Russia. They speak of the Czar with the greatest reverence.

Q. (By Mr. LITCHMAN.) Do you find any improvement in that condition in the immediate generation of immigrants?—A. Great. The second generation is fully Americanized.

Q. That is, similar in position and instincts and actions to the second generation of other classes?—A. Yes. Now, as I said, we do not directly touch these questions, but we will discuss social problems; and we will have lectures on the philosophy of anarchism, and the philosophy of socialism, and the young people attend those lectures. They are given in the languages the people speak and free discussion makes them change. One of our classes in our building is composed of about 200 young people, and I remember 2 years ago every one of them was radical. Recently, however, they have changed.

Q. (By Mr. CLARKE.) You mean by that they were anarchists?—A. Anarchists in theory. They were discussing free love, and did not hesitate to discuss any subject in the world; but they have changed around, and have become imbued with the spirit of patriotism and altruism.

Q. With the increasing knowledge of freedom they have increased the sense of responsibility?—A. Yes; so it is. In Russia these very same people were not allowed to express themselves, and an argument was always silenced by being imprisoned, and they therefore did not believe that the other side would ever give them a hearing; but the fact that they have a fair hearing with us changes them in the course of time. They learn to see the other side.

Q. Is there much desire among the adult immigrants to learn the English language and become acquainted with American institutions?—A. Very much. I can only say that we did not announce that we were going to have evening classes for adults early in October a year ago, but the night when the public night classes opened up our building was mobbed. There were probably 2,000 people who came and asked to be admitted to our classes, and every one of them not less than 35 years old—not one of them younger than that.

Q. Is there any noticeable improvement in habits of dress and wearing the hair and beard after a short residence in this country?—A. Yes; I think it was very wise, this requirement of 5 years before becoming a citizen of this country. I really observe that this is the case. Our records of the United Hebrew Charities show that too—very seldom do they have applicants for charity who have been in this country more than 5 years. And the people—if you see one of them on the street respectfully dressed you can be assured that he has probably been in this country 5 years. They do change radically in 5 years, so much so that there is a great deal of trouble caused if a man comes here alone first and lives for several years and becomes more or less Americanized and then brings over his family. He is already far removed, far ahead of his family, of his wife and children, and the result of it is there is a disagreement at first.

Q. (By Mr. LITCHMAN.) Would an educational qualification restrict immigration of the people of whom you are talking?—A. It would depend. That is, to read or write one language?

Q. That is, to read the same language?—A. It would never debar them.

Q. It would not?—A. It would not. It would not affect them.

Q. They can read and write in their own language, as a rule?—A. As a rule; that is, Hebrew, not Russian. They may be Russian by nationality, but they will not necessarily know the Russian language; they may neither speak nor read that language, but they will read and write Hebrew.

Q. (By Mr. CLARKE.) In what industries are most of the people who come to your institution engaged?—A. Mostly working in factories. Some of them are petty tradesmen in the neighborhood. The younger people work either in fac-

tories or in stores. The older people will be small traders of the neighborhood, peddlers, etc.

Q. In what particular line of manufactures are most of them engaged?—A.—I do not think I can give you a definite answer to that. I am studying that very same question, but I can not give you an exact answer. It varies.

Q. Are many of them in what are called sweat shops?—A. Yes. The sweat-shop people we only get on Saturday and Sunday, on the days when they rest. The shop closes on Saturday, and closes earlier on Sunday. Then we have a very large number of sweat-shop people.

Q. Are the sweat-shop people who come to your building of the poorer class of those who are industrially employed?—A. Yes.

Q. Have you had occasion to investigate their work and the conditions under which they perform it?—A. I have, to a certain extent. It might interest you to know one of the causes for the sweat shops among the Jews, and that is the strict observance of the Sabbath. When a Jew comes here and wants to go in a factory, he is at first confronted with the difficulty of the Sabbath, and he prefers, of course, remaining true to his religion to getting work; and there are some individuals who take advantage of that, and they say to these people, You want to observe the Sabbath? Yes. We will give you the opportunity. You will work for us, and you will work at home, and you will then do your work and suit your own convenience. I think this is one of the main causes why the Jews of the east side have taken to that trade. Have I made it clear about the causes why some of the Jews of the east side have taken to the sweat shop? It is because of the strict observance of the Sabbath.

Q. (By Mr. LITCHMAN.) Do I understand that the employers seek them and hold that out as an inducement?—A. Yes.

Q. Do you find that the second generation are as strict in the observance of religion as they are in the first?—A. No; they are not.

Q. Not less so, however, than the second generation of other people?—A. Yes.

Q. (By Mr. CLARKE.) Are those of the second generation willing to work in factories on the Jewish Sabbath?—A. They do.

Q. Does that lead them away from all religious interest, connection, and restraint?—A. This is quite a problem which we, by our religious classes, endeavor practically to solve. For instance, we impress upon them the importance of a day of rest, not exactly which day of the week. Just on account of their religious traditions there is a great conflict between the older and the younger generation.

Q. (By Mr. FAQUHAR.) Does not the poverty of the immigrant drive him into the sweat shop often, even more than the Sabbath?—A. You mean draws him into it?

Q. I mean drives him into it.—A. To a certain degree it does.

Q. What other employment is there open to him in the city of New York besides the sweat shop—to a Jew who comes here without a trade?—A. He will open up a little store right on the east side.

Q. I mean the poor Jews.—A. They will have a stand; peddle.

Q. But all can not peddle.—A. All can not, but the larger part do.

Q. Then what do the others do?—A. They do work. The older members of the families work in factories.

Q. Would you say that the orthodoxy or strictness of the religion was the main reason for driving them into the sweat shops, or that the poverty of the immigrants drives them into the sweat shops?—A. I should say that the Sabbath enters more into it than even the poverty.

Q. Have you examined into the condition of those people that are in the sweat shops?—A. I have.

Q. In respect to the wages they earn and the condition of their living?—A. Yes.

Q. And if the small wage earned there keeps them in that perpetual round of labor and long hours?—A. In a general way I have investigated, and I have found it is the small wages that keeps them there.

Q. (By Mr. PHILLIPS.) Were these people before they came over here engaged in the garment-making business largely?—A. No; very few of them.

Q. They learn that after they come here?—A. Yes.

Q. Are there many agriculturists who come here?—A. Very few.

Q. Of your people?—A. Very few. The Jew in Europe can not be an agriculturist.

Q. What is the chief occupation of the masses that come here—in the foreign countries, I mean?—A. Well, you take people that have a trade, say shoemakers—when they come here they can not pursue their work on account of the factory system here. The same is true of tailors at home. They may open up here little

shops, but they can not compete, just the same. You will find a great many of them have trades.

Q. What trade do they more generally take to?—A. They will be generally tailors, shoemakers, carpenters, painters. I think those would be the main ones.

Q. (By Mr. LITCHMAN). Do you mean that is the trade in the countries from which they come?—A. Their trades in their countries from which they come; but they can not compete with the factory system here; can not open up a shoe shop; can not open up even a tailor shop; have to go to work in the factory at first.

Q. By reason of the different method of doing the work?—A. Yes.

Q. (By Mr. FARQUHAR). Do they not start in the manner of mending in the shoemaking trade, and also cleaning, repairing, and everything of that kind in the tailoring trade?—A. That will apply to the people who do not want to work in the factory for a twofold reason—either it is self-respect and they do not want to fall into the line, and another is the Sabbath.

Q. (By Mr. PHILLIPS). Were not a large number of those who come small shopkeepers before they emigrated to this country?—A. Yes, they were.

Q. (By Mr. CLARKE.) Are the sweat-shop workers almost wholly Jewish?—A. I do not think they are wholly Jewish. I think that the Italians have the larger share of it. That you can see when you walk through the streets and see the people carrying the bundles. You will find more Italians than Jews.

Q. They are nominally Christians, I suppose?—A. You mean the Italians?

Q. The Italians.—A. Yes; nominally Christians.

Q. Therefore the Sunday question would not account for their being in this trade?—A. No.

Q. (By Mr. FARQUHAR.) If you have said what you want to on the sweating matter, take up the condition of the Jewish immigrants that come to New York City, and state what provisions you have there in New York to meet their wants, care for them and educate them.—A. As a rule, when one comes he will find a relative here, and the relative will take care of him—will probably give him a little something to start in life—often share rooms with him for the first few weeks or months until he settles. If the relative is not strong enough to take care of him, they have a little colony of their own either from the same country or even from the same city, and they have little societies where they assist newcomers; and that will be the case for the first 6 months or so. And if even this society will not be able to take care of the immigrant, they will then refer him to the United Hebrew Charities. The United Hebrew Charities, as a rule, do not take up cases of recent arrivals. That is the way the process is. Their first help will be some individual, and then there will be country people, and then they will go to headquarters if they can not support themselves. Now, this is also proven by the records of the United Hebrew Charities, that very seldom do they have any applicants of people who have been more than 5 years, or even those who have been more than 2 years in this country. It looks as if, after they have been here for 2 years, they manage to get along by themselves.

Q. Are any or many of the Jewish individuals or families receiving public support in New York City?—A. From the public at large?

Q. Yes.—A. Very seldom.

Q. I mean public support out of the State?—A. That is, the nonsectarian charities?

Q. Yes.—A. A very small percentage.

Q. Is it the intention of the Hebrew charities and organizations like your own to provide for the wants of the immigrant and the Jewish local population?—A. They do not deal with immigrants, as I said. Even if an immigrant goes to them for assistance they will refuse to assist; and if he should insist, they will refer him to the authorities to be sent back to Europe rather than allow him become a public charge.

Q. The main dependence of the immigrant, then, is on family relationship?—A. On family relationship.

Q. (By Mr. KENNEDY.) They would not report a Russian Jew to the authorities to be sent back to Europe?—A. Oh, yes; they do occasionally.

Q. They do?—A. Oh, yes; they do if he becomes a public charge. Say an immigrant has not been more than 6 months in the country, and he goes up to the United Hebrew Charities; they will first offer him work, and if he is not able, or they, in their opinion, think he will be a public charge, they will report him to the authorities, and he is sent back.

Q. (By Mr. PHILLIPS.) What would he do when he went back to Russia, for instance—would he be admitted?—A. He will be admitted in the same way as he left Russia; he smuggled through when he left, and he will have to smuggle through when he goes in again. They do not leave Russia in a legal way. It is difficult to leave Russia.

Q. From what country or countries do the most intelligent and thrifty Jews come to this country?—A. Mostly Russia and Roumania.

Q. They are more intelligent and more thrifty— A. (Interrupting.) Yes.

Q. Than the German and the English?—A. The German Jews—they come in such small numbers. We very seldom think of German Jews coming over to America and creating any problem.

Q. (By Mr. KENNEDY.) You classify them as Germans rather than Jews?—A. As Germans rather than Jews.

Q. (By Mr. FARQUHAR.) What impels the immigration from Europe—the governments there or the benefits they derive from immigration?—A. Mostly the laws against the Jews.

Q. Oppressive laws against the Jews?—A. Oppressive laws, yes. Now, this I studied last summer in Roumania. I went there purposely to find out the cause for the large Roumanian immigration. You have no doubt heard about it during the past summer. About 12,000 have come to America and about 50,000 are roaming around the whole of Europe. I was in Roumania in the latter part of August and the early part of September, and have seen with my own eyes the conditions there, and arrived at the conclusion that they could not exist there. For instance, they have laws there that a Jew—a Jew is called an alien. They are not allowed to make laws against the Jews, according to the Berlin treaty of 1878, but they simply call a Jew an alien, although he has lived there for centuries. I have seen a man in Bucharest, 84 years old, whose grandfather was born in Roumania and whose grandchild has served in the Roumanian army, who is nevertheless called an alien, and, although he is 84 years old, he may be expelled at any time as an alien. As an alien he is not allowed to hold public office, and public office in Roumania means even to work on the railroad as a porter, for the railroad is owned by the Government. He can not work in a telephone or telegraph office. He is not allowed to sell cigars or liquors, because it is all a monopoly of the Government. So the Jew is debarred from that. The Jew, or an alien, as they call them there, is not allowed to reside in rural districts, but is confined to the cities. How can he take to agriculture if he is not allowed to reside there? And the worst of all is that the children of aliens are not allowed to attend the public schools. I have seen in the city of Bucharest as many as 10,000 Jewish children walking the streets during school hours. Of course the Jews there try to have schools of their own, but you can imagine how they are situated. They are poor. It is not because of their own fault, but simply because of the laws; and they can not provide schools for all their children. Now, this is the cause of the Roumanian immigration.

Q. (By Mr. LITCHMAN.) How do you harmonize that statement with your previous statement that the most intelligent Jews come from Roumania?—A. This is a law which was issued since 1893. Education was given to them previous to 1893. But what will become of those children who do not attend the public schools now? I had a talk there with a Government official, and he admitted it. He said it was intentionally done. The Jews were competing with them, and so they issued the law that no aliens are entitled to public school education, and they think in this way they will be better able to compete with the Jewish intelligence.

Q. And drive them from the country?—A. Drive them from the country. As many as 50,000 left Roumania between January 1, 1900, and August 1. They were all given immigrant passports; that is, they allowed them to leave the country, never to return.

Q. (By Mr. FARQUHAR.) Did they principally immigrate to the United States or to South America?—A. They originally wanted to come to the United States, but after 117 were detained at the Barge Office in the middle of June they stopped coming to America. Oh, that frightened them. I saw that all over Europe. They wanted to go anywhere except to America then. They were afraid of the law. While it is true that 50,000 of them have left because of the conditions there, at the same time I found out that agents of steamship companies were largely responsible for that too. They circulated there a rumor that golden opportunities were waiting for them in the United States and in Canada. I even procured one of such circulars written in the Roumanian language, and I am now trying to have someone to translate it for me, in which they tell of the great opportunities in America and in Canada; and that created a great excitement in Roumania.

Q. Could not we obtain a copy of that if you succeed in translating it?—A. I have only one copy of it, and I placed it in the hands of a Roumanian to translate it.

Q. (By Mr. PHILLIPS.) Can you send this commission a copy after it is translated?—A. Yes.

Q. (By Mr. CLARKE.) What you say about the steamship companies will apply to other countries as well as Roumania?—A. You can not in Russia. You can

not circulate your circular or your visiting card without submitting it to the censor; it is impossible to do it in Russia. But in Roumania, where they have the freedom of the press, it was very easy for them to do it.

Q. Did you look into the subject of crime in Roumania so as to study whether or not the oppression of the Jewish people and their lack of liberty and opportunities drive them to crime?—A. I did, and I was pleasantly surprised to find how they held their ground in spite of all this. Of course, while the oppression there is old, yet the restrictive laws have been enforced only for the past 3 years, and no one can tell what the effect will be a few years later. But so far they have stood the test of the oppression and they have not been driven to crime. When I asked the people, "Why do you want to go to America?" the unanimous answer was, "In order to give our children an education."

Q. (By Mr. LITCHMAN.) Do you know if any other inducements were offered for that class of immigrants to come to America, other than by the steamship companies?—A. No; I do not know of any.

Q. Or by any other influence than by that of the steamship companies?—A. I was told—I was not able to ascertain whether it was so or not—that the Zionist—no doubt you have heard of the Zionist movement?

Mr. PHILLIPS. It is very small yet.

The WITNESS. Yes; and I do not think this is true; it may have had something to do with it, but from the conversations I had with the people I found it is not the case. They say that some Zionist agents were there in Roumania to stir up the people to emigration, so that the Jews of Europe should become convinced that there is no salvation for the Jew but to go back to Palestine. That has been stated, but I do not believe it myself.

Q. (By Mr. FARQUHAR.) Have you among the Jewish people much of this family-assisted immigration, by the immigrant who is here furnishing the transportation to the Jewish family at home, or part of that family?—A. Yes; to a very large extent. As a rule, one will come here—say a family in Russia or in Roumania; the older member of the family will come first, and he will come here and deny himself of all comforts and save a few dollars, and then buy a ticket on the installment plan here—they have quite a number of such offices in New York City—and he will send for one member of the family, and then when they get together here they will send for a third one. Only last Saturday night 4 young women came to my office and asked me to give them a letter testifying that they are here in America, and they also brought me testimonials from the people with whom they work that they can support themselves here and that they will be able to support their old parents, so that the authorities in Hungaria should allow their parents to pass, for during the large immigration during the summer the Hungarian Government protested against it and forced the Roumanian Government to readmit about 10,000 of those who had already left Roumania on the immigrant passports. When they came back they were not allowed to enter the country again, but the Hungarian Government forced them to readmit them. And since then a Roumanian, trying to get into Hungaria, must show that he has a ticket direct to America; and, furthermore, they also require evidence that he will not have to be sent back from America. And these 4 young women asked me to give them a letter testifying that they are in New York and that they could take care of their parents when they came here.

Q. (By Mr. KENNEDY.) Did you give the letter?—A. No; I did not. I do not want to encourage such immigration. I said they should write to their parents and their letter should be shown on the frontier there, but not an official letter from me. I told them that when their parents arrived, if they, the daughters, would go to the Barge Office and their employers would testify that they work, they would have no difficulty in landing their parents.

Q. (By Mr. LITCHMAN.) Does your association consider the moral aspect of encouraging immigration?—A. I must ask what you mean by that?

Q. I mean by that protecting an immigrant girl, for instance, from going astray immediately after landing in this country?—A. Yes; we do. We cooperate with another society in New York City. It is called the Clara De Hirsch Home for Working Girls. It is an institution intended to take girls who have no homes. If they have work, then they give them board and lodging for a small compensation. If they can not find employment, they have some work for them there. They train them for domestic service especially. And the Clara De Hirsch Home has an agent, who is also a representative of the United Hebrew Charities, in the Barge Office, and if a girl comes here without relatives he will refer that girl to the society.

Q. So that you keep a watchful care over her?—A. Yes, yes. I must say that I tried to study while I was abroad, and especially in Roumania, as I had some indirect information that it came from that country, but I have not been able to

find it out—that is, the trade with girls. I understand that there is a large trade carried on, and I have even been told that it comes from eastern Europe, and quite a number from Galicia and from Roumania; but I was not able to find it out.

Q. (By Mr. CLARKE.) Do you believe it is true that there is any such trade?—A. I do believe it, but I have no proof; it is simply an impression. That, of course, is proven by the large increase of immorality on the east side.

We have a new problem on the east side, and that is the increase of immorality. There is an increase of it, and it is an evil which is not new. It is an evil which has been imported, probably from eastern Europe, but the worst of it is that these women are to be found in the tenement houses, in the houses where there are children, and they even go so far as to make the children their agents. The children distribute cards for them, and that is having, of course, a very demoralizing influence upon the rising generation.

We have set everything in motion to suppress that evil. It is not to stop it altogether, but to purify the tenement houses. We had mass meetings where we tried to arouse public opinion, but all our efforts were of no avail; and this is due to the corruption of the police of New York City. It is very hard for us to get evidence. A person may go past a house, be solicited, and a child may hand him a card, and then when he goes to the police he gets no satisfaction.

We have a committee, at the head of which is Professor Adler, and Bishop Potter is also represented, and I myself represent the alliance, and we have meetings, and we have a special agent, a lawyer, who studies these cases, and although we have been in existence since last December we have not been able to get one case yet before a court, and we have judges on the committee; this is simply due to the corruption of the police.

Q. (By Mr. KENNEDY.) Are these women from Europe?—A. Yes; most of them.

Q. Women of the Jewish race?—A. Mixed.

Q. (By Mr. FARQUHAR.) Not one or another?—A. Not one or another.

Q. (By Mr. LITCHMAN.) Not a case in court?—A. Not a case in court. They can not bring it to an issue in court. It is true that sometimes, if we bring pressure to bear on the captain of the station, he will for a short time tell the disorderly women that they should not be so conspicuously seen on the street, but that is all. That is as far as we can bring it. We have not been able to close up one place yet.

Q. (By Mr. CLARKE.) Is it your opinion that the police levy tribute on these people?—A. That is the opinion. There is a regular system. The roundsman gets his pay. They do not give the money directly to the captain. They have saloons, and the proprietors of those saloons are the mediators between the police and the people.

Q. Have you ever gone over the heads of the captains and made complaint?—A. We have gone as far as the chief of police himself, but it was of no avail.

Q. You think he is in the conspiracy with the rest?—A. I do think so. I think there is a regular system of corruption there. Of course, this is not the only evil. This is one of the many evils of the east side. We have gambling now to a very large extent.

Q. (By Mr. KENNEDY.) Are these evils new on the east side?—A. Altogether new.

Q. How far east of the Bowery do you mean when you speak of the east side?—A. From Houston street. It is south of Houston street and east of the Bowery, going down away to the Battery.

Q. I should think those things were not something new in the region of the Bowery.—A. For instance, Allen street, which is well known for it, beginning with Houston and running into Division—I think there was not any immorality there 6 years ago—and such streets as Forsythe and Attorney street, all streets that are largely peopled by Jews. Now, this evil is new both for the Jew and for the east side. No matter what has been said in the past about the Jew, it has never been said that there was immorality among the Jews, and this is altogether a new feature with the Jews.

Q. (By Mr. CLARKE.) You do not mean to say that the evil has not existed in that part of New York until within recent years, but that it has not existed among the Jews there?—A. It has not existed among the Jews; yes.

Q. (By Mr. LITCHMAN.) Do you mean that this evil has gone into the tenement house rather than into the separate house of prostitution?—A. Yes; that is what it has.

Q. It has been driven out of the house of prostitution into the tenement house, or do both exist?—A. Both exist.

Q. And so far as your observation has gone, it is new in the tenement?—A. It is new in the tenement; that is what it is. It is new in the tenements of the east side, and it is, of course, altogether new with the Jews.

Q. (By Mr. CLARKE.) Is it generally believed by the reformatory Hebrews who are trying to elevate their race in New York that the police are corrupt, and that it is next to impossible to prosecute crime to effect?—A. The reform is not only on the side of the Jews. This is a nonsectarian movement to purify the east side, and it is the unanimous opinion that the police are responsible for it.

Q. Does such demoralization of the police have any noticeable effect upon the estimate among your people of American institutions?—A. To a very large extent. That is what I meant before in speaking of the difference between the governments abroad and the Government here. They judge of the nation as a whole from these corrupt officials.

Q. (By Mr. LITCHMAN.) Do you say that they get their ideas of the President of the United States from their experience with the tenement-house captain of police?—A. That is a great deal to say.

Q. (By Mr. KENNEDY.) Do they consider that they have bettered their conditions by coming to this country?—A. Whether they better themselves materially?

Q. Yes.—A. Yes; but if you speak with the people they will all tell you that materially they are better off, morally not. This is the unanimous opinion of the people. They regret the fact that they can not live up to their moral convictions here.

Q. You say that the Jews were not under those influences before; they did not patronize the social evil or gambling. Now, isn't it a matter that is in their own hands altogether?—A. That is also due to their views of life as they lived at home. I once spoke to an elderly man from Russia, and I said to him, "You are partially responsible for the existing conditions. Why don't you exert your influence?" He said, "This is a matter of the government." He is yet accustomed to the idea that the government must do everything—that is, the paternal form of government in Russia. It is hard for him to understand that the individual citizen is responsible and the individual citizen can improve it.

I really do not deal with economic problems directly; but I thought you might probably ask me something on immigration as a whole; for instance, about restriction. I personally do not favor the idea of restriction of immigration. As a rule, the immigrant who comes here is of an adventurous disposition, and I think that in itself is useful for the country. Take those who come here because they can not stand the oppression abroad; they bring the germ of liberty with them right here, and they are good subjects of the American nation. Immigration, it seems to me, is the food of the nation; it is the fuel of that great furnace. Of course, I have no plan to suggest; but I simply wanted to say in a general way that a system should be devised whereby the immigration should be distributed. I think the great evil is the large-city life. During the past year as many as 40,000 Jews have settled in New York City—immigrants. This is more than New York can stand, more than New York can digest. There ought to have been a system whereby they should be distributed; say, for instance, New York should take in so many immigrants every year. It should not be that all should land in New York. They should come to Philadelphia, Baltimore, Galveston—open up new ports. They should not all enter through New York City. And, furthermore, we should have probably a commission, something like a transportation and employment bureau, to be under the supervision of the Immigration Bureau. It would be contrary to the principles of the United States to dictate to a person where he should go, but still a person could be advised. After the immigrant has passed the formality of going through the Barge Office, he is left to himself. I think that as the American nation is based on humanitarian principles, and finding that immigration is important and necessary, the immigrant should be cared for. It seems that the immigrant, when he comes to America, is just like a child born into the world. The child is protected and looked after. It would not take so long for the immigrant, probably, as for the child, to learn where he is; but the immigrant should not be left to himself. For instance, I would suggest that, just as the child is expected to attend the public school until a certain age, so should every immigrant, if he had no education abroad, be expected to attend the night schools, and probably that no naturalization paper should be given to an immigrant unless he presents a certificate that he has either attended school in Europe or has been to a night school, and that he has really become acquainted with American institutions. The examination that they have to pass when they take out their papers is a farce as far as I have seen it. But the standard of the naturalization should be raised; it should be difficult to become naturalized. The test should be familiarity with American ideas.

Q. (By Mr. KENNEDY.) Wouldn't it be very difficult in the case of men 45 or 50 years of age to acquire this knowledge necessary to qualify them for naturalization?—A. Even if it should not be given in the English language altogether, it could be given to him in his own language, and he should be imbued with the American spirit. I think it would not be out of the way if, for instance, litera-

ture in the different languages should be circulated in the seaport cities and New York, and the steamship companies should be obliged to have such literature to give to the people to read, to be prepared before they get to America to understand where they are going. We can translate, we can have a general introduction telling them of the differences between Europe and America, telling them of what to expect here, and so on. For instance—I will give you one impression of my own. I could not understand when I first came to America the importance of sport as the American sees it. I came here during the time when John L. Sullivan was in his glory. I really could not understand why the children of the city of Boston, that city of culture, spoke with such admiration of John L. Sullivan. I could not understand it. I saw the American nation giving honors to that man. As another instance, take the press. I remember when I was a boy in Russia, when one would tell a fact and it would be doubted he would produce a copy of a paper and say, "Here it is in the paper," and that was sufficient proof for his statement. Now to-day the immigrant becomes bewildered when he first comes here to America. As a further illustration, take organized amusement. I call it organized amusement, the way we have picnics, balls, assemblies. The people who come here mostly from eastern Europe are not accustomed to such life. If they have any amusement or gathering it is a birthday party, it is a wedding party, and a funeral; it always centers around the family. But this large scale of amusement, taking out people on excursions by the thousand—when he comes here he becomes bewildered.

Q. (By Mr. PHILLIPS.) Do they call a funeral an amusement over there?—A. No; but it is a social function; the people come together. When the people come together for religious work and for family affairs, they do not have amusement in the sense of the word as we have it here. Now all this should be explained to the foreigner when he comes here, and it can be done by a little pamphlet printed in the foreign languages. While he is on board of the ship he can read it, and it should be given to him free. It would not be, I think, out of the way if the immigrants, when they get here, as long as they have been 10 days on the water, should be detained for another day, and there should be some large hall where all the immigrants should be landed and assembled and addresses made to them welcoming them to the country, and to introduce them to the American life. But it seems they are not taken care of here and they are lost.

Q. (By Mr. PHILLIPS.) Would not that induce a very large per cent more of immigration into this country?—A. It would cause a rise in the standard of immigration itself. I think our laws, if they were carried out to the letter, would be sufficient. They cover the test of literacy and other tests. If they were to be examined, I think that would cover the whole matter.

Q. (By Mr. LITCHMAN.) You spoke of 117 immigrants being detained.—A. Yes.

Q. Can you state the cause of that detention?—A. Their passage was paid by a charitable society on the other side.

Q. Oh, because of prepaid passage?—A. Yes.

Q. It had nothing whatever to do with any qualification of education?—A. No. I was present in the Barge Office when they were all examined, and they thought it was a great thing. They said the Baron De Hirsch committee paid their fare.

Q. (By Mr. KENNEDY.) They were trained on the other side?—A. They thought if they would say the Baron De Hirsch committee that would help them.

Q. You spoke about the Government exerting an influence to distribute this immigration. Wouldn't it be a very considerable problem for the Government to distribute the Jews, for instance; to keep them away from the large cities and send them to the smaller cities?—A. I think when the immigrant first comes here he is just like a child; he would yield; he would not raise objections. He would be a stranger wherever he would go.

Q. You spoke about that 40,000 of them in New York City now. Wouldn't that 40,000 attract great numbers of others?—A. Yes, they will; but those 40,000 ought not to be allowed to settle there.

Q. There were 40,000 before there?—A. Yes, but this 40,000 that came from Roumania have no relatives here at all, probably. If they would come to Galveston, or some other port, it would be a long time before they came to the Eastern cities. To cover the additional expense and additional labor the per capita tax could be raised.

Q. Do any of the Jews go to the Northwestern States to engage in agriculture, as the Swedes and Norwegians do?—A. No effort has been made. I have here a letter written in German, which I received. It was sent to me in New York from Bucharest, in Roumania. I am told in it that a Government official from Canada was there who made a proposition to take over 20,000—he was authorized from the Canadian Government—if they would go there to pursue agricultural work;

and he has even submitted a plan to them how he would gradually take them over; first, one out of a family, and after a year he should send for the other members of the family. I am informed in this letter they will send me all the data about it. There has simply been no attempt made. I have no doubt if it should be regulated and if the Government should in some way direct it they would in course of time take to agriculture.

Q. Have the Baron Hirsch people made no effort to induce them to go into the Northwest?—A. Not in that organized way that the Government could do it. They have done it to a very small degree. They do not have the power and the authority which the Government would have.

Q. (By Mr. LITCHMAN.) You think that immigration should not be restricted?—A. That is my opinion, and I think it would be detrimental if they should not be allowed to come here.

Q. Have you any objection to the industrial complications arising from competition?—A. It only arises in the large cities, always in the large cities. And I say they should not probably be allowed to land in the large cities; they may be required to purchase their tickets direct to the interior States.

Q. You think the evils complained of would be largely prevented by a wider distribution of immigrants?—A. All of this question of immorality is caused by the large aggregation of people in so small a locality as the east side of New York.

Q. Wouldn't there be political complications? If the Government should take a hand and try to force the Jews in the cities of the East to go to the West or cities in the interior, might not your people rise up and protest?—A. The Jews might protest if there should be laws against Jews, but if there should be a law passed by Congress for all immigrants, I do not think the Jews would be against it. The Jews are always against making exceptions of them.

Mr. A. L. HARRIS. Have you anything further?

The WITNESS. I do not know whether it comes in the line of your inquiries, but living as I do on the east side of New York, I just jotted down a few of the needs of the eastside. For instance, we have no parks. We ought to have some small parks. I should say that in a place like the east side of New York every ten blocks there should be a little park. We ought to have more public baths and playgrounds, which the children do not have there. And as a remedy, a partial remedy, as an experiment, for the sweat-shop system, I think if philanthropists do not do it the Government might undertake to erect public shops. It would have an educational as well as an economic advantage, and it would meet the requirements of the sanitary question, too.

Q. (By Mr. LITCHMAN.) You do not mean for the public to run the shops?—A. Oh, no; but to erect them.

Q. (By Mr. FARQUHAR.) Furnish power and heat and everything?—A. Power and heat and everything, and those people who work in their own homes would be willing to pay a moderate rent.

On the question of immorality, I had an idea—and I already tried to interest some philanthropists in New York City—that they should erect more hotels like the Mills Hotel. The great trouble on the east side is the boarder trouble. There is not a family in New York City on the east side that does not have one or two boarders, and there they all live in the same rooms. There the trouble begins. If they were to have more hotels of this kind, so that the boarder should not be obliged to live in private families, I think that would also help the question of immorality. I visited in Germany some tenement houses, what were called model blocks, especially in Frankfort on the Main. If we were to have such tenements in New York City, I think we would not need institutions like the Educational Alliance, probably. In their own tenements they have all these advantages. They have little libraries and little assembly rooms and places for study for the children; and they have even placed kitchens right there, and 100 families cook and live there. When I was there I could get but little literature, but as soon as I receive it I would be glad to forward you a copy of their report. To my knowledge there is not such an institution in the whole of the United States.

Q. (By Mr. CLARKE.) Who build and who owns those tenements in Frankfort?—A. Private individuals, who invested their money, and they have 4 per cent interest on it, but they conduct it on a very democratic principle. The people who occupy those houses administer their own affairs; the company only draws the interest on the money. Whatever goes above the 4 per cent is turned into a sinking fund for all improvements; and they have their trustees, and they feel that they own those places, and they administer the affairs in the best way possible. It would take too long to give an account, but I shall forward to you the reports as soon as I receive them. It is something which is worth while copying in large cities like New York, Philadelphia, Baltimore, and so on.

Then, also, we have an evil in New York about the public schools that I think encourages crime. There are not enough schools in New York City, especially on the east side. Of course the city authorities say that they can never provide for the children that come in every day on the steamships; but still it is a fact that many children have not had the advantages of a public school education because of it. They have their half-day school; that is, they divide and give them one session, but then the children are on the street during the rest of the time. And in speaking of the night schools, if the Government does provide night schools for people who want to study the 3 "Rs," why not have them open throughout the whole year? You take an immigrant who comes here in April, well, the ideas of Europe are fresh in his mind and he would very much like to study the English language, but he has no opportunity. He has to wait until the middle of October, when the public schools will open up, and meantime he becomes engulfed and drawn into the whirlpool of immigrant life, and forgets all his ideals and never goes to the night schools. We in the educational alliance try to meet this, but we are only a drop in the ocean. We can not provide schools for all of them—ours is only model work—we can not do work on such a large scale.

Another evil which we have in New York City, and which is no doubt in other large cities, is the tendency of forming petty societies. Although they may have benevolent purposes, still it gives cause for a great deal of trouble. It is very easy in a city like New York for 10 individuals to get together and form a corporation and get a charter and have their officers, and after that to do, in the name of the society, all kinds of mischief. In other words, the giving of charters to societies should be looked into. I was in one tenement house—I think it is No. 72 Essex street. I found 14 dancing schools in that one tenement house. These very same dancing schools are used as a meeting place for lodges every night in the week. On Saturday they have their religious services. The people of the same country will get a charter and they will form a little congregation—getting a charter, that is very easy—and have their own officers. In other words, in the same place they worship and they dance and they meet and wrangle; and all this in one tenement house. I think if the board of health were to look into that matter, they could easily stop such an evil.

Q. (By Mr. LITCHMAN.) That is in reference more to the immorality than to the industrial feature?—A. I am dealing more with the moral and educational problems; of course indirectly, those that may effect the economic.

One point which I want to call attention to: As I say, I am not a student of economics and I would not venture to make definite suggestions, when you discuss the question of immigration—whether something should not have been done. And I should not like to have this made public. This might be a little radical—periodical immigration. Here we take a census once in 10 years; we know then how we stand. We should then say that the ports are open for 2 years; after that we close them, and meanwhile give a chance to those people to become absorbed; and then after a few years open them up again. I know the owners of steamship companies and others might object to it; but I simply want to call your attention to the possibility of such a plan.

Q. (By Mr. FARQUHAR.) How are you going to manage such an arrangement in the face of our treaties with other nations?—A. As I say, I can not answer that, I simply throw it out as a suggestion.

As to the question of morality, I have just one more suggestion, and that is that unless they can have separate rooms boarders should not be allowed to be taken into tenement houses. I visited a house on Attorney street, in New York, where in 2 rooms there were 3 couples living, and 2 grown up girls—boarders. In other words, 2 rooms occupied by 8 people. The 2 girls ought not, in my opinion, to have been allowed to live in such a place.

(Testimony closed.)

WASHINGTON, D. C., November 13, 1900

TESTIMONY OF MR. JOHN GRAHAM BROOKS,

President National Consumers' League.

The commission met at 10.50 a. m., Vice-Chairman Phillips presiding. At 2.15 p. m. Mr. John Graham Brooks appeared as a witness, and, being first duly sworn, testified as follows:

Q. (By Mr. CLARKE.) You will state your name, post-office address, and occupation.—A. John Graham Brooks, Cambridge, Mass. I am sort of a miscella-

neous lecturer on economics. I was connected with Harvard College as lecturer 2 years, and for several years with the extension department of Chicago University. The most of my work is making special investigations and lecturing upon social and economic subjects.

Q. Are you president of the National Consumers' League?—A. Yes.

Q. Does that league undertake investigations in economic science?—A. Partly; but chiefly it is trying to organize public opinion against the sweat shop.

Q. Have you recently made any investigations of the sweating system?—A. Yes; we have been for 8 years making investigations.

Q. Please proceed in your own way to state to the commission some of your observations and conclusions on that subject.—A. We have found as to the history of sweating that it is bound up with new difficulties. England, for instance, had several investigations—House of Lords committees—and the history covers a period of practically 40 years and has been filled with very baffling difficulties. After the Massachusetts law, under Governor Russell, got fairly to work, probably in 1893, it was the first real result in this country. That has had a good result. The Massachusetts law is now working, I think, as fairly well as any law of this character can be expected to work, but, as the law has worked in Massachusetts, it has tended to drive the work into New York City until, roughly, \$126,000,000 worth is done in New York and probably not more than \$23,000,000 in Massachusetts. The law in Massachusetts, I believe, by general consent, works fairly well in preventing the abuses of the sweating system, but in New York and surroundings on Long Island and New Jersey are the same old abuses.

In New York City and its suburbs the rush of sweated industries is carried on more and more. It is impossible now to get them brought under any proper inspection. The work is sent to the homes, and while the law reads that every place shall be shown on the records, it is impossible for us to make public the places to which tons of garment sare sent every week in New York City, and also impossible to get any kind of adequate inspection, and of course under the present modern process of distribution these goods are spread all over the United States, so that no community is free from the evils.

The Massachusetts law, efficient as it has been in Massachusetts, has resulted only in changing the distribution point—to New York City largely—and not in checking the evil of sweating in irresponsible homes.

The evils are, first, that the employer can throw the rent on the private home, where it ought not to be. He escapes responsibility for practically everything except the cutting. The cutting is usually done in the shops, and the making up in the thousands of private homes. The associated charities finds that in an enormous number of cases there is a wage that is not a proper measure of earning power. You will find in hundreds of cases these poor creatures helped out with charity, and then in the boom season you find them all rushed in these private homes at a wage that, when you consider all the circumstances as to duration, etc., must be pieced out with charity. That makes the deadliest competition with the next higher class of independent labor that is conceivable. I believe that to be one of the very greatest evils of the sweating system. I do not know of any person who has honestly examined it that does not consider that it is one of the worst influences in this country in stunting the life of the family.

Of course the mere fact that the sweat shop is uninspected adds to the jerky condition of the trade. It is a very seasonal business, with all the evils attendant upon chronic idleness alternating with excessive work. The law can be broken at every conceivable point because there can not be adequate inspection. The work goes on to the limits of physical endurance, and we have more testimony than we know what to do with, to the effect that these creatures are working 14 and 15 hours a day during this boom season. That can not go on in the modern city without evils that society should guard against.

No first practical step for the help of this class, and for society in general, is possible except by some remedy that makes possible the kind of inspection that we now have in Boston.

One word about the present actual difficulty in New York—the sweating industries tend to center in and about New York. The growth is relatively more rapid in relation to the other parts of the country. There is some power there great enough to prevent a proper inspection, and politics get into it, and on the whole simply spoils the inspection.

Now, while it is the law that properly authorized persons have the right to know the houses to which the contractor sends goods of this sort, we have found it impossible by any possible device that we could control to get at these names. Legally, they should be given up to responsible parties, and we know the reason to be the reason that came out before the House committee in 1892. Then, as

now, the employer denies that there are any abuses. I am not bringing any charges of conscious dishonesty against him. But the employers and their attorneys said at that time: There are no abuses connected with our manufacture of garments. Then later you had the commission in Massachusetts, and Mr. Rufus Wade used very strong language—he is chief of the district police in Boston—before the commission, and holds the same view about it to-day. He testified to the “pitiful results” found in Boston before the law began to be effective in 1894. New York is now filled with these uncorrected abuses on a scale that Boston never knew.

Now, unless there is some influence brought to bear on public opinion that is strong enough, which we hope this commission will exercise, to make it possible for us to get at the lists of private homes, the uninspected places to which garments are sent every day, I think this chief tragedy in our modern industrial life will go on interminably. That is the briefest statement I can give of it.

Q. Do the various charitable organizations helping these people encourage the sweating system?—A. Without the slightest question. Of course, that is unconsciously.

Q. The commission will be very happy to hear you go into the social and moral aspects of this question, if you would like to do it.—A. People ask us, What are the abuses? I have mentioned, for instance, the fact that the employer can throw off the rent. That seems very insignificant, and rent, of course, in the early days and under simple conditions, was practically of no importance whatever; but our modern city has made rent an immense issue, so great that you will have classes of workmen that are paying a fifth of their income for rent, where they have to live in large cities. It has made that question of rent of very vital importance, and the employer by avoiding the building of large factories can throw that rent charge on the private home and thus escape that responsibility that has increased just in proportion as the modern system of industry has increased.

Then in the factory, power, steam or electric, is used to run the machinery, and that has set a pace of production against which the woman or child in the private home has to compete with foot power. The testimony of physicians that have examined them is that, given a sweat shop that is uninspected, where the members work in the boom season up to the limits of endurance, using foot power for the machine, that it is rare to find, after 4 or 5 years, any healthful person there. Of course the bearing of that on the woman as child bearer needs no comment before this commission.

Q. If the manufacturers were required by law to do all their work in a sanitary shop: that is, to thoroughly adopt the factory system, would it in your judgment practically cure the sweat-shop evil?—A. Assuming the law was enforced, yes.

Q. Would many of the people now engaged in that industry probably then reside outside of the cities, availing themselves of rapid transit to and from the shops, whereas now they feel compelled to live in close quarters in the city so as to be near the source of supply or their goods?—A. Certainly; for many of them this would be the case.

Q. Are different nationalities engaged in these sweated industries?—A. Yes; a dozen of them. It has to a very considerable extent driven out American women in Boston. Last week I was told by Mr. Griffin, an inspector in Massachusetts, that continually American women were giving it up because they could not make enough pin money even.

The women now in Massachusetts can not get that privilege without going to the inspector's office to get a permit, and an inspector is sent to make examination. If the home meets the sanitary conditions they may allow them to do work under that constant inspectorship. There are probably now perhaps 1,400 of these places existing where work is done for the contractor.

Q. Do you think if the factory system were to be substituted and sweating practically ended the cost of garments to the consumers would be more than now?—A. I do not, if the best machinery were put to use. Sweating puts a check upon the best modern methods of production. The sweat shop keeps foot power in the field at a time when steam and electricity should wholly remove this added burden from tired women. The possibilities of machinery are far greater in turning out the product than is sweated labor. I have had given me by manufacturers the testimony that they would willingly give up the sweating system if there was any sort of uniformity—any way to force other people to do it—because they could, by introducing up-to-date machinery, make a better product, and in the long run a cheaper one.

Q. Are not all the garments cut before they are sent to the homes of the sweat-shop workers?—A. Yes, the cutting; but there is very expensive and fine sewing machinery that can not be introduced into the home, and must be run by power that leaves the worker with some surplus of energy.

Q. What do you think would be the income of these same workers if they were in a well-regulated sanitary shop instead of in their homes?—A. I think a definite answer to that would be impossible; but all the evidence indicates that the wage would be considerably higher and the average work would be steadier throughout the year. Every evil of irregularity of work is intensified by the sweat shop.

Q. And they would work a shorter day?—A. Of course, they would work a much shorter day.

Q. What do you think would be the effect on the character of the garments produced?—A. There is not the slightest question that the character of the garments would be improved.

I have not touched upon the danger of contagion. Now, even in Massachusetts, where the law is better enforced probably than it has ever been elsewhere in this country, they are constantly obliged to withdraw the licenses because there is actual disease or too much filth. Now, if this is the case with the 1,400 inspected sweat shops in Massachusetts, what must be the possibilities of disease in the thousands and thousands of uninspected homes in and about New York City?

Q. Does your information lead you to believe that the better class of garments could be sold at present prices and the makers of these garments under sanitary factory conditions would find their condition greatly improved?—A. On the assumption that the highest developed machinery is introduced and used.

Q. Is not that almost inevitable in the factory system?—A. I think so.

Q. Competition will bring that about?—A. With the highest intelligence we aim to have the best machinery there is. As things now are, the contractor may profit in using this irresponsible and uninspected labor in the boom season. Of course, if he did not get it he would not do it. But his advantage is at a terrible cost to society, and he could not continue to profit by sweating, in my opinion, if he were to have the full benefits of the modern factory.

Q. (By Mr. C. J. HARRIS.) You say there is an advantage to the contractor in using the sweat shop because it is cheaper?—A. Under actual conditions as they are now, because sweating hinders mechanical improvements.

Q. In other words, they make goods cheaper in the sweat shops than in the factories at present?—A. A host of petty contractors without capital may now doubtless be used, in specific cases, to squeeze out a cheaper product; but even this in the long run would be impossible, I think, with a properly developed factory system.

Q. If they had such machinery that they could make them cheaper in the factory than in the sweat shops—prices generally regulate that sort of matter, and they would all be made in the factory?—A. I think so.

Q. Is not the class of goods manufactured in these sweat shops of the cheapest kind?—A. As a general rule, though some very expensive goods are made—even dress suits, and there are certain kinds of cloaks that are thought to be very excellent—are high priced at any rate. There is a good deal of high-priced garment making in the sweat shops.

Q. Now, you have spoken of the number of hours per day worked in the sweat shop. Is that an accurate statement of the number of hours worked, or is it like the case of the farmer's wife who gets up at sunrise in the morning and is busy about the house, you may say, until 9 o'clock at night? Do they sit down and work as they would in a factory for 14 and 15 hours a day, or do they take it up at odd intervals, working 15 hours a day?—A. In the busy season in the sweat shops they work very steadily, and often more steadily than in the factory.

Q. They, of course, keep their own time, as to the amount of hours they work. Has anyone made an accurate scientific observation as to the number of hours they work?—A. Quite adequate observations have been made as to the hours of work. If a given family, for instance, have a certain amount of work, and they know the season is only to last for a short time, they are all very anxious for the work and they will drive as hard as they can to get the most of this work.

Q. The fact that you find people working at 11 o'clock at night would not necessarily prove that they were working at 11 o'clock in the morning?—A. Of course not.

Q. Working on piece work they generally work more irregularly and take leisure at any hour they please?—A. The work is very continuous, protracted, and exhausting. The testimony upon this point is uniform and overwhelming.

Q. (By Mr. PHILLIPS.) Could not the hours be ascertained by the number of pieces they turned out?—A. I never have heard that testimony questioned about the length of hours work in the sweat shop. I should say very confidently that the kind of testimony that we have from the contractors and the people themselves and from the inspectors is such as you yourselves would accept as good testimony.

Q. (By Mr. FARQUHAR.) Does not the small wage earned in the sweat shop drive all the workers to longer hours in order to live?—A. Of course.

Q. (By Mr. CLARKE.) Manufacturers of clothing are generally accounted a very shrewd and enterprising people, are they not?—A. Very.

Q. Why do they not see it to be for their interest to employ the factory system instead of the sweat shop?—A. I think that any industry that has been a sweated industry, for instance, like the English boot industry, drags along for a long time even before the most intelligent men find it out. The most intelligent of them are now using the factory system about as far as they can. This surplus labor coming in gives the small contractor with little capital a chance to exploit it. If one assumes that all were perfectly intelligent, I have no question they would introduce the factory system, but it would have to come, after all, but slowly. It is for the real interest of thousands of backward farmers to adopt modern methods, but they cling to the old customs to their own loss and to the common loss. There are comparable abuses in the clothing trade. We can not safely assume the highest enlightenment in this business.

Q. (By Mr. FARQUHAR.) You speak of the boom or rush season in manufacture. How many months does that occur in a year?—A. Well, it varies, so that I would not dare to make the answer. It varies as much as the demand for anthracite coal does.

Q. Would it cover 6 months?—A. Yes.

Q. Then, with respect to the establishment of a factory, independent of this incidental hiring of labor, is it not a fact that the manufacturers of clothing in this country can not carry a factory 12 months in a year—it is too expensive; that they are not able to keep the manufactory going 12 months?—A. That would be a difficulty.

Q. Is not that the greatest difficulty that stands in the way of manufacturers even in New York City now?—A. That is a difficulty, but the factory system would greatly steady the whole industry.

Q. When you come to the seasonable trade, which is usually twice in the year, as we understand it, that trade is rushed for 2 or 3 months, all hands?—A. Yes.

Q. If these factories diversified the work so as to take up contract lines for other retailers or wholesalers, a class of goods manufactured for other countries for different seasons, so that they might be permanent in the manufacture, would not that be the practical way to reach your big factories and crush out sweat shops?—A. It might help.

Q. Provided, for instance, that foreign trade would enter into it just as well as domestic consumption?—A. Yes.

Q. In other words, would it not stand very much in the character of the department store, which has such a variety of goods in it that it requires the same force the whole 12 months through?—A. Yes.

Q. (By Mr. LITCHMAN.) How far is the sweat shop availed of by employers of limited means, who would not have the capital necessary to establish a factory with the improved machinery to which you refer?—A. That is the class that very largely use them. Some big factories use them only so far as some special emergency is concerned. There are some large manufacturers who do not use the sweat shop. Others use them only when the busy season is on.

Q. Now, if you can give us any information that emphasizes that point, I feel the commission would like to receive it—that the sweat shop is fostered and encouraged by these men, thereby not only degrading the conditions and wages of living, but also creating an unfair and unjust competition with those who are disposed to do legitimate business. Is that not a fact?—A. I should say, generally, it was the fact.

Q. Now, you spoke in relation to the nationality. Would you object to naming the prevailing nationality, if there is one, employed in this sweating business?—A. On the whole a variety of Hebrews probably are in it more than any other; also many Italians and some Swedes.

Q. Two-thirds?—A. I have never seen any statistics that are exact.

Q. (By Mr. CLARKE.) These same people were in it in the old country, were they not?—A. A great many of them.

Q. (By Mr. LITCHMAN.) How far do you think this matter could be reached by lessening the places where clothing is made?—A. That is the system in Massachusetts, and it has worked admirably there, but it has driven a great deal of the work to New York City.

Q. You think it is impossible to follow the goods in New York State?—A. It is done to such an enormous extent, and because the exact information that we want now and ought to get under the law is refused to us, because the great employers and manufacturers do not like to have the public know about it. They fear popularized information about the sweat shop.

Q. Is there sufficient legislation?—A. No; in my opinion there is not, and it would be better for me to say in reply to what Colonel Clarke has said, I do not imagine it possible to raise the question just now of forcing all this into factories. Without the slightest question it would be a great deal better if it could be done, but that is not yet possible. Certain practical steps ought to be taken first, like that already done in Massachusetts.

Q. How far would you suggest legislation, from the result of your experience?—A. I believe if we had this moment in Boston—I would like to drop the word "license," because it is not popular, and take the word "certificate" or "permit"—if, in addition to the permit that now every private house must have to do work in the open market, every one who manufactures clothing had to have a certificate that would bring him under inspection we should have about all that it seems to me possible to do, and that is exactly what we hope to bring about. If, however, we could secure in and about New York exactly what we have in Massachusetts it would be a great triumph.

Q. Have you had any experience, or have there come under your knowledge, any cases where disease has been contracted or communicated by reason of goods made under unsanitary conditions?—A. A very great number of cases. There are constantly diseases spread through uninspected sweat shops. That is a fact that every competent inspector knows and would not shrink from admitting, and the extent of it is very much greater than the public knows of. They are constantly finding diphtheria and typhus in the sweat shops, even where inspected; to a far larger degree of course in those not inspected or poorly inspected.

Q. The reason I asked this question is that I have seen it stated that soldiers contracted measles by reason of clothing made in sweat shops in our late unpleasantness with Spain.—A. An enormous part of that clothing was made in the irresponsible places. It was found by tons in the sweat shops. Now, the English law is so far developed that not one single garment of a soldier goes into an irresponsible place where it could not be properly inspected. Of course no one can have at his fingers' end the details of disease, but by an inspection of the health report it would be perfectly easy to get information, I think, or record of the diseases that are found in the sweat shops. Where there is an inspection, that is easily accessible. There is a great deal of such evidence.

Q. (By Mr. LITCHMAN.) Does the law of Massachusetts permit the destruction of clothing found in places where there is disease?—A. That is my understanding of it.

Q. (By Mr. KENNEDY.) Without opposition?—A. I do not think so.

Q. (By Mr. C. J. HARRIS.) Would the abolishment of the sweat shops take away the means of livelihood of these people?—A. That is the most sensitive objection always raised, and I do not want to seem to deny that there might be cases of hardship if we were to act vigorously in doing away with the sweat shop; but the experience of such a man as Mr. Wade, of the district police of Massachusetts, who has a great deal of information, and Mr. Griffin, indicates that as they slowly drift into the factory conditions they get into better wage and better hours, and all profit by it. Now, I do not deny there may be left certain cases of helplessness in the home, those that are unfit to go into the factory. I believe those people would have to be taken care of in some other way, and there would be a small residuum, but it would be infinitely better even for them. This wage under the sweating system works in such a way that the competition presses this helpless class almost out of existence.

Q. (By Mr. LITCHMAN.) You say a certain proportion of these people are supported by charity in the cities?—A. There are thousands of them supported half by charity and half by this wage.

Q. Do you think that the residuum after the factory system was established would require any larger amount of charitable support?—A. Distinctly less, so far as general demands were concerned. Charity and sweating react upon each other, so that both suffer.

Q. Would there be less or no more hardship than is naturally the case in a transition from one form of production to another?—A. I think not.

Q. (By Mr. CLARKE.) Have you studied the recent transition in Germany from house industry to factory industry, in some of the districts of Crefeld, for instance?—A. I have been a great deal in Germany, and I have always been interested in it; but I have no details about that and I shrink from answering.

Q. Will you please state, in a general way, whether or not there has been a large change in recent years for the better in that respect?—A. I can state with some confidence that as you go slowly from the house industry into the factory conditions you get the same sort of improvement there as you get anywhere.

Q. Wherein does the sweat-shop law of New York differ from that of Massachusetts?—A. It is almost the same law. The famous tag provision is a dead

letter. The New York law is practically the same law, and is a good law, if there were power enough there to secure its enforcement. There is obviously a fear to have the public know how large a part of these goods are made in sweat shops, and it has been beyond our means to get an account of the actual places to which goods are sent, as we can in Massachusetts. If we could get that one provision, so that we could get at the sweat shops in New York, and know just where they are, it would be a very immense gain. That can not be got unless public opinion is very much stirred up on this question. That is our hope for recommendation from this commission.

Q. (By Mr. KENNEDY.) Could you say whether the sweat-shop clothing finds its way into first-class establishments, like Wanamaker's and others in New York City?—A. I can say, without the slightest fear of contradiction, that there is not a great department store in New York that has not tons of sweat-shop goods in it.

Q. (By Mr. C. J. HARRIS.) Do they ever have these goods made in the country districts?—A. The country-made garment, I do not believe, is a serious factor in this production.

Q. Is there any objection on your part to that line of work?—A. I think it would be better if it did not exist, but I should not care to take any steps against it, because it furnishes pin money for the girls in their idle time; but the exigencies of the modern market and transportation, the quickness with which business is done, is curing that evil.

Q. Is there any labor organization among the workers in the sweat shops?—A. Yes, the labor organization of Garment Workers. They are working against enormous difficulties against the sweat shops, and are using their label on goods that are not made in sweat shops, and if they were powerful enough to enforce their demands, they would help very greatly; but I do not believe that any of these gentlemen would themselves tell you that they had any complete power to control the situation.

Q. Would the remedy be in the sweat-shop workers combining so that they could demand better prices for their goods?—A. No. They are too weak and helpless a class to organize completely enough to control abuses.

Q. (By Mr. CLARKE.) Has there been a diminution of sweating in New York since the enactment of the present law?—A. My impression is that it has increased rather than decreased, but I should not want to state that as certain information.

Q. (By Mr. LITCHMAN.) That is due to the nonenforcement of the law?—A. Yes.

Q. (By Mr. C. J. HARRIS.) Did I understand you to say the output of sweat shops has decreased in Boston?—A. Oh, yes; very much.

Q. Have you any figures in regard to that?—A. I do not think that anyone would question for a moment that the sweating has been decreased in Boston by the enactment of this law.

Q. (By Mr. KENNEDY.) What do you know about the sweat shops as an adjunct to the high-grade, first-class tailoring establishments in the great cities?—A. A great many of the places where men go to get their clothing have goods made in the sweat shops. We have found them over and over again.

Q. (By Mr. PHILLIPS.) Then you would have no assurance, in ordering clothes at a first-class tailor shop on Fifth avenue, that they were not made in a sweat shop?—A. No. You may know the man so well that you would be practically sure, but in the average shop in the city you can not be sure that your garments are not made in a sweat shop.

Q. (By Mr. FARQUHAR.) Do some of them have the Garment Workers' label?—A. Yes; they have the label. The label in the garment trade has met with great difficulties. The trade-union label in the garment-making industry in Boston, for instance, could not cope with the situation. There was not strength enough, and great abuses were practiced under it. It is, however, slowly gaining strength in New York.

Q. It has been abused there?—A. Yes, and no honest labor-union man will deny that so far as Boston is concerned.

Q. (By Mr. CLARKE.) We received testimony in Chicago last spring to the effect that nearly all of the leading tailors—those who make suits which sell for \$75—business suits—have the work done outside, in the homes of the journeymen, and that they are generally sweat shops. Does your observation in Chicago confirm that?—A. Yes.

Q. (By Mr. FARQUHAR.) Is it altogether fair to call that class of labor sweat-shop labor? These exceptions that are being discussed now—do they really belong to what we would call sweat-shop labor?—A. If a contractor takes a pile of coats and vests from a good tailor shop and gets them down in a private house, to that extent, of course, it is sweat-shop work, or tenement work, which is often worse.

I have no question that the ideal, if it was worth while to waste any breath on it, would be simply to stop all home work; but I should be very sorry to make, or seem to make, any suggestion of that sort to this commission, because I do not consider it a practical matter for us to deal with. It is only a question of seeing how we can take the next practical step in order to cover this great area of uninspected clothing in and about New York City. That is about the only question practically before us. I should be delighted if we could get any Federal legislation and uniformity, or utilize the interstate-commerce act in such a way as to prevent this uninspected product from being shipped about in the States; but, as I assume this is practically impossible to do now, I am very anxious that we should stick to the kernel of the difficulty, which is in and about New York City, and see if public opinion can be used in such a way as to enforce the law there in a proper way.

We could check the greater immediate abuses of sweating without raising the great and very awkward question of attacking all home work. The Canadian Government finds that a portion of its own goods are made in sweat shops. It sends out a trained man to examine it, and he brings back exactly the same report that the English Government returned. The prime minister, Laurier, says, (Reading) "I do not want to see that system of white slavery (sweating) prevail in Canada. If we have a duty to perform it is that we should make an effort to stamp out that sweating system in our own country. The postmaster-general has taken the initiative in that respect, and, with the sanction of the government, he has decided that in every contract given by the post-office department there shall be a provision which shall make it impossible for that contract to be farmed out," etc. In the United States public opinion is so little developed upon this point that vast quantities of Army clothing are reported from investigators to have gone straight to sweat shops. Is it less "white slavery" here than in Canada or England? The English Government, for instance, with its millions of pounds of products, allows no garment to be made unless it knows where it is made; that is, under decent supervision, without any irresponsible contractor that can not be traced. Now, if this commission could put that evidence in a simple form before the public and then state the simple conditions as they are in Massachusetts, and the tremendous difficulties that center in New York City, out of which probably 75 per cent of these goods are sent all over the United States, an important public service will be rendered.

Q. (By Mr. LITCHMAN.) Would you think it a wise action on the part of this commission to suggest that all goods for public use be compelled by law to be made in factories where proper inspection could be made?—A. I should hope that the commission would see its way clearly to a recommendation like that.

Q. Both State and national?—A. Yes, to see that goods made for our soldiers and civil servants should not be made where they are liable to drift into sweat shops, as they now do.

Q. (By Mr. PHILLIPS.) Would you have any amendment to submit to the New York law to make it more drastic?—A. I should want first in the New York law to have a list of sweat shops and all the places to which employers send garments through contractors, so that any responsible person can see them and the public know where they are made.

Q. (By Mr. LITCHMAN.) Have a registry made?—A. Certainly; they are attempting that now, but we can not get at them. There is a fear that the public will not like to know that so much is made in sweat shops. We only demand the elemental right of the buyer to know where and how the things he is to wear are made. All we want is that these facts shall simply be brought up in a very intelligent, cautious way, without any clamor or attempt to make startling statements.

Q. (By Mr. CLARKE.) Does the English law require the tag system of pricing goods?—A. It does not need that. Under its law every contractor has to give guarantees of a kind that make it altogether too risky for him to have his goods sent down to other than the Government shops or shops the standard of which is definitely set and known all about. The contract is very exact in that point.

Q. (By Mr. PHILLIPS.) But are they made in the houses or homes of the people?—A. No. They are made in properly regulated factories. You can see in London, for instance, some of the very finest factories, where they are working only 8 hours, with up-to-date machinery and good light, in contrast with the awful condition that exists in thousands of homes in New York City, and will to the end of time unless we force some provision that shall insure proper inspection. We ask only a guaranteed and adequate inspection.

¹ In a speech at Toronto, October 6, 1897. See Toronto Globe, October 7, 1897, for the whole address.

Q. (By Mr. FARQUHAR.) Does sweating still prevail in London?—A. There is a lot of sweating in private concerns, because this is so far only a Government arrangement.

Q. (By Mr. CLARKE.) In studying this question, have you had occasion to observe whether some of the largest clothiers in the cities have their clothing made in sanitary shops and are yet able to sell their goods in competition with the sweat-shop clothing?—A. That is done on almost every type of garment. I have a collection in my own house of garments that I have picked up, and almost every type of garment selling on the market can be made under splendid conditions at a price not higher than sweated goods are made. Some of the very cheapest things on the market are made in beautiful factories, showing again the possibility of doing this thing without the consumer suffering.

Q. (By Mr. C. J. HARRIS.) If a family lives in a cleanly manner, is there anything in the home work itself which makes it more injurious than factory work?—A. If you mean by that turning the home into a workshop, working for the great outside market, I think it is attended with evils that are too grave to be allowed.

Q. (By Mr. CLARKE.) You speak of the conditions now of city life, not so much of country life. You would not object, of course, if a farmer is also a shoemaker, who is doing a little shoemaking for his own family and his neighbors in his own house?—A. Certainly not.

Q. You see no great evil in that unless a man might overwork?—A. No.

Q. But you make a great distinction between that kind of desultory work, which is very exceptional, and the great manufacturing industry carried on in sweat shops in cities, which is a regular business?—A. Yes; I think that is a very important thing to say, because, of course, as about every question there is a line of casuistry where you can bring in a lot of cases that are very perplexing; but we are dealing with the exploitation of human weakness in great city homes, where there is a surplus of labor, and there are beyond all question enormous abuses, and we want to deal with such cases and not have our attention averted to conditions that are not altogether bad.

Q. (By Mr. LITCHMAN.) If this labor were transferred from the home into the factory, is it not true that the State laws of most of the States, at least, would provide for factory inspection, sanitary conditions, and other means of that sort, that would make the condition of the labor far better than it now is in the sweat shops where it is now employed?—A. Certainly; that is one reason why we want it.

Q. It is largely female labor, I take it?—A. Of course: the overwhelming majority is, with a great many men among them.

Q. It would be better for the female if the place of doing the labor were transferred to the factory for that reason, the improvement of sanitary conditions of employment, shorter hours of labor, State inspection, and other improvements?—A. Certainly; when the business is not inspected, or half inspected, a constant series of abuses is practiced, of which the following is an example: A man advertises for workers to learn some special work. He gets several days' service for nothing, or oftener for a wage on which no human being can live. Then excuses are trumped up that the sewing is not up to the mark, or he can afford only part payment. In this way, though he constantly loses his women, he is enabled to cheat a succession of victims. This is one type of fraud which the sweating system makes possible. It is not possible under factory work, or in any such degree where there is proper inspection, as in Massachusetts.

Q. (By Mr. CLARKE.) Since the elaborate investigations of this subject by some of the States and by Congress a few years ago, do you think that any new conditions have arisen in the practice which should be investigated at the present time?—A. Yes. I am glad that question is asked. The conditions have so changed, throwing the business into New York, that there is an entirely new situation there that we want information about and that the public should be informed about. New York City has not been covered, in my opinion, by any adequate investigation; and while a certain amount of work would have to be done, especially in Chicago, to a certain extent in Philadelphia, and some of the smaller cities, the chief work has to be done in the great distributive center now, where \$132,000,000 worth of work is done. All those facts we should put out before the public and then have such a recommendation as this commission should see fit to make.

Q. If the Industrial Commission were to enter upon an investigation of that kind, would you suggest that somebody expert in investigating the subject already should be employed to find out as much as possible, and that we supplement that by taking evidence from those engaged in the business, employers as well as employed?—A. Yes; but I do not believe a great deal of additional testimony is necessary.

Q. (By Mr. PHILLIPS.) Can you describe a little more fully the special conditions that exist there now that did not exist when these other investigations were made?—A. It is only in the enormous amount of work that is drifting into the homes of thousands that are not and can not be properly inspected. That is the gist of it all. The public is deliberately excluded from knowing about the sweat-shop product.

Q. Could they not be properly inspected if there were more inspectors, if the law were rigid in requiring it?—A. There is no public opinion now that enables you to get those inspectors. A very considerable change in public opinion is necessary, in the first place, to get competent inspectors, men that are not there for political reasons.

Q. They have two inspectors in the city of Boston, have they not?—A. Yes.

Q. And how many are there in the city of New York?—A. I believe in New York State there are 50.

Q. How many are there in the State of Massachusetts?—A. I am uncertain about the number.

Q. (By Mr. FARQUHAR.) Do you think there is a certain powerful class in New York there that would make an effort to prevent a more rigid enforcement of the New York law?—A. I am afraid there is a great interest there that now prevents the proper application of the law. I do not know that that is a gracious thing or a wise thing to say; if it is not, I should like to have it left out. But that is not doubted by anybody that has anything to do with it.

Q. (By Mr. PHILLIPS.) Would you be willing to describe somewhat more fully the sanitary conditions under which these goods are made in many sweat shops?—A. In the report of the House committee, 1893, several men engaged in the clothing business testified confidently that there were no abuses in the manufacture of clothing. They made light of the criticism that disease was spread through the sweat shop. If this commission sees fit to order an investigation that shall be competent and thorough it will find very terrible abuses that are not exceptional, but widespread. It will find that the sweat shop is the direct source of disease that spreads like a contagion through the community. There is such proof of this that I give this testimony with no fear of its contradiction. This is the reason why the public has a just claim to know where such articles as clothing are made. With the dangers and cruelties which attend so much of the sweat-shop product, it seems something like impudence to deny the right of the buyer to seek protection against these evils. As the law is now administered in and about New York the buyer and user have no such assurance. If there are no abuses and no dangers, surely no one should object to investigation. We simply stand on the principle that we have a right and our families have a right and the consumer has a right to know about these conditions; and we ask nothing except adequate guaranties that shall let us know that the goods are made right. No person can hear that proposition and deny that it is a fair one.

Q. Would there be any way of avoiding this by label or tagging?—A. A movement was started 10 years ago on the part of a common buyer. Women in different cities said, "We should like to know whether our goods are made in the sweat shops or not;" and when they found, for instance, with a great department store that had for sale 12 or 13 kinds of garments, that it was impossible to tell whether they were made in sweat shops or not, then a demand grew more and more that there should be some organization to find out where these goods were made. That led to the formation of the Consumers' League, which started in a very simple form first in New York. There are now 23 of these leagues, and it has taken national form, and we are trying to make careful investigations to see, for instance, that all kinds of garments are made under such conditions as we should all want our garments made. Then if any factory which is making all its goods under good conditions will take what is called the consumers' label, we give it. Then we ask at the retail store that they put some of these garments onto the counter where our members can go to buy. That beginning has been made, and it is organized with the purpose chiefly of creating public opinion about the facts. The league must be supplemented eventually by adequate laws. That movement is now growing, and it excites, of course, a great deal of hostility because it assumes that the great store must let it be known where its garments are made.

Mr. PHILLIPS. We would be glad, if you have finished this question, for you to give us any other information on industrial or labor lines that might or would be beneficial to the commission.

Mr. CLARKE. We recognize that a gentleman of his broad learning on economic subjects would be able to talk to us indefinitely and enlighten us on almost all subjects, but we should have to ask him to choose that which is most immediately in need of being exploited, and tell us what he thinks about it.

THE WITNESS. I should consider it a great privilege, gentlemen, if I could say a word about one subject that I hope the commission will have an authoritative word to speak about.

I believe the question of arbitration, the kind of arbitration that is going to be built up, not by State boards, but within the trade, needs investigation and restatement. It is one of the great subjects like sweating. Another is employers' liability where, I believe, as with sweating, the greatest abuses are going on in this country. If I wanted to select one thing upon which the commission could act with absolute security it would be in getting evidence and making recommendations along the line of a simple, decent employers' liability act for this country. Everyone knows the extraordinary confusion of our liability acts in the different States, the condition of the fellow-servant clause, contributory negligence, and the abuses of contracting out. Responsibility now is so ill-defined that the wise laborer in many States is absolutely afraid to assert his rights under the statute. The employers, on the other side, are plagued by irresponsible suits and an amount of litigation that is astounding the moment you compare it with any other country that has a national employers' liability act.

If there is anything that has been proved in the development of social legislation it is that there is no adequate dealing with the victims of modern industry that does not definitely throw the expense of accidents upon the industry itself, precisely as with insurance against fires. This is no longer a theory. Several countries are acting upon it. You gentlemen are familiar with the discussion that led to the recent compensation act in England that covered all this ground. You have, for instance, the accidents in the coal industry out and out, and there you eliminate all this petty snarling that goes on; that drops from 10 to 2 the moment you get this thing systematized; where you have it as well organized as is the accident insurance in Germany and one or two other countries. Now, it seems to me that that is so clear, the evidence can be stated in such a way by the commission that while you will not get practical men to consider that at once, the idea to which we have got to work being accepted by all those governments, reducing litigation and reducing the expense enormously—that that case is so clear that this commission is perfectly justified in stating the facts about that, and then discussing the question, the Massachusetts law and the Ohio law and the laws of some of the other States that are extremely advanced in regard to contracting out, the question of the fellow-servant act, and all the abuses.

Q. (By Mr. LITCHMAN.) Do you refer to the negligence of the fellow-servant?—**A.** Yes. It seems to me that perfectly practical recommendations are now easily possible by this commission, and would push the matter on to a further and final hearing without delay on all industrial accidents. Now, the history is perfectly clear and simple. I had to trace that for one report for the Government in 1891, 1892, and 1893, and the discussion always begins just as it has with us. It begins by assuming that the person, the individual laborer, is responsible. He assumes the risk of the business. That goes on until the modern complications of business show it to be atrociously unfair to throw the responsibility on a separate individual in a business like modern mining, for example. Then comes the discussion of trade responsibility under which the specific trade bears the expense. This is more and more the accepted principle toward which we must move in this country.

Q. (By Mr. PHILLIPS.) Will you describe the leading features of these laws that have been enacted by these five or six countries?—**A.** If you mean by that the definite provisions—

Q. Briefly state them.—**A.** The law began in Germany in 1884, in Austria in 1887, in Norway in 1894, since when it has extended to Finland, Great Britain, Denmark, Italy, France, and even Spain. The law is obligatory in five of these countries. The law has probably had its highest organization in Germany, where the employers must form an association based on collective responsibility. The burden of expense falls on this association of employers, on the theory that the expense can, in the long run, be added to the price of the product.

The new English law is voluntary, but the injured laborer has the first claim upon what is due his employer from the accident insurance company. This more rational method involves, of course, systematized insurance, in order to save the individual employer from sudden and unforeseen expenses which might ruin an ordinary employer. I can not do better than refer the commission to a thorough and admirable study of industrial accidents and employers' responsibility in the seventeenth report of the labor bureau of the State of New York, just published. No one can read that report, comparing the liability laws now existing in the United States, without seeing that our condition in respect to employers' liability is extremely crude and unsatisfactory.

Q. (By Mr. A. L. HARRIS.) Would you go to the length of the recent British legislation on the subject?—**A.** Yes; and I wish to say that I have never seen a

student that has thoroughly studied that who is not of the same view, so far as the principle is concerned.

Q. Do you believe that legislation of that sort would cripple the industries of this country?—A. No. That objection is always raised, but I think it can be said that in no other country can it be found to have crippled industry. Of course it begins with the difficulties that all new laws have to contend with.

Q. (By Mr. CLARKE.) Is one of the effects of these modern laws on that subject to diminish litigation?—A. Yes; that is one of the first results.

Q. Is it not a fact that in large cities especially certain lawyers have acquired great reputation as managers of personal damage cases?—A. That is true. In public service corporations under our laws the abuses against the companies are one of the chief nuisances. The condition of our laws is a premium on blackmail, so that employer and employed alike suffer.

Q. (By Mr. C. J. HARRIS.) Is it your experience that corporations throughout the country furnish physicians and medical attendance wherever accidents happen, and in certain accidents give pensions?—A. There is an enormous amount of it done, and especially in the largest corporations; they treat their men best here, upon the whole. I hold that the large corporation treats its men better than the little people do.

Q. I understood you to say in the anthracite region the employers—A. (Interrupting.) I said in the Lackawanna Valley. There is no organized employers' liability, I believe, in the mining of coal in that district.

Q. Do the companies do anything themselves?—A. They send them to the hospitals.

Q. Do they not furnish physicians and pay for the expense while in the hospitals?—A. Certainly.

Q. (By Mr. LITCHMAN.) Is not that expense paid by a reduction in the wages of the man?—A. It is the town hospital.

Q. (By Mr. KENNEDY.) Do you know of any case where corporations do these things, where they treat these injured persons up to the full measure of what should be done for them?—A. Several large corporations like Mr. Carnegie's do, but it is benevolence, while it should be put on a basis of right.

Q. (By Mr. PHILLIPS.) Is not a part of it taken from their wages, however?—A. I do not believe it is taken from their wages in any case known to me.

Q. (By Mr. CLARKE.) Doubtless there are cases of that kind in Massachusetts?—A. There are such.

Q. In those cases you think they recognize that men are better than the law, and you want to have the law made as good as the man?—A. Yes.

Q. (By Mr. LITCHMAN.) Is not your idea in the line of the legislation that has compelled the safety couplers on cars?—A. Precisely, and the power brake.

Q. So as to compel the railroads to believe that it is cheaper to have an air brake than to kill people?—A. So as to make it cheaper for the railroads to furnish safety appliances than to pay penalties.

I should be very glad to say one other thing about a different question, if the commission is willing to hear it, that I think is a very momentous matter in this country just now; and that is the relation of the new organization that we mis-call the "trust" to organized labor. I know it is a question open to dispute, and probably no two persons are agreed about it, but I have tried honestly for several years to get information about it, and I think that the new combinations are going to have a very powerful motive to get rid of trade unions, or to take the heart out of them, by making them sign a contract that they will not have anything to do with the application of new inventions within the trade—which, in my opinion, is the most ingenious way to weaken a trade union.

Q. Explain that a little further; I do not quite catch your idea.—A. If a trade union, for instance, in the iron industry or any other industry, has to sign a contract—as the building contractors in Chicago wanted the building trades council or the trade unions to sign a contract that they would not have anything to say about the use of machinery—to leave all questions of machinery wholly to the employer, the principle of unionism will be endangered. To say to a trade-union group that it shall not have anything to say about the conditions of applying new inventions is to strike a very terrible blow at that union. It strikes the greatest blow, in my opinion, to organized labor itself and is going to raise a great deal of difficulty. Most of the new combinations do not like the trade unions, chiefly for the reason that where machinery is very highly developed and plays a great part in production the unions naturally wish to have some voice as to the manner in which the machinery should be used. The better unions do not oppose machinery. They know its advantages as well as the employer, but the manner in which machinery is used is of vital concern to the union. The new invention often alters the wage scale and often drops out a few

men in a given group. The union wishes to discuss these new conditions, and that causes delay where there is a highly developed trade union. That is said to me by three of the strongest business men that I know in this country as the ground of their opposition to unions. I know perfectly well that those men would not publish that, but they know that they get an economic advantage over the English by being able to apply machinery just as fast as it is invented, without any reference to a trade-union committee. As these combinations develop they are going to try to get (as they ought to do) all the advantages of inventions and apply this machinery with the utmost rapidity and with the least possible friction from the trade-union committees. Now, that question is not a question of theory. I have been told by men who are supposed publicly to stand for trade unionism and think it very important that they mean to get rid of the trade unions if they can, because they are an economic hindrance to the largest possible and most rapid multiplication of the product. I believe in the trust just as I believe in the trade union. If capital gets an economic advantage out of organization, of course labor gets an economic advantage. That is too fundamental to discuss. The conditions of competition make organization as essential to one as to the other.

Q. If one has a right to that advantage, the other has?—A. And public opinion will recognize this common right. But the use of machinery is going to make a very great difficulty in this country.

I believe it to be true that the reason we have two socialist mayors has its roots in this question of machinery. The last machine, especially, and incidentally other machines, have been introduced so rapidly that the unions feel helpless to secure their share of advantage in the new invention.

Now, by these influences in New England some of these unions have been half crippled, and the result has been simply this: Feeling the helplessness of the trade union, they have turned to the municipality; have become socialists. They have turned to the State, and this process will continue if machinery is used in such way as to break down unionism. If the machine beats them, there is no alternative except to make socialists at a rate much more rapidly than is commonly supposed.

Now, it seems to me if this commission would let it be known that it believes that trades unions have just as much right to organization as capital, that if a thing is good on the one side it is good on the other, and that labor ought to have advantages that employees claim, the result would be beneficial. It seems to me a perfectly conservative word can be spoken by this commission and a wise one, in warning employers to hesitate in the attempt to arrest or weaken the trades-union movement. They can not do it without making the men socialists. They ought to know that if they want to make socialists in this country, they have the means in their own hands. They have only to "smash the unions."

Q. Your idea is that it is the wise alternative for the employers of labor to encourage honestly and intelligently conducted trade unions?—A. It is one of the most conservative things they can do in the class of industries of which we are speaking.

Q. (By Mr. CLARKE.) Among the employers of labor in this country on a large scale has not the objection to unionism been waning in recent years?—A. Yes, among a certain class of employers, and it has been gaining among other employers that are to-day organizing against foreign competition. The proof of that is as absolute as anything can be. I have been told by as strong a man as there is in this country in the iron business, "I will throw all the dice on the issue that trades unions are smashed in my business. That is one way in which I will get the advantage over the English ironmaster. Just as long as he is subject to the union and we can delay the application in this country I have an economic advantage." The capital fact in this dislike of the union is "interference with the employers' business." In the great machine industry the immediate use of new inventions, without any stopping to consult union committees, is very vital from the employers' point of view. It is just as vital to the union that it share as much as possible in the advantages which the new machine brings with it. If a union can say nothing whatever about the way in which new machinery is introduced, the employer gets an advantage so great that, in many industries, he could cripple the labor organization outright. English ironmasters and engineers will tell you that the Carnegie Company competes against England far more effectively and dangerously because no union committee has a word to say on the question of new machinery in those works. If unionism is important at all, it must have the right to discuss the conditions under which new inventions are applied.

Q. Now, the most of the trades-union leaders who have testified before this commission have spoken of the union as a trust. You recognize it as in a sense a

trust, do you not?—A. I think that has to be very cautiously stated. If with the proper qualifications, yes; but without qualification it is misleading. The unions try to shut off all forms of competition that hurt them. They are so far a trust.

Q. It is a combination of one interest just the same as a consolidation of manufacturing companies is a combination of another interest. The employer and employee are organized to deal with each other?—A. I hold the trades union is a trust to this extent: It is striving to shut off all competition that interferes with its union, whether apprentices or anything else, and in that sense it is proper to call it a trust.

Q. What you say of a disposition on the part of some of the trust magnates to smash the unions is entirely—A. (Interrupting.) I do not want to generalize on that too much, but I will illustrate: A few days ago I went to a gentleman who has organized two of the most successful trusts in the United States. We had previously talked often about the trade union. I said, "Does it begin to get clear to you what you are going to do with the trades unions?" He said, "We do not care a snap of the finger for them; we do not fear them." He gave me evidence to show that if the trust is organized geographically, so that it has different concerns at work over a considerable geographical area, a strike may be checked at one point by supplying the market from other and distant plants. This has actually happened, and I have been told the details about the defeat of one strike in Massachusetts. He said, "We do not even fear the trades unions any longer." It is that kind of evidence that I think makes it clear that the trades unions are not going to have a very easy time with these combinations.

Q. (By Mr. KENNEDY.) Your idea is the introduction of labor-saving machinery is going to be employed by the trusts to smash labor organizations?—A. It gives them an enormous advantage if they control the machinery, as in the case given of the lasting machine.

Q. In the printing business, I would like to call your attention to the fact that, notwithstanding great revolution which has been brought about by competition and by the introduction of labor-saving machinery, the Typographical Union is stronger to-day than it ever was.—A. I know that, and there are special reasons to explain it.

Q. And the great improvement that has been brought about in the press room has made work for tens of thousands of people beyond what we would otherwise have had?—A. I do not mean that it would throw people out. I claim machinery sets more people to work than it throws out. I did not mean to raise that question; but I think the experience of the Typographical Union with machinery is distinctly an exceptional case so far as it relates to the point I am trying to make.

Q. If the other unions are as intelligent and as progressive as to accepting labor-saving machinery as the Typographical Union was, will the employers still be able to smash the union through these machines?—A. I think if you assume that the employee is more intelligent, and that at the same time the employer is more fair, the difficulty can be bridged over. It is a question of intelligence and fairness on both sides.

The president of one of the largest corporations in this country told me, "My greatest fight at the present time is with the introduction of machinery; but I am bound to be so fair as not to break up the union. I see they have a right to their unions." And yet he said it was the greatest difficulty in his business. He was rapidly putting in new machinery, and it changes things, changes the wage scale, etc.; but there was a man who would be perfectly fair, and every time he put in a new machine—a new invention—he called in the representatives of labor and talked it over with them. Of course the difficulty is removed when you assume that attitude of mind.

Q. (By Mr. LITCHMAN.) Can you tell us about the lasting machine you refer to, how general its use is?—A. I think it is practically decided now that it is a success, and it is spreading more and more, and has weakened one of the most powerful unions in New England.

Q. Is it a fact that it can be applied only to shoes no smaller than a miss's shoe?—A. That is not my understanding of it.

Q. You doubtless have observed that these advantages were introduced by the McKay machine, and all these other machines have been supplementary to that?—A. Yes; but that is the most important, the McKay and the Goodyear machines, and the laster.

Q. (By Mr. CLARKE.) You spoke of the introduction of improved machinery, especially in Massachusetts, as tending toward socialism. Is that because it throws some people out of employment, and they are uneasy and discontented and do not know where else to turn?—A. I want to restrict that. I say only where the new invention is applied in such a way as to make the trade union feel that it was losing its grip. Only to that extent does it tend to make the socialist and

increase the socialist vote in Haverhill, Brockton, and these towns. To that extent there is no question about the truth of it, in my opinion. I think there is nothing more dangerous than to convince trades unions that they have not the right or power or the advantage of organization.

Q. (By Mr. LITCHMAN.) Have you found this socialistic tendency in communities other than those that have a large French-Canadian element?—A. Brockton has 40,000 people. It has a plumber for mayor—a socialist—and there are very few French-Canadians.

Q. (By Mr. CLARKE.) What remedy can you suggest for this commission to recommend to Congress and the several State legislatures against this evil of too rapid revolution in industries, which becomes oppressive to the employees?—A. I think that is the hardest question that anybody can ask. In the first place, I do not think it can be checked, or that it ought to be checked. It has got to be taken for granted that the machinery is going to make its way. But I believe that there should be some forms of conciliation and arbitration in the trades interested, to which the question of new machinery should be submitted. We must work out a method by which the new invention can be applied in such a way as to do the least harm to the group working that industry. That, I believe, will have to be done, and some of the employers with large experience are agreed upon this. That should be based on some form of arbitration as applied to the specific case we are dealing with. No wise man asks for less machinery, or that machinery be run more slowly. It is a question of using it so that labor organizations suffer the least harm. This is now done in many businesses.

Q. Now, what would you advise as to compulsory arbitration, or do you think that it should be undertaken by law?—A. I am almost sorry that this is asked, but I am willing to say this about it. I think the New Zealand act, on the whole, works a great deal better than the most of us think it does; but I think the difficulty that Mr. Harris brought up this morning against Mr. McCormack is a very fundamental difficulty that has to be recognized—that is, forcing a man to carry on his business. And it has seemed to me very probable that for exceptional cases there will have to be worked out something like compulsory arbitration. I am not prepared to say what form that will take. It will have to be wholly exceptional and come only after the possibilities of conciliation and mediation have been carefully and elaborately tried, so that the responsibility shall be thrown on the employer of refusing this. Many practical men have begun to ask for compulsory arbitration. Two men in the anthracite region told me recently, "I wish to Heaven we had compulsory arbitration." I said, "What do you mean?" One said, "A great deal of trouble would be avoided if we had compulsory arbitration." I said, "Do you know the New Zealand law?" "Never heard of it." "Why do you want compulsory arbitration?" "I have had so much trouble in dealing with unions, and especially with unorganized men, that I had a great deal rather have a properly constituted court to come before after we have tried conciliation than to have a State board or a mob of labor men. The State board deals with little disputes, but the great disputes it can not do anything with." It is of interest to say that here are two men who know nothing about the history or the theory of it, speaking out of their own experience.

I believe some form of compulsory arbitration for specific cases that assumes the use of organized mediation beforehand—I believe that may come about in this country; but the ordinary reference from a little country of 790,000 people—hardly bigger than the city of Boston, in America—is inadequate.

Q. The fact remains nevertheless that the truth is given to babes and sucklings?—A. That is a very important thing to say, I think. It may be they have got the trick down there; I do not know nor will anyone know until a period of business depression.

(Testimony closed.)

WASHINGTON, D. C., November 15, 1900.

TESTIMONY OF MR. MARTIN FOX,

President Iron Molders' Union of North America.

The commission met at 10.45 a. m., Mr. A. L. Harris presiding. At 4.02 p. m. Mr. Martin Fox appeared as a witness, and, being first duly sworn, testified as follows:

Q. (By Mr. FARQUHAR.) You will please give your name, residence, and post-office address.—A. Martin Fox, 433 Walnut street, Cincinnati, Ohio.

Q. What is your present official position?—A. I am president of the Iron Molders' Union of North America.

- Q. How long have you been president of that body?—A. Since 1890.
 Q. How long have you been a member of the union?—A. Since September, 1884.
 Q. Has your union been a national body since 1890?—A. Since July, 1889.
 Q. Has it quite uniformly maintained its national existence since that time?—A. Yes.
 Q. Have you a statement to read before the commission?—A. I drew one up, because I could make my testimony more comprehensive and of more interest if I submitted it in that way.
 (The paper submitted by the witness was read, and is as follows:)

IRON MOLDERS' UNION OF NORTH AMERICA.

The Iron Molders' Union of North America was organized on July 5, 1859. It includes in its membership to-day about 65 per cent of the iron molders of the United States. Its initiation fee is \$5, each member paying 25 cents per week as dues. Forty per cent of the weekly dues goes to pay the running expenses of the national organization, officers' salaries, strike benefits (\$7 per week), and a graduated death or disability benefit of from \$100 to \$200, according to length of active membership.

It pays three benefits—the strike and death benefits previously mentioned and a sick benefit to the amount of \$5 per week for a period not exceeding 13 weeks in any one year.

It has no affiliation with allied trades except through the American Federation of Labor.

STRIKES.

The constitution of the Iron Molders' Union makes a very complete provision for careful investigation of all possible causes of strikes before one is undertaken. In corroboration of this statement I herewith submit a quotation from the law governing the preliminary procedure. The executive board referred to is composed of 7 members in different sections of the United States and Canada.

"When a difficulty occurs under the jurisdiction of any local union, through a reduction of wages or through the principles of the organization being jeopardized in any manner, or should any local union desire to make a demand for an increase of wages, the union under whose jurisdiction the trouble exists shall hold a meeting at once to consider the same. They shall take a secret ballot to determine whether to accept or reject such reduction in wages, or make a demand for an increase in wages, or whether the union shall or shall not insist upon the enforcement of said union principles. It shall take a three-fourths vote of all the members present to decide, no member being allowed to vote on said question who has not been a continuous member of said union for at least three months previous to the date of said meeting. If, in the judgment of the union, they shall decide to reject said reduction, or insist upon the enforcement of said union principles, or make a demand for an increase of wages (said demand being refused), the members involved shall remain at work, and the union shall cause to be issued and sent to the president a bill of grievance, stating the nature of the trouble and the action of the union thereon. The president, immediately upon receipt of said grievance, shall personally or by deputy, in conjunction with the local committee, proceed to the place of difficulty to investigate the cause of the trouble, and, if possible, effect a settlement, failing to adjust which he shall cause to be sent to each member of the executive board a copy of the grievance. Upon the receipt of the decision of the executive board the president shall immediately notify the union as to the result, and should the grievance receive or fail to receive their sanction, the union shall hold a meeting and be governed accordingly. After notice is given that the grievance is not sanctioned, should the union decide to strike, it may be considered sufficient provocation for suspension from the rights and privileges of the Iron Molders' Union of North America, at the option of the president and executive board."

It would be difficult to enumerate all the causes which lead to strikes, but chief among them are the question of wages and the discharge of men for belonging to a union. These are without doubt the most prolific causes in the foundry industry.

Sympathetic strikes are discouraged, because they are contrary to the principle embodied in the law governing strikes of the organization, which requires a thorough canvas of the situation before a strike is undertaken. This class of strikes are, as a rule, the result of the quick sympathies of workmen for one another when attacked by the employing interests. As they are creatures of impulse, however, they often result most disastrously to the workmen engaged. They

are undertaken without proper investigation, and should therefore, in my opinion, be discouraged. The employing interests are combining so generally in the form of associations, designed either for attack or defense in industrial warfare, that it may be necessary for the unions representing the mechanics of allied trades to combine, in order that they may be better able to resist these powerful and sometimes aggressive associations of employers. But in such an event strikes that might result in all the allied trades when one is attacked would not be of the sympathetic order, as they are now commonly known, but would be the result of the careful consideration and calm judgment of some tribunal representing the several trades, and competent to arrive at an intelligent decision upon the points involved. I give it as my opinion that the trend will be in that direction, just as it has been in many large centers among the building trades.

Asked as to the economic results of strikes, I say, without hesitation, that they are unprofitable alike to the community, to employers, and to workers, in the immediate analysis; but how can we compute what they have saved and are saving to workmen in wages and conditions? Without the ability and the will to offer organized resistance to what they deem unjust demands upon them there would be nothing between the workman and a condition even worse than slavery. In the last analysis, then, strikes may fairly be credited with having saved to the workers, both organized and unorganized, a more equitable share of the wealth they produce than would have been preserved to them had they passively submitted to whatever exactions were required of them.

The necessity, however, of resorting to this primitive method of securing a fair reward for labor is to be deplored, and I hold it to be a reflection upon the intelligence and civilization of the citizens of these United States that employers and employed have not discovered a means of adjusting their differences and dealing equitably one with the other more in keeping with the progressiveness that has characterized our actions in other directions.

CONCILIATION AND ARBITRATION.

In many trades the unprofitableness and unsatisfactory results of strikes have led their trades unions to establish wherever possible a system of voluntary conciliation and arbitration. Along this line might be mentioned the agreement that was ratified by the Stove Founders' National Defense Association, an association representing the controlling interests in the stove trade, and the Iron Molders' Union of North America, a trades union representing 75 per cent of the molders engaged in the stove manufacturing industry, in 1891.

The essential features of this agreement are that there shall be no cessation of work by reason of any dispute, that the parties immediately interested shall first make an effort to adjust their differences, that these failing the presidents of the two associations, or their representatives, shall make an effort to conciliate and adjust, and, as a last resort, should the dispute still remain unsettled, an arbitration or adjusting committee composed of three members of each association shall take the matter in hand and finally decide it. Only once during the past 10 years has it been necessary to take any dispute before the committee of last resort. Nor has there arisen any dispute or disagreement that has not been settled without recourse to a strike. There is no element of compulsion, it will be noticed, in this method of adjusting differences—it is the voluntary election of representative associations of the employing and employed interests in the stove-manufacturing industry.

One point to which I desire to draw your particular attention is that organization of both interests is a prerequisite to such an arrangement. The opposition of some employers, therefore, to recognition of an organization of their employees is ill-advised and illogical if they are favorable to the abolition of strikes and the arbitration of differences. It is, perhaps, unnecessary that I should point out to this commission that the ends of justice and equity can not be conserved when matters affecting wages and conditions of labor are left to the individual negotiation of employer and employee. During many years of severe conflict between the individual stove manufacturers and the iron molders' union these lessons were well learned by both sides. It was found, too, that where the union was strong the molders could exact better wages than they received where the union was weak; hence some manufacturers found themselves laboring under the handicap of a greater labor cost than their competitors. Thus in the fullness of time, and after many bitter experiences, the stove manufacturers formed what is now known as the Stove Founders' National Defense Association. The union had one severe conflict with the association in 1887, which left both sides pretty well sick of fighting and eventuated in the agreement previously referred to.

Besides providing for the adjustment of disputes as outlined, this instrument further requires uniformity of labor cost, as far as practicable, in each competitive district. Provision is also made for annual conferences between an equal number of representatives of each side, which take up the question of wages to be paid for the year following and such matters of shop practice and regulation as may be deemed expedient by either side.

In the matter of removing friction that arises from wage disputes, our experience with this arrangement with the stove manufacturers justifies me in saying it has proven an unqualified success, but it is only fair to add that the wise policy of the stove manufacturers themselves was a contributory cause to this. They learned, as it would be well for every employer of labor to learn, that the mere cutting of wages will give no relief from the evils of trade depression, but simply tends to intensify them, and therefore during the panic years from 1893 on no cut was made in the standard of stove molders' wages, and when the depression was raised and a more prosperous season was in store the conference held in the spring of 1899 increased wages 10 per cent, and again in the spring of 1900 increased them 5 per cent more. It is true the representatives of the molders asked for more on each occasion, but a feature of these conferences is mutual consideration of interests, and the advances named were the compromises finally accepted as agreeable to all parties.

There are several things which have contributed to the success of this method of adjusting disputes between members of the Stove Founders' National Defense Association and the Iron Molders' Union. Among them are that the interested parties are first required to make an earnest effort to settle their own differences; that is, the individual employer and a committee of his own employees; that when referred to outsiders the dispute goes into the hands of men who are thoroughly conversant with the technicalities of the trade, and competent by their own knowledge to come to an intelligent decision after hearing a statement of the facts; that this reference is the voluntary act of representative associations; and lastly, that each side has a wholesome respect for the other's power of resistance against injustice, and, to cement the whole, the two associations have acquired that confidence begotten of 10 years of fair dealing and success.

In the late nineties another association of foundrymen came into existence under the title of the National Founders' Association. This association admits to membership practically all foundry interests not identified with the Stove Founders' National Defense Association. Its membership, therefore, is a composite one, including machinery, jobbing, agricultural, malleable, and other foundry interests. It does not yet represent the majority part of these varied interests. As it was built on the lines of the Stove Founders' National Defense Association, and was designed to resist what might be deemed arbitrary demands on the part of labor organizations, advances were made by the representatives of the Molders' Union looking to the ratification of an agreement similar to that existing with the Stove Founders' National Defense Association. In March, 1899, the negotiations resulted in the adopting of an agreement in New York, and since known as the New York agreement, which pledged the members of each party to the agreement to continue operations pending the settlement of disputes between them that had reached the acute stage. Such a disagreement by the terms of this instrument was referred to the consideration of a committee composed of three representatives of each side. While during the year and a half of the life of this arrangement many disputes over wages were successfully adjusted, it has not on the whole worked as satisfactorily as the agreement with the Stove Founders' National Defense Association. And as a result of the inadequacy of the New York agreement to meet all emergencies, we have the strange spectacle of the two associations being engaged in a very serious conflict in the city of Cleveland to-day, while in other localities differences are being treated as required by the terms of the New York agreement.

The reasons for the partial failure of this attempt at voluntary arbitration between the National Founders' Association and the Iron Molders' Union are not difficult to determine. In the first place a great diversity of foundry interests were represented, and the National Founders' Association lacks that homogeneity which characterizes the Stove Founders' National Defense Association; second, a considerable number of the members of the National Founders' Association were opposed to the recognition of any labor organization; and third, the mistake was made on the part of many of the members of the National Founders' Association of declining to negotiate a settlement with committees of their men, and referring every dispute at once to the associations for adjustment.

From my experience with these two associations of foundrymen, I give it as my opinion that a voluntary system of conciliation and arbitration of industrial dis-

putes will be found satisfactory and adequate for all ordinary emergencies, and that such a system can only attain its greatest usefulness when the employers identified with the industry interested give the organization of their employees full and unreserved recognition.

I am emphatically opposed to any form of national compulsory arbitration. I believe it to be opposed to the spirit of our people and fraught with grave dangers to both factors of industry. Much has recently been heard of the compulsory arbitration law of New Zealand, and it may have been as successful as its admirers claim in these islands; but our people are not like the New Zealanders in manner of thought, our interests are more diversified, our country vastly more extensive, and there is much less community of feeling between the different classes of our people upon matters affecting the diverse interests of capital and labor than might reasonably be expected in a small community like New Zealand. Under a compulsory form of arbitration the finding would very likely prove unsatisfactory to one or other of the interested parties. If the workmen, how could compliance with the award be enforced? By a term in jail? Such procedure would be construed by many as a distinct violation of the provisions of the Constitution of the United States.

In my experience State boards of conciliation and arbitration are of little practical value. For obvious reasons, as generally constituted, they neither possess the full confidence of employers nor employees. Their members can not be conversant with all the diversified interests that may demand their attention, so that unless their labors are supplemented with the assistance of experts they are not always competent to give an intelligent decision. And finally their finding can be disregarded by either or both parties with impunity.

THE INJUNCTION IN STRIKES.

As a layman I can not go into the legal aspect of the injunction as it is known in strikes. The Iron Molders' Union, however, has had several experiences with them, and they have been so sweeping in their character that it justifies me in saying, in many instances, they infringe the liberties of the citizen and have given rise to the suspicion that the temporary injunction is applied for with the sole purpose of breaking the strike by tying the hands of the strikers completely. It is unfair that the final hearing should be set for a remote date from the granting of the temporary order.

Legitimately used, the injunction, as a prerogative of the courts, is a wise provision of our jurisprudence, but I am strongly of the belief that the use that has been made of it in labor troubles since 1894 is contrary to its original intent, subversive of the rights of the citizen, and has done much to create a feeling of disrespect and distrust toward the courts among a very considerable portion of the community, to the distinct injury of its morality and patriotism. It is therefore the part of wisdom that wise limitations be placed upon the use of the injunction, and, further, that in the cases of contempt arising from this form of injunction the defendant should be given a jury trial and in no case be summarily punished by the judge of whose court he was in contempt.

Trades unions do not countenance a violation of law in the prosecution of a strike, and if a striker violates any law, either against property or person, the law itself provides adequate punishment, and, it seems to me, that deterrent should suffice. But if the courts are to be permitted, by what appears to be an illegitimate use of one of their prerogatives, to effectively destroy the efforts of workmen in preserving the standard of life or in elevating it, then, indeed, will the interests of the worker be in deadly danger.

LABOR-SAVING MACHINERY IN THE FOUNDRY.

In speaking of labor-saving machinery in the foundry I do not refer to the improved facilities in the shape of power cranes, cupolas, etc., but to that machinery designed to substitute the hard work of the mechanic. This form of machinery is commonly referred to as molding machines. Until within the last 10 or possibly 5 years labor-saving machinery was not a serious factor in the foundry, but of late years the molding machine has undergone a wonderful development and is rapidly becoming a factor to be seriously reckoned with.

The attitude of the Iron Molders' Union is not hostile to the machine, but on the other hand it has advised its members to promote its development, and whenever given the opportunity to operate one, to bring out its best possibilities. The foundrymen, however, seem to prefer the policy of teaching unskilled laborers to operate these machines instead of employing molders. The only apparent reason

for this is that the unskilled laborer, being accustomed to work for less wages than the mechanic, will operate the machine for less. That this is a profitable policy is open to serious doubt. I hold the opinion that the mechanic will make the most profitable operator, and this no doubt will be a subject of future negotiation between the associations of foundrymen and molders.

The machine has so recently become a productive factor in the foundry that its effect can not yet be accurately gaged. I can not say, for example, how many molders have been displaced by it, for almost concurrent with its introduction we have experienced a remarkable expansion of the iron manufacturing industries of the country, which during the year 1899 overtaxed the capacity of the foundries. At the present time there is a marked reaction, and although there are many idle molders it is impossible to compute how many of these are idle because of the machine or how many are idle because of the depression of the industry.

PRISON LABOR.

For many years the Iron Molders' Union, through its local bodies, has agitated in favor of State laws looking to the abolition of the competitive feature of prison labor. The cast-iron hollow-ware branch of our trade has been the most severe sufferer from prison foundries. I do not exaggerate when I say that that branch of the industry, except in the higher grades of ground hollow ware, has been practically turned over to the prison foundries. The stove-plate branch has also suffered in the cheaper grades of goods, but not to such a marked degree as the hollow-ware branch. The local molders' unions took a leading part in the agitation, which resulted in the constitutional amendment in the State of New York which confines the labor of convicts to supplying the wants of State or municipal institutions. The same might be said regarding the agitation which is being carried on at each session of the legislature of Ohio.

The national union has also given its unqualified support to national legislation designed to prohibit interstate commerce in convict-made goods. I am of the opinion that such legislation is essential, that the reform movement in the more progressive of our States should be rounded out and completed. It would be manifestly unfair that the citizens of States which had abolished the competitive feature of their own prison factories should be subject to the evil influences of competition with the prison factories of other States. I believe such prohibitive legislation as I have indicated to be within the power of Congress, and I have no hesitation in saying it would receive the very general approval both of organized labor and of those manufacturers who have suffered by the iniquitous competition of convict-made goods.

Respectfully submitted.

MARTIN FOX,

President Iron Molders' Union of North America.

Q. (By Mr. FARQUHAR.) Did you have a vote in the local bodies or in the national convention before you formed this national committee?—A. No. At the convention of 1890 there was granted to the president authority to make overtures to the Defense Association for the purpose of bringing the two bodies together, to see if we could arrive at some plan whereby we might avoid all difficulties, and the plans that were there outlined for the government of the two bodies were submitted to the local unions for approval. They were all indorsed, excepting one paragraph or one provision relating to the changing of the ratio of apprentices. All the others received the indorsement of the local bodies.

Q. Now, how many districts is the country divided up into?—A. I believe four districts.

Q. Do the employers and the employees agree as to the wage scales in these districts?—A. With the members of their association there is no question whatsoever. The manufacturers outside of the association, with the exception of those in the New England States, as a rule, have granted whatever general advance they have made in wages. Also, with any question coming up with the several manufacturers, we have allowed them to use this same procedure in taking up the cases; that is, in making the comparisons with prices paid by competitors in that district.

Q. In the division of these districts the employers have had the advantage that all other members in that district agree on this scale as to the hours in the district, and consequently they are all on the same basis?—A. In the district.

Q. No privilege as to that?—A. No.

Q. Then your wages are graded in the same way as far as the district goes, so there is no competition there with outsiders?—A. None whatever. Any inequality in prices may at any time be taken up by either side.

Q. So by your subdivision into districts in this way you have managed to cover the whole country?—A. Yes.

Q. And the several manufacturers and foundrymen have done the same thing?—A. Only the stove manufacturers.

Q. The foundrymen are attempting it?—A. Attempting it now, yes.

Q. So this serves two purposes—a perfect and equitable equalization of wages and hours of the men and better rates for the manufacturers themselves?—A. Yes; they recognize that fact fully.

Q. In the convict labor matter—isn't it only about one State that gives you any competition on hollow ware, and that is Pennsylvania? Are there any other States prisons engaged in the manufacture of hollow ware?—A. Jeffersonville, Ind., Chester, Ill., Columbus, Ohio.

Q. (By Mr. LITCHMAN.) On State account or private account?—A. Private account.

Q. Under the contract system?—A. Yes; piece-price plan is about the same thing.

Q. (By Mr. FARQUHAR.) Have you in your national association a strike or defense fund?—A. Yes; we set 58 per cent of our receipts aside for a defense fund.

Q. Is that used as a stationary fund, drawing interest and subject to increase, or is it paid out for the benefit of members on strike?—A. We keep the fund at interest. Of course it has been drawn on largely in the last 5 months in the contest of Cleveland. We pay very heavy strike benefits—\$7 a week—and we usually take care of the member after the strike is settled if he can not get work. We supported a strike at San Francisco for 20 months and at Indianapolis for 24 months. In both these cities the strike was practically lost, but the members did not secure work and we supported them for that length of time. If a strike is declared off and the members can not secure work we generally continue the support of them until such time as we find it unnecessary.

Q. With the Defense Association how many strikes have you had?—A. None since the agreement.

Q. Has your national body, I mean your whole union, increased in the last 10 years?—A. In the last 10 years, yes; considerable.

Q. I think you said what your membership is now?—A. About 65 per cent.

Q. Of the whole number of molders of the United States?—A. Yes. In that we include also molders of less skill than is ordinarily required in the stove-molding and machinery branch of the trade, as in agricultural and even malleable iron work where machinery is being introduced to a great extent. It is practically going to eliminate the highly skilled molder in a short time from these latter branches.

Q. You have at the present time no matter of irritation except probably this undecided apprentice question?—A. Yes; this undecided apprentice question, and the question that has been attempted to be enforced by the National Founders' Association at Cleveland.

Q. As an old trades-unionist, what is your opinion of the benefits to the employer and employee of this present system of agreements? Do you think they are thoroughly beneficial to both parties?—A. Thoroughly so, yes; recognized so by all who have given the matter a trial.

Q. When you made this arrangement did you have in view any other body that had been formed in this country or Europe, to somewhat copy after in making the agreement?—A. No; it struck me as quite original from the fact that both sides were represented by equal numbers. We have no arbitrator in the matter.

Q. Has this arrangement of yours been talked of in the trade journals?—A. Oh, yes; in all the trade journals to a considerable extent.

Q. Have you seen it discussed by other national unions?—A. Yes.

Q. How is it usually received?—A. Not with great favor.

Q. Not with great favor?—A. No.

Q. Is it the idea, they hate to give up the strike?—A. Perhaps I should modify my negative answer a little by saying that some national bodies are inclined to think that our trade is better adapted for the operation of such agreements, from the fact that there are distinct classifications of the molding trade and that it is possible to deal with representative employers' associations of one class, so that there is an identity of interest on both sides. That, of course, is the case as applied to the stove manufacturers. But with the National Founders' Association, which is a composite organization, we have also been fairly successful in establishing a uniform rate of wages in the large foundry centers. By that I mean such centers as Cincinnati, Chicago, Detroit, Pittsburg, and others. In New York wages rule a little higher for obvious reasons, thus demonstrating that the opposition of those referred to is not well-grounded.

Q. Do you think this principle of national arbitration and the fixing of wages, etc., is adapted to other trades than yours?—A. It seems to me it would be to all trades where competition is so general as it is in the foundry business. It could not be applied to the building trades, it seems to me—not so generally. They are more local—governed entirely by local conditions. Competition from the outside may be in the materials, but not so much among the workmen themselves.

Q. (By Mr. CLARKE.) Though you oppose compulsory arbitration, what would you say to a law that would require both parties to a labor difficulty to make an attempt to arbitrate their differences?—A. I doubt whether it could be made practical. I do not know how you could tell an employer or employee that he must arbitrate and, if he did, that he must comply with the award.

Q. If it could be made practical, do you think it involves a correct principle and would be a benefit to the public?—A. Of course I am so much imbued with our idea that I am hardly competent to pass an opinion on that; but I would say this, that through education and practical experience in arbitration we can accomplish more than to attempt by coercive measures or by any legislative measures to bring about the results we desire. There is nothing to compel workmen to comply with the award excepting their organization. We say to our members that, "If the decision is made, you must comply with it." We can not make that man work, though. But we can say to another man, "This man does not want to work; you step into his place." And we protect him in it. It would require organization, it seems to me, on both sides in order to make it practicable to attempt it.

Q. (By Mr. LITCHMAN.) How would you reach difficulties between employer and employee, where the public had a very large interest in the immediate decision of the question involved, like a street-car strike or a strike on a steam railroad or the anthracite coal strike?—A. I would say, if the employees are organized in a reputable organization and they demand an arbitration, the law should go so far as to say to these people, "You must grant them arbitration. If you do not, we have a national board of arbitration that shall inquire into the workings of your institution."

Q. To that extent you would favor compulsory arbitration?—A. It seems to me, to make it practicable, you must have the consent of both parties. It is the only way it could be made effective—to show up the exact condition existing with that corporation. It is only the corporations that we come in contact with that we have any trouble with—that is, so far as the recognition of the trades union goes. They as a rule pay the wages adopted by the union and as paid by foundrymen who abide by union rules and wage regulations.

Q. Indirectly, then, they recognize the union, do they not?—A. Yes; indirectly. I do not call that recognition. We have the strange spectacle in that they will tell me if I go to investigate a grievance, "Now, Mr. Fox, understand werecognize your coming here as a molder, but we will not give your organization recognition." I usually tell them, "If you do not recognize me in my official position, I certainly can do no business with you." And after talking the matter over we are sometimes able to bring them around, and in nine cases out of ten we are able to effect a settlement in that way. But they do refuse to recognize any official of a trade organization.

Q. Is there not a tendency in recent years to a greater recognition of organized labor?—A. Most decidedly.

Q. Now I want to ask you a little about molding by machinery. Is that largely confined to the malleable-iron trade?—A. It confines itself strictly to the smaller castings and where there are many duplicates made of the one piece.

Q. How is it done, in a general way?—A. Of course it would be hard to describe it for you, unless you had some knowledge of the molding trade itself. Generally speaking, the most difficult operation in molding these small castings is withdrawing the pattern from the sand. If the molder allows the pattern to swerve in any way, the mold surface is liable to be disturbed and thus necessitate its repair by the hand tool. In the case of stripping-plate machines, the pattern is withdrawn through a plate by a mechanical operation, and, being perfectly adjusted, there is no danger of disturbing the mold surface. It will be seen that this mechanism supplants some of the greatest skill of the molder engaged on this class of work, and the molding of the piece is greatly simplified. There are a large variety of machines, some designed to draw the patterns as already described, and others to pack the sand in the mold.

Q. There has to be a great deal of hand work with that, does there not?—A. Yes; considerable.

Q. Is the process quicker?—A. Very much. We are hopeful that in a short time we can overcome the difficulty that is being met with, if we can agree with

employers' associations on the wage system which shall prevail in the operation of these machines. The wage question is the real point of friction in the machine problem. But as I have said we hope to agree eventually upon the matter. A great deal of opposition has been met with from employers who fear that we want to "control the machine," that is, as to output. That is not our purpose, for the Iron Molders' Union is on record as favoring the fullest development of the molding machine.

Q. (By Mr. CLARKE.) Is it really a machine, or sets of plates and other appliances?—A. It is what you might call improved appliances rather than a machine.

Q. Have these approved appliances displaced many men?—A. Well, not to my own knowledge. It seems to me the demand has become greater and greater year after year, especially in the case of agricultural and farming implements. In the case of steel and also in malleable iron, it has been brought in so many ways into the construction of electrical machinery, street cars, and so on, and the demand has been so great that I feel it has not made any inroads on the molder.

(Testimony closed.)

WASHINGTON, D. C., December 7, 1900.

TESTIMONY OF DR. ISAAC A. HOURWICH,

Specialist on the law concerning labor unions.

The commission met at 10.42 a. m., Vice-Chairman Phillips presiding. At that time Dr. Isaac A. Hourwich was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. FARQUHAR.) Please state your name, post-office address, and occupation.—A. Isaac A. Hourwich. I am at present in the Government service, translator at the Bureau of the Mint, and reside at Washington, 703 Thirteenth street N E.

Q. I understand that you have some papers to present on the question of the incorporation of trades unions.—A. Yes.

Q. And also employers' liability laws?—A. I have not reduced anything on employers' liability to writing. I will simply speak offhand. As to this other subject, that I thought of great importance, I put it down on paper, so as to be more concise and to consume less time of the commission.

Q. What opportunities have you had in the study of this labor question?—A. I was, in the first place, interested in that question as a student. I taught statistics in the University of Chicago, and I made statistical investigations with the assistance of my class of students. We made a special study of the question of the unemployed in 1893. Furthermore, I practiced law for 7 years in this country, and for 3 years I was counsel to a large organization of labor in New York City, the United Brotherhood of Cloak Makers; and I have also occasionally rendered legal services to other labor organizations in New York City. There was considerable litigation there, with the main object of establishing the status of the labor union as a corporation or an organization before the law. I may flatter myself with having been successful in having every point raised by me upheld by the supreme court of the State of New York; and that, of course, put me to the study of the labor question in all its aspects from the legal standpoint.

Q. What are your views on the incorporation of trades unions?—A. I consider that there ought to be a special law passed which would be adapted to the needs of labor unions as corporations sui generis. I consider that a labor organization can not be incorporated under any of the existing laws for the incorporation of business or any other corporations, because they are not adapted to the particular needs of labor organizations. There is a Federal law for the incorporation of labor unions, but that Federal law, in the first place, is limited as to its scope. It embraces only national labor unions, such as extend over more than one State, and are able to have headquarters in the city of Washington. Now that, of course, would prevent a large number of organizations which extend even over more than one State from incorporating under the Federal trade union law. For example, the organization with which I am familiar, the United Brotherhood of Cloak Makers, has branches in New York State, in New Jersey, and in Connecticut. Now, that would come within the scope of the national or Federal law. At the same time it would be utterly useless and unwieldy for them to have headquarters at Washington. It is too remote; they have no business here, and they are not a national organization in a strict sense of the word. Still they embrace probably about 15,000 workmen.

Q. In what form, then, would you make an incorporation law of that character?—
 A. A law which I would suggest ought to grant the labor organizations a special form of corporate existence. A labor organization organized as a corporation ought to have power expressly granted by law to make contracts for the employment of its members; and there ought to be also a provision to do away with the technical difficulties which present themselves in the enforcement of such contracts—in the way, for example, of the distinction which is usually drawn between the corporation as such and its members. We have made contracts under the general corporation law of New York. I have gone over it a little in this paper, but I can state that orally. We made contracts. There were a number of difficulties presented. For example, the first question would be as to the damage we sustained as an organization from a breach of contract on the part of the employer. The contract was made by us as an organization. We had to prove damage to us as an organization and not to the individual workmen. The chief object of the contracts in the tailoring trade is to secure a uniform rate of wages for a certain period of time. I will go a little into details. Now, the cloak-making trade, which is practically ladies' tailoring, is a season trade. They have two seasons during the year. They generally make contracts with their employers for each season, so that twice a year contracts are made with employers. Those contracts where the union intervenes are made by the union; where the union does not intervene they are made either individually by every workman with the employer, or, as this is a very unsatisfactory way for the employer, he generally calls a meeting of the shop, a shop meeting, and tells them to select a committee and to arrange upon the rate of compensation. It is piecework, and so there can be no uniform rate. They must go over the styles of garments and agree upon a certain price for every garment. The workman must see what kind of work there is in order to prevent differences in the height of the season, and the needs of the employer of labor require a contract to be made for the entire season. Now, when a contract of that nature is made by the union for the employees, which is generally considered by both parties a more satisfactory way of arranging affairs, then, should there be any breach of contract on the part of the employer, as it very often happens, there is this difficulty in enforcing the contract. When, for example, he tells his workmen that he can not pay 75 cents for a garment, that he will pay them 50 cents, because the trade does not warrant the original price, if the workmen will insist upon the terms made by the union and he will tell them he can not employ them, and discharge them, that will be, under the terms of the contract, which is usually in writing, a breach of that contract. Now, if it be a case of an individual discharged before the expiration of the term without just cause, he can go to court for damages resulting from loss of employment. When it is a breach of contract with the organization, then this difficulty arises: Should the individual workman go to court, he is not a party to the contract made by the organization with the employer, and consequently he can recover nothing. When, on the other hand, the union comes into court, the answer is made that the union as such has sustained no damages, or at least can prove no damages from the fact that the contract was broken and its members have sustained damage. There may be a moral damage, but not one which can be readily assessed in dollars and cents. Now, this, as a matter of law, is so as far as the ordinary corporation is concerned, but it is certainly incorrect, in view of the peculiar conditions of the labor agreement. If, for example, fifty or a hundred workmen make a voluntary association and make a contract with the employer of labor, and that employer of labor discharges either all of them or any of them before the expiration of the term, without just cause, simply because he wants them to work below the stipulated rates—then they could go to court and the court would certainly sustain them, because they as a partnership, so to say, have suffered damage, for they have engaged in the employment as a partnership; they are entitled to compensation for the loss of time. It is certainly a legal anomaly when some fifty or a hundred or a thousand men are deprived of these privileges as soon as they take out a charter under the laws of the State, because then the one thousand men, who are practically the corporation, are declared not to have any direct personal interest in the corporation, and consequently the corporation as such and the men composing it are drawn apart by operation of the law. Now, I have argued that before the New York supreme court, and I have been sustained in that contention in a case which I had before the court—the case of the United Brotherhood of Cloak Makers v. Gurewitz. I argued as follows: I said that the distinction between the ordinary corporation and a labor union consists in this: An ordinary corporation is a combination of capitals; people come and contribute, each so much money, but they take no personal interest as such in the management of the corporation except through elect-

ive officers. A labor organization may have a little capital invested in the shape of dues, which is generally barely sufficient to cover the running expenses, but what they do invest is skilled labor. It is, so to say, a corporation of men investing their labors, and consequently, that being the case, there is a perfect identity of interests, as far as employment is concerned, between the members of a corporation and the corporation itself. But the law has no form which would recognize that distinction. The existing forms of corporate law never concern themselves with this peculiar form of combination, because of the fact that up to a very recent date the law in general looked with great suspicion upon any combinations of either capital or labor, and as a matter of fact even to-day combinations of capital, for example, in some cases, or combinations of labor, are not favored by legislation.

I consider that this is an age of organization, both of capital and of labor. We can no more go back to-day to the scattered condition of industry of a hundred years ago than we could do without the locomotive. It stands to reason that modern industry requires large combinations of capital, and it requires also, as a corollary, combinations of labor. As a matter of fact, it is the interest of the employers which requires that labor should be combined. In large enterprises the employer has no opportunity of dealing individually with every employee upon the merits of the individual case. He must make uniform rules, and inasmuch as the other party has also rights recognized by the law, the laborers must select some sort of a committee to represent their demands, their side of it, and that is usually done whether there is a union or no union; so, as I say, the interests of modern industry require that both capital and labor should have the utmost freedom in combination, as far as it benefits the interests of industry and the general welfare.

Q. Now, have you a paper on this very question?—A. Yes; I have that paper on this very question.

Mr. FARQUHAR. If you do not intend to discuss the question further orally, will you please submit the paper now?

The WITNESS (reading). This is an age of combination and consolidation. The corporation has as legitimate a place in our modern industrial organization as the steam engine. It is only in those countries which are most backward in their industrial development, such as Russia, e. g., that the State still looks with suspicion upon corporations. Yet even in this country the old view still governs the legal status of the organization of labor. The trade or labor union is at best only tolerated by the law. What is known as "public opinion" views it as a sort of a reservoir filled with inflammable chemicals, which are at any moment apt to explode.

In truth, labor unions are created by the growth of capital, and are as necessary to our modern industrial order as corporations or combinations of capital. The old patriarchal relation of master and servant is gone; the master no longer deals individually with each employee. A corporation or a large firm has hundreds, often thousands, of employees, for whom it issues uniform rules as to wages, hours of labor, etc. Now, the fundamental law of this country is "freedom of contract." The terms of employment are supposed to be fixed by mutual agreement between employer and employee. It is a bargain, like any other bargain, where the buyer tries to buy as cheap as he can and the seller tries to sell as dear as he can. But where the employer bids for the help of 1,000 hands at once, how can they who sell the labor of their hands assert their terms unless they combine for the purpose? Individual bargaining will not avail; the employer will not pay, for identically the same labor, to one man more than to the other; in fact, the employer can not do it. The terms of the labor contract must be uniform for each class of employment.

In most States the law has recognized this necessity, and statutes have been passed declaring "peaceable cooperation among workmen for the purpose of obtaining an advance in the rate of wages or maintaining the same" not within the law of conspiracy. Still it has been done in a very imperfect manner, and practically the labor union has as yet no standing in court. As the law stands to-day, a contract made between an employer and a labor organization in relation to the terms of employment is very difficult, if at all capable, of enforcement at law.

I shall take up the law of the State of New York, first, because I am more familiar with it as far as it bears on this subject; and, second, because it is probably more liberal than the laws of other industrial States.

First of all, let us consider the status of the labor union. It may be either an unincorporated association of workmen or a corporation.

It must be admitted that under the existing laws a trade union has a more unhampered course if it does not incorporate at all. It is then free to choose any

legitimate line of activity open to an individual, without coming in conflict with the provisions of a corporation law not adapted to the special needs of labor unions. There is a Federal law for the incorporation of labor unions, but it requires the headquarters to be located in Washington. This provision makes it inapplicable to any but the great national bodies. An organization, such as, e. g., the United Brotherhood of Cloak Makers, which has branches in New York and New Jersey, with a membership of about 15,000, can not incorporate under the Federal law.

The New York State law of corporations divides them into stock corporations and non-stock corporations, the latter being again divided into membership corporations and religious corporations. Prior to the latest revision of the corporation laws there existed a law for the organization of cooperative companies, i. e., such associations where the stockholders contribute not only their money, but also and chiefly their labor. The name was retained by the revisers, but the law itself was repealed and no other law enacted to take its place. How is a labor organization to incorporate under these laws? If it incorporate as an ordinary membership corporation, it is no more than a mere social club. Its chief purpose, "cooperation for the purpose of obtaining an advance in the rate of wages," can not be accomplished, for it would be beyond the powers of a social club and would fall within the definition of the objects of a business corporation. To incorporate as a business corporation is impracticable. It would impose upon the labor union the necessity to have a capital stock and to increase it from time to time; no assessments could be levied for current expenses; no "stockholder" would forfeit his membership by nonpayment of dues; no member could be disciplined; stock could be sold by individual members to outsiders who do not belong to the trade, but may be interested in having a controlling voice in the councils of the organization. In other words, a labor union is in its very nature different from a business corporation.

In 1897, being elected counsel to the United Brotherhood of Cloak Makers, I was confronted with this problem of incorporation. In the absence of law on the subject we had to make law, and we accordingly incorporated as a "cooperative corporation," leaving it to future litigation to construe the powers of such a corporation. We had one case in the New York supreme court, where the defense of *ultra vires* was raised against us, and we were sustained by the court. Yet the decision in this case can hardly be said to have established a precedent, since the opinion did not go into a full discussion of the aspects of a "cooperative corporation," nor was it passed upon by a higher court.

Next comes the question as to the methods of enforcing the labor contracts. It is a sad commentary on our law that a labor union has practically no other remedy than a strike against a violation of the labor contract by the employer.

A contract with an employer may be made by the union, as contracting party, or by the individual workmen. The latter method has been practiced in the tailoring trades in New York City. Aside, however, from its unwieldiness, none but an utterly unintelligent employer, such as the average sweat-shop "boss," would enter into such a contract, for it would bind him to keep every workman who happened to be with him at the time the contract was made. Nor does it serve the ends of the union, since it leaves the employer free to hire additional help not belonging to the union. On the other hand, it places the individual member of the union in a position where he may override the decisions of the majority of the organized body, since under the technical form of the contract he is the party to the same and may modify its terms by agreement with the employer.

The only method that suggests itself is therefore a contract made by the union, as such, with the employer. But when the contract is taken into court the union can prove none but nominal damages. Suppose the employer has declared a reduction of, say, 10 per cent on the agreed rates before the expiration of the contractual term, and has locked out the members of the union, who insisted upon union rates. The individual members who lost their positions have suffered damage, but the union is a corporation, and as such distinct from its members. Being a cooperative corporation, it can make no profit on its contracts for itself, and consequently can sustain no damages through a violation of the contracts.

Of course legal ingenuity will suggest some device to so frame the labor contract as to bring it within the established rules of damages. But it means that a perfectly legitimate end must be sought to be obtained under disguise.

And lastly, there is always open the defense of duress. Very often the agreement is reached in the course of or in the apprehension of a strike. Whenever the agreement is sued upon by the union it is met with the defense that the agreement had been obtained by threats to injure the defendant's business in case he would not agree to the terms of the union. That such threats, expressed or

implied, are actually resorted to may be freely conceded. The question is, however, is a threat to injure the defendant's business unlawful?

It goes without saying that a threat to commit violence against the person or property of an employer or anyone else is within the purview of the penal statutes prohibiting threats, etc. But there are cases where one may inflict an injury upon another without becoming liable therefor, either civilly or criminally. If I build on my vacant lot adjoining my neighbor's house it will shut out the light from the same and its rental income will go down—a fact familiar to every land lord in the upper part of Manhattan Island; yet I would not be liable in damages to my neighbor. And if I offer to my neighbor to sell him that lot at my own figure, threatening that I shall otherwise erect a building on it and thus cause him a loss on the value of his property, I am not liable. Similarly, if a walking delegate threatens a manufacturer of ladies' garments that unless he accedes to the terms of the union a strike will be kept on in his factory until the end of the season, and he will lose his orders, which will go to his competitors, it is not against the law. Yet, at least in one case, I have had the experience that a defense alleging, in the vaguest possible terms, threats "to injure the defendant's business," without specifying any unlawful act, was sustained by Judge Truax, of the New York supreme court, as a sufficient defense (on a demurrer). The case is probably not an exception.

In general, it can not be said that the right of workmen to refuse, by concerted action, to work for an employer, if the terms do not suit them, has received unqualified recognition. The common law regards every strike as a conspiracy. The New York statute exempts from this inhibition a strike for the purpose of obtaining an advance in wages, or for opposing a reduction of wages. But as this statute creates an exception from the common law, it will, under the familiar rule, be construed strictly; anything not expressly contained in it is still governed by common-law principles. Now, a strike is not always the result of differences as to the rate of wages, and contracts are often made by peaceable agreement, without resorting to a strike, for other purposes as important to the union as an advance in the rate of wages.

One of the fundamental demands persisted in by every union and strenuously opposed by employers is what is called the "recognition of the union." The demand is usually regarded by the employers as an encroachment upon what is technically known as "the freedom of labor." As a matter of fact, however, it is identical with similar restrictions inserted in every contract, whereby one party agrees to deliver goods or render services to another. If a railway company bids for transportation of troops at so much per soldier, it is quite natural for it to stipulate that it shall have the exclusive privilege of transportation between the particular points contemplated in the contract. If a labor organization makes a contract of employment, it must insist upon a similar provision, lest its contract should become inoperative. Indeed, the demand of an employer for help is elastic, subject to expansion and contraction. He has the privilege of laying off as many hands as may at any time be superfluous to him. If he should reserve the further privilege of subsequently replacing them by outsiders who are not bound by the terms of the union contract, it would enable him to practically rescind the contract with the union without openly saying so.

No less important is the injury to the discipline of the organized body, which must inevitably result from suffering a number of outsiders, not subject to the jurisdiction of that body, to work side by side with the members of the union. A union of workmen will avail itself primarily of the same remedies as a single hired man to enforce the terms of its hiring. In case of a breach of contract on the part of the employer, the individual employee may quit; if he is reasonably certain that he is wanted by his employer he may thus succeed in obtaining redress. But when one-half of the force of a factory do not belong to the union, what will it avail the other half to quit, under similar circumstances, if the outsiders will remain at work? Whoever has had any experience on the labor side of this matter is forced to the conclusion that a union can sooner concede a reduction in the rate of wages than waive this fundamental demand. Now, what is the attitude of the law on this subject?

The appellate division of the New York supreme court has lately made a new departure (in the case of *Davis v. United Portable Hoisting Engineers*, decided in 1898) by adopting the view of the British House of Lords, which has unqualifiedly recognized the right of a labor union to refuse to work with non-union men and to demand the discharge of non-union men where union members are employed. This view is at variance with New York precedents—e. g., the case of *Curran v. Galen*, decided by the court of appeals as late as 1891, where a similar demand by a labor union was held to be an unlawful interference with the right of every

citizen to work at whatever terms he chooses. It remains yet to be seen whether the liberal view of the supreme court will be upheld by the court of appeals.

From all this it may be seen that the law has not kept pace with the industrial growth of this country. The old common-law hostility to "combinations in restraint of trade" has blocked the way of combinations of capital as well as of combinations of labor. Both have developed, however, although denied the opportunity to invoke the assistance of the law. It can not be gainsaid that this is an anomalous condition. These legal relics of a past age handicap labor more than capital.

My brief acquaintance with both employers and employees in the New York tailoring trade convinces me that this condition exercises a demoralizing influence upon both employers and employees. Manufacturers make contracts with labor unions as a mere matter of form. I could name many a cloak manufacturer who told me, while affixing his signature to the contract, that he did not think it was worth the paper it was written on, and that it could not be enforced. I know of many prominent cloak manufacturers who violated their agreements no sooner than they were made; some of them confessed it to me confidentially. (On the other hand, the union, knowing that its agreements must yet be tested in court before their validity may be established, is sometimes impelled to make unreasonable demands upon the employers, such, e. g., as the deposit of cash or promissory notes as security for the faithful performance of the agreement; and, what is still more important, having little expectation of obtaining redress in court, the union quite naturally resorts to the strike, whenever practicable, as the only efficient method to settle its differences with the employer.

What is imperatively needed, is a frank recognition by the law of combinations of labor for the object of fixing the terms of the joint contract of employment. The law ought to recognize the peculiar nature of the trade union as distinct from an ordinary business corporation. There ought to be a law permitting the incorporation of associations of workmen in a manner to give efficiency to their contracts with employers of labor. The law should expressly recognize the identity of interest between the association and its members; it should be so framed that a breach of a joint contract of employment would give the union a right of action for the damages sustained by its members through resulting loss of wages or employment. The scope of this enabling act must be sufficiently broad to include all legitimate objects for which agreements are to-day made between labor unions and employers.

This would virtually introduce arbitration by the courts in labor disputes, thus to some extent superseding the strike by ordinary methods of settling disputes in organized society.

It is one of the first steps to be taken if it is desired to create a *modus vivendi* between capital and labor instead of the present state of warfare.

Q. (By Mr. LITCHMAN.) Your paper states a remedy when the employer fails to keep a contract?—A. Yes.

Q. What remedy would you have in case the corporation of the workmen, which you suggest, fails to keep its contract?—A. Well, I think the remedy which the union would have if a law along these lines were adopted would be pecuniary damages for a breach of contract on the part of the employer. Pecuniary damages could be collected from the union just the same. In the tailoring trade in New York, for example, you will find very often that the union is far more responsible than the employer. You will find there employers who are not worth \$100, who have a few machines and employ about 20 men—these sweat-shop bosses. A union, no matter how small and how weak, has always a couple of thousand dollars in its treasury; so, consequently, in the matter of enforcing contracts, they stand on an equal footing.

Q. (By Mr. PHILLIPS.) Suppose that the damage would be much larger than what they had in the treasury. How would it be collected?—A. That would of course mean that there would be a judgment which could not be collected. There are thousands of such judgments rendered in the courts of New York between private business men. When you have a judgment and you can not collect anything on execution, that is a case which must be contemplated in all commercial intercourse.

Q. Would the labor unions be willing to have such a law where they might be held subject to damages in very large sums?—A. I do not see why they should not. At least the law can not give any such privileges to a labor union which it would deny to an employer, and there is a mutual agreement that if the employer suffers damage by reason of breach of contract by the employees he can sue. As a matter of fact, you will find that in some cases employers of labor, to secure this, demand a deposit on the part of the union or of the individual employee.

In the tailoring trade, for example, in New York it is quite customary for an employer to withhold the payment of a portion of wages as a security that the employee will not leave him before the expiration of the term. That is practiced in regard to cutters. For example, cutters are generally in great demand, if they know their trade; and if a manufacturer of clothing secures a good cutter he generally agrees to pay him good wages, but he will certainly want him to stay in his employment throughout the season, because otherwise he might stay so long as the demand for cutters is not so large and then quit him just in the height of the season, when he can get a better position at better terms; so as security the employer in this case generally withholds a portion of the wages from week to week, which is paid over at the expiration of the contractual term. Now, that is generally sufficient security, and that, of course, can also be done in case of a contract with labor organizations. For example, if the wages should be, say, \$15 a week, \$3 could be withheld and paid over at the expiration of the term, provided the terms of the contract are lived up to. That would certainly give as good a guaranty to the employer as the employer would have in a good many cases in New York. The great complaint in the sweat shops is that the workman never knows whether he will get pay for his work or not. The condition there is this: There are large warehousemen, as they are called, who only keep designers and cutters. They make the patterns, and then they send out all the work to contractors—subcontractors. A subcontractor has generally enough money to pay a month's rent. Very often he has not that. Then he borrows the money from the warehouseman. He has no money to buy machines. Machines are cheap. You can get a Standard machine or a Household machine there for about \$10, but he has not the money to buy that \$10 machine. So he rents that machine; he hires it, from men who deal in those machines, at a stated figure; they have a number of those machines and rent them out. He pays for his machine at the end of the month; probably he pays one month ahead, but that probably does not require very much. Now, he is intrusted by the warehouseman very often with a thousand dollars' worth of work. When he delivers the work it is passed upon by the examiner, and if it is found satisfactory he gets a check; but it very often happens that he makes away with the check. Workmen have worked weeks and weeks and have been left without a cent for their families, and certainly can not recover. So, as a matter of fact, in a good many cases, the employer is no more responsible than any of the poorest kinds of labor unions, and there is no redress in these cases. The United Brotherhood of Cloakmakers has succeeded to a certain extent in weeding out that evil by inserting a provision in its contracts with the manufacturers making them liable for loss of wages resulting from the insolvency of the sweat-shop bosses or of the contractors. That has worked very efficiently. In the first place, in a couple of cases, after manufacturers have lost a few hundred dollars, they have become more careful in the selection of their contractors. In some cases, for example, the manufacturers have taken pains to ascertain the financial responsibility of the contractor; in other cases they take deposits from the contractor or withhold a certain portion of his pay until they are satisfied that the hands are paid. A number of measures were resorted to which were entirely within the power of the manufacturers while they were not within the power of the workmen—the workmen could not protect themselves without that measure. But outside of that particular branch of the tailoring trade and outside of those factories which are under the union rules—and that is not a majority—in a great majority of all the tailoring establishments in the city of New York where, I suppose, about 50,000 workmen, if not more, are employed, there is absolutely no security for a workman that he will be paid for the work he has done.

Q. (By Mr. FARQUHAR.) Is there nothing at all under the lien law of the State of New York to cover that?—A. No; there is nothing; there is a lien law in regard to the building trades. There is also an artisans' lien which covers every trade practically, but the trouble with the artisans' lien is this: In order to be protected by the terms of the law the workman must hold on to the work; the moment the work is delivered there is no lien, and in all these cases the work is generally delivered first and the money is paid over to the contractor, who is technically an employer of labor, and then the contractor will spirit himself away. There is no penal liability, because he is not the agent of the warehouseman. If he were an agent, of course, that would be different; but he is simply civilly liable and that is all. There is a law to protect working women in New York State which makes an employer, who fails to pay the wages of his female employees, liable to arrest in case execution is returned unsatisfied. But that applies only to working women; it does not apply to workmen, to those people who have families to support.

Q. (By Mr. PHILLIPS.) How would it affect, for instance, the railroad brotherhoods, where they would be sued for damages? They might cease work and go

on a strike and the damages might be very, very large indeed to the railroads. Would they be willing to have such a law? So far as I have talked with representatives of large labor organizations they fear becoming responsible; that their organizations could be broken up if they were to be mulcted in damages.—A. Of course, I do not claim to be a specialist in this particular branch and have had no personal experience in this line; but judging from my general familiarity with the law and the facts in this kind of employment, I should judge that in the first place it would be utterly unreasonable on the part of any labor organization to expect the law to grant it such privileges as would not be accorded to the employers of labor.

Q. Would the representatives of the Federation of Labor, say Mr. Gompers and the executive board, be willing to have such a law?—A. Of course, I can not speak for the American Federation of Labor; I am in no way connected with it.

Q. Or the railroad people?—A. I think that any law which would grant a labor union the privilege of suing for damages would of necessity also imply the liability of the union. They would have to see to it that they should not violate the agreement, and if they should I do not see under what proposition of law or fairness, or justice they could be expected to be treated better than anybody else in the country.

Q. (By Mr. FARQUHAR.) Would not the law have to create a person in law? If you intend to get those benefits, would you not have to create a new person to be known in law?—A. I think the union would be the person. The gist of that point is this, that the law should recognize the union as an association, as a partnership, so to say, where the loss of every member of the union, as far as the contract of employment is concerned, should be considered the loss of the union itself, so that there should be identity of interest in law just as there is actually in fact. The theory to-day does not recognize that identity of interest at all.

Q. Does your theory take account of the principle that labor is a commodity?—A. Why, certainly; most decidedly.

Q. Do you take it in its broadest terms that it is a commodity?—A. Why, I would say that labor is a commodity, certainly, but at the same time labor is a peculiar kind of commodity—it is a service, and service is also a commodity. And that is the chief distinction which has not been taken notice of by our law—the fact that the commodity labor is one which must be performed; it is continuous, so to say, in its nature, whereas any other commodity is sold in ready shape.

Q. (By Mr. KENNEDY.) Would this responsibility which you speak of on the part of the labor union go to just simply the funds in possession of the organization or to the property of the members of the organization as well?—A. I should judge that the property of the members of the organization could certainly not be reached, when there is a contract made by the organization, any more than in any other corporation.

Q. Organizations generally collect just about enough funds for their current expenses, and there would not be very much money of the organization generally for employers to sue for.—A. That, of course, is a question. In the first place, as I have suggested before, in case of any contract made by the employer where he does not rely upon the financial responsibility of his employee, he has always an opportunity of withholding a certain portion of wages to be paid at the end of the contractual period. And that portion serves as a security; so there is no particular necessity for having a fund in the treasury. And, then, as I say, if an organization is poor and is irresponsible, it stands in the same position as an employer of labor who is poor and irresponsible. Bradstreet's shows a number of failures every year; we can not help it.

Q. (By Mr. FARQUHAR.) If labor is a general commodity why not incorporate under the law as it stands, and then there is an equality of standing under the common law?—A. I believe that the ordinary laws of business corporations would be utterly inadequate. They could not incorporate under the present laws because, as I have attempted to show to the commission, a business corporation is in its nature distinct from a labor union.

Q. But in the matter of liability, can you divorce these from the general principles of the common law at all?—A. Not at all.

Q. When you come to the liability of two contracting parties, have you not got to take the principles of the common law to establish the liability?—A. Certainly.

Q. Then what divergence can you make in framing a law for the incorporation of trade unions, and at the same time maintain its liability for damages, and give it any other rights than those of any corporation?—A. I can answer that question. Let us take the simpler case of an unincorporated labor organization. Suppose a hundred or a thousand men in New York city form a labor union without

taking out a charter. There is a law in the State of New York which enables unincorporated associations consisting of more than seven members to sue and be sued. Now, what is the case of such an unincorporated association consisting of more than seven members? There is no other law under which it could be treated but the partnership law. Being a partnership, it is liable for the acts of each of its members, and it is also entitled to collect the damages sustained by each of its members. When, however, they incorporate under the general corporation law, then the law says: Here, the moment you thousand men have taken out a charter, you are no longer a partnership; you are not concerned at all; it is this ideal, artificial body, the union, which is the contracting party; you have nothing to do with it; you are simply men hired by the corporation, by the union, to perform the contract of the union; you can sue your union, but you can not sue the other contracting party. What I suggest is that the incorporation should simply define the privileges and the rights of this unincorporated association; in other words, give legal protection to this unincorporated association. Let it remain a partnership—a limited partnership—or call it by any other name. It should not take away any rights from the workmen, but it should simply regulate them and give them a legal entity. That does not necessarily override the provisions of the common law. There are, for example, in a number of States limited partnerships. The nature of a limited partnership is this, that on the one hand it is a partnership and enjoys all the benefits of a partnership; on the other hand, it has also some of the benefits and some of the advantages of a corporation. Now, I say a corporation law for corporations of that mixed nature could be framed so as not to conflict with the provisions of the common law. Of course, I am not called on at the present moment offhand to frame a law; I do not intend to do it.

Q. Now, wherein is the New York law of incorporation defective and wherein would you want that law amended?—A. The New York corporation law is defective in the following respects: First of all, it has a chapter on membership corporations which includes, by inference only, what is called, under the New York statute, cooperative corporations. Now, if permitted, I will just dwell for a minute or so on this particular kind of corporations, because the history of it and the history of that legislation is somewhat interesting and peculiar. There was a law enacted in 1867 for the incorporation of cooperative companies. That law was amended in 1878. The law provided for this particular kind of corporations, which consisted of people combining both their capital and their labor for the attainment of a common purpose. In 1891 the legislature appointed a commission for the purpose of revising and unifying the corporate laws of the State. The commission divided all the corporations into three classes—stock corporations, non-stock corporations, and mixed corporations. Stock corporations contained, of course, business corporations, insurance companies, etc. Non-stock corporations were intended to contain membership corporations, which means social clubs of all sorts, and religious corporations. Then mixed corporations were to contain that particular class of corporations which partake of the qualities and features of both classes. Among these mixed corporations were also cooperative corporations. The general corporation law, in section 2, if my memory does not fail me, contains that classification of corporations into stock corporations, non-stock corporations, and mixed corporations.

Again, under the mixed corporations are enumerated further subdivisions, and among them also cooperative corporations. Then when the commission proceeded to codify the special branches of the law, they first codified the stock corporations, then the non-stock corporations; then they intended to prepare a mixed corporation law, but finally they desisted from that object, made no recommendation as to mixed corporations, but included certain of the mixed corporations under the membership corporations as special branches, and mentioned absolutely nothing as to cooperative corporations, but repealed all the old laws of cooperative companies. So that at present, while we have in the general corporation law a designation of cooperative corporations, we have no laws which would define the powers, the duties, and the nature of those corporations, and we can only surmise as to what they may be. There is a law, I understand, in England along this line somewhat, and, as I understand, there is also a law in Massachusetts and Michigan. I have not given any particular attention or study to this law; but, as I say, you will find no definitions in the judicial decisions as to what is the nature of this cooperative corporation. This remains to be construed.

Now, when we come to incorporate a labor organization under the New York law, how shall we incorporate it? If we are to incorporate it as a business corporation, it will be absolutely impossible for it to work, because one who pays say \$5 or \$10 for a share of stock becomes a stockholder; he can transfer that stock just as any other stock can be transferred; and then, practically speaking, the

result would be that employers of labor might buy up a controlling interest in the organization and the organization would fail of its purpose.

If the union should incorporate as a membership corporation, then, strictly speaking, you can not tell what powers it has. It certainly has the power to call meetings and deliver lectures and have lectures delivered, and that is about all, strictly speaking, it can do under this interpretation of the membership corporation. As I say, I personally have attempted to incorporate a few labor organizations under this cooperative corporation provision, but it has a very shaky foundation. I must confess, because the law does not define it. There has been a decision by Judge Bischoff, if I mistake not, last fall, but that decision did not go very thoroughly into the merits of the case, and it simply sustains my demurrer to a defense of ultra vires. The defense which was raised in that case was that this corporation, being a membership corporation, had no power to make contracts with employers. And this defense, by mutual consent between the attorney for the defense and myself, set forth in its text the provisions of the incorporation act, claiming that under those provisions our union could not sue. I agreed to a certain form of amendment of the answer for the purpose of raising that question before the court. There would not be any interest in fighting over \$500 damages if we could not sustain our general status. This defense was raised in a form free of all technicalities which might obscure the issue and might throw it upon some technical point of pleading. I raised all the points to sustain the contention that a cooperative corporation, while being a membership corporation, could still under the general spirit of the New York law maintain an action for damages, and, as I say, my demurrer was sustained; that is to say, my point was upheld by the court. Still, I say, that can not be considered a precedent. It was passed at special term. There was no thorough investigation or examination of the merits of the case by the judge, because it was not necessary for the judge to do it. There was no appeal taken from it and consequently the question is still in a very uncertain state. And I should not be surprised if another judge would claim that, since there is no provision for cooperative companies, consequently that construction which I have put on it is somewhat strained, and that the general principles of the law of corporations should prevail; and under the general principles of the law of corporations certainly the making of a contract for employment is a business, and consequently ought to come within the purview of the business-corporation law.

Q. Are you acquainted with the principles of the registry law of Great Britain in respect to trades unions?—A. No; I have made no special study of it, so I would not care to testify on it.

Q. Have you ever formulated a law on the lines that you have discussed this morning for the incorporation of trades unions?—A. No; I have never formulated a law. I have simply formulated charters for the incorporation of labor unions, and those charters were submitted, of course, in the regular course of procedure, to the justices of the supreme court for approval, and we incorporated. That is all I have done; I have never framed any law; I have had no occasion to do it.

Q. You intend that the employers shall be bound to recognize the trade union as a party in any contract; is that your plan?—A. My view is that the labor contract should obtain a recognition on the part of the law. If the labor union should be recognized as a contracting party, that, in my judgment, would create order instead of anarchy.

Q. A voluntary membership union can not contract liability in law, can it, as we have them now?—A. Yes.

Q. Only in criminal actions?—A. No; they have the civil liability; they may civilly contract.

Q. In the case of the defalcation of a treasurer of a union, what remedy has the union unless it sues on bonds?—A. I think they have a civil action against him. They have a remedy by civil action of conversion.

Q. Simply the bondsmen; that is all?—A. No; not only the bondsmen. Any treasurer of an organization is in the nature of an employee of that organization, and I think the labor organization, just as any other private firm, would have the power and privilege to bring an action against this defaulting treasurer for restitution of the funds in an action of conversion.

Q. How much further can these voluntary unions contract, as unions, beyond the rent of a hall or a like current expense?—A. I think that a labor union, as a membership corporation, has the power to make any contracts which are necessary in the furtherance of its purposes. For example, a membership corporation can buy real estate. If a membership corporation should decide that it would pay better to buy a building for meeting purposes than to hire a building, it could do so; and if it owned real estate, I think it might even rent out a portion of it to other parties.

Q. Wherein does the nominal ownership of that building rest?—A. In the union, by general name or title, when it is incorporated; and when it is not incorporated, under the laws of the State of New York a union could acquire a title as a partnership.

Q. Do they not acquire the title through trustees?—A. Not necessarily; that depends entirely upon their own rules and regulations.

Q. Do you think under the incorporation law of the State of New York that a union by name could acquire property?—A. Oh, undoubtedly it could acquire by name.

Q. Without naming the parties at all?—A. Without naming the parties at all.
Q. Can you explain why it is that all the great trades unions in this country are against incorporation?—A. That is a subject which, of course, may be considered from different view points. I should say that a great deal of opposition to incorporation probably proceeds from lack of familiarity with the advantages which could be derived from the protection of the law. Most of the active members of labor organizations are not lawyers; they are laymen. Furthermore, whatever occasion they have had to come in contact with the law has chiefly been on the other side. The law has, in most cases, favored the employers' side; at least that is the contention of the union. I think, for example, in cases of injunctions the courts have somewhat extended the equity jurisdiction of courts beyond what lawyers would generally concede to be the proper jurisdiction of an equity court; and, for that matter, I think there is a great deal of prejudice on the part of labor unions. But I think that if order is to come it must come from the law. I do not see any other source.

Q. Now, in the matter of individual bargaining, do you claim that it is competent for an individual and an employer to make a reasonable contract that will hold in law?—A. Oh, yes.

Q. Why is it, if you associate individuals and you make it collective bargaining, that the same principle shall not prevail?—A. The trouble is there that when those people go and make a collective bargain they do it as an incorporated body and as such, of course, they could make a valid contract. But there are a thousand and one difficulties in the way of an incorporated association. Members of that incorporated body may quit employers; others may come in. Now, there will be a question of law whether those who were not members of that incorporated body at the time of the making of the contract were covered by that contract. The number of technicalities which lawyers will invent when they are on one side of the case, in order to beat the other side, is certainly measured only by the ingenuity of the lawyer; and I must say to the credit of the American lawyer that his ingenuity is very resourceful.

Q. You spoke of combinations in restraint of trade, and you also said that capital had as much right—and it was as good for the State—to combine as labor?—A. Yes.

Q. Now, do you call a labor union a body in restraint of trade?—A. I think, to be frank, it is a body in restraint of trade; and that is what the older law in the State of New York considered it. The famous case of the Journeymen Tailors which was decided in the State of New York was certainly a correct presentation of the common-law view of it. In that case the court held that it was an attempt to combine the skill and the workmanship and labor so as to create a monopoly in the labor market, and that was in restraint of trade. I think it is most decidedly in restraint of trade.

Q. How could it be that there could be a monopoly in the labor market when the union is open to all workmen of good character who may choose to join it?—A. Yes; it is not a monopoly as far as the individuals are concerned; but as far as the employers are concerned it is a different thing. If there is, for example, one labor organization in the trade, and if that labor organization controls 75 per cent of the men employed in that branch, and if everyone is practically put to the choice of either obtaining employment and joining the union or going without employment in that particular branch and staying without the union, why certainly that creates practically a monopoly.

Q. But there can not be a monopoly when the labor union can not force anyone to join?—A. That would not make any difference.

Q. Why not?—A. The monopoly would only consist in the fact that they could control labor as a commodity, and he is selling that.

Q. Now, is it not generally understood that labor unions do not compel their membership at all?—A. No.

Q. It is a voluntary matter, of course, to join?—A. Yes.

Q. It is claimed before this commission that only one-tenth of all the working-men proper—that is, that might be properly called journeymen, or men that have

served time sufficient to learn their trade—are in the organized bodies of this country. How can you say that one-tenth could be a monopoly of any trade?—A. Oh, of course not; one-tenth could not. But there are two questions to be considered here. The first is a question as to the actual monopoly, and the next is a question as to the legal monopoly. Now, taking the actual monopoly; there may be some branches of employment where the trade, to use a trade-union term, is thoroughly organized; where, in other words, say, 80 or 90 per cent, or 75 per cent, of all the workmen are in the union. Now, suppose an employer needs 1,000 men; he can get 50 men who do not belong to the union, or 200 men, but he can not get 1,000. Now, the 750 who belong to the union say, Here, Mr. So-and-so, we are willing to work at the terms which you have offered to us, but we do not want to work with those people who do not belong to our organization. Now, the employer has the alternative either to keep the 750 or to keep the 250. He will keep the 750, and the other 250, seeing that there is no opportunity to get a job, will join the union. Although there is no compulsion, theoretically speaking, they will join the union. So I say this is as far as the practical monopoly goes. When there are only 10 per cent or 5 per cent organized in a union, the union can put up no such demand. On the other hand, viewing it from the common-law standpoint, when an organization intends to combine all men belonging to a certain trade, so as to be able to make joint contracts, barring altogether out of the market, so to say, individual bargaining, this is an intended restraint upon trade. It may not be effectual. It will become effectual when they have reached certain dimensions. So I say this is an intent to do away with individual competition, and that is, of course, in restraint of trade. I must say, however, that the restraint is practiced not so much upon the workmen as upon the employers. The essential nature of a monopoly is chiefly this, that it affects the consumer. A monopoly in the manufacture of a certain article affects, chiefly, not those people who have joined the monopoly or those manufacturers who are bought out or become members of the combination, but the consumer, because the consumer can not buy his articles from anybody else but the monopolistic combination. So the object of the union is to control the operations of the trade in that particular branch, and consequently the object is to make it so that the manufacturer can get no help outside of the union. Then it is an intent to create a monopoly. And I think it is well that this should be so for both employer and employee. What I contend is that this monopoly, so to say, is inevitable; it is necessary, but it must be regulated.

Q. If there is the element of monopoly in combinations of capital, as you say, and the element of monopoly in combinations of labor, and these two are combined, what would you call the monopoly then?—A. Well, it would be a combined monopoly.

Q. As against the consumer?—A. As against the consumer, and the State ought to come in to take care of the consumer.

Mr. PHILLIPS. Any other questions to be asked?

Mr. KENNEDY. I think he has covered very well all the points he was to testify on.

Mr. PHILLIPS. But there may be some other questions, or the witness may have something to offer of his own motion.

The WITNESS. I suggested to the secretary of the commission, while having a personal talk with him on the topics upon which I was to testify, the question of employers' liability. I do not know whether that is of any particular interest to the commission.

Mr. PHILLIPS. Yes; we would be glad to have you proceed briefly on that.

The WITNESS. I should like to confine myself to those things upon which I speak, so to say, from professional knowledge; and I mention the employers' liability as it is at present defined by the law of the State of New York, which I consider typical in fact of all the States. I do not think it is necessary for me to restate the propositions of the common law on that subject, because, as far as I am familiar with the reports of the commission, that ground has been covered by other witnesses. But what I want to say is this, that the law of the State of New York, and for that matter probably of all the States, as far as I can judge, for example, from the reports appearing from time to time in the bulletins of the Department of Labor, the law, I say, has not improved upon the common law, has not adapted itself to the new conditions of industry, but, on the contrary, has even taken away some of the beneficial provisions of the common law.

One of the chief provisions of the common law was that the employer was bound to supply his employee with proper machinery, or proper tools, rather; there was no machinery in those days. The question as to what are proper tools, of course, is always a question of fact. But if we take the machinery of our modern industry, where specialists are required to handle it in every branch, it

becomes something beyond the mere tool of primitive industry. There are a number of defects of machinery which are not known to the ordinary journeyman, which he may even see without being able to fully understand the dangers. But, assuming he does see that, the prevailing theory of the law of the State of New York—and, as I say, of all other States—is that if there is any defect in the machinery which is known to the employee, then he assumes the risk of employment.

It seems to me this is a great deviation from the principles of the common law. The common law did not contemplate to absolve the master of liability for defects which were known to the employee. This, practically speaking, does away entirely with the provision that requires the master to supply proper tools or proper machinery. It says he may supply improper tools if the employees know it and consent to it. On what proposition is that based? The general theory is, of course, that the employee is free to assume the risk or not to assume it. He is free to quit employment if he sees that there is a risk. But the situation, practically, is this: The machinery is always provided by the employer and not by the employee, and if he should quit employment in one place he may go to another place and find the machinery the same. Furthermore, the machinery may be in good condition when it is put up; it may get out of repair. Who is to know first when the machine has got out of repair? Of course, the workman who handles it. If he gives notice to the employer or the superintendent, or whoever it may be, and says the machine requires repairs, the courts have held that he has thereby displayed knowledge of the defects, and as he has continued to operate that machine he has consequently assumed the risk of employment. Now, the practical inference would be that as soon as the machine is out of repair the workman must go to the employer and tell him, "You must fix that machine or otherwise I will get out of your employment." In the ordinary course of employment that can not be expected. All he can be expected to do is to tell his superior or his superintendent to put that machinery in good order; and after that notice is given to the employer it becomes the duty of the employer to take care of it. If any carelessness is after that committed by the employer, that can not be covered by the provision that the employee assumes the risk of employment. That provision of risk of employment was a reasonable provision from the common-law standpoint, because, if an employer has done everything in his power to supply his workmen with proper tools, machinery, competent fellow-workmen, and a good, safe place to work in, everything that will happen will be supposed to be the act of God—to speak technically—and the employer can not be held for it. But the act of God does not include human carelessness. As I say, the courts have gone beyond the provisions of the common law in practically nullifying this provision.

There is another thing that is of great importance; that is the fellow-workman clause. The courts of New York have gone to the extent of holding that a foreman, a general superintendent, is a fellow-workman. Now, this, when we take into consideration that most of our enterprises to-day are corporate enterprises, practically does away with the employers' liability altogether. In a corporation there is no employer except the artificial person, and the artificial person can not act otherwise than through agents. Every agent is, strictly speaking, an employee, a workman, of the corporation, and consequently a fellow-workman of the employee who is working at the machine. And if the courts hold further that the superintendent, for example, of a steamship company is a fellow-workman, then that will mean that in the case of a corporation there is no employers' liability, because the liability would always be based upon the act of commission or omission of a fellow-workman. So, strictly speaking, that theory has gone to the extent of practically proclaiming that a corporation is not liable for any injury done to its employees.

This is surely a wide digression from the principles of the common law, and it certainly does not answer the purposes of the State, I might say, to-day. The State has undoubtedly an interest in seeing its citizens safe, at least protected from danger to life or limb, when performing a certain industrial function.

There is another aspect of it. In some of the railroad cases in New York State it has been held that the incompetency of a fellow-workman is not always sufficient to protect the employee who has sustained injury or to impose liability upon the employer. I have a case here in my notes where it was proved that a certain superior foreman of a railway corporation was a notorious drunkard. An accident happened. An action was brought by a workman who had sustained injuries, and the court held that since it was not proved that in that particular case the man was drunk, or that through his drunkenness the injury occurred, therefore the corporation was not liable. Now, I am sure that if that very same drunkard had applied to any charitable institution for \$5 help for his family and it was found that he was a habitual drunkard, he would have been refused assist-

ance. In this case I say the court has certainly gone beyond the intent of the common law.

Furthermore, let us see what is the particular application of it to railway labor. The general proposition upon which the courts proceed in all these cases is this: The man is free to quit employment if he does not like it, if he knows that his fellow-workman is incompetent, or if he knows that the machinery is imperfect. An incompetent fellow-workman, say a yard-master or a brakeman or anyone else, may endanger the lives of a number of employees. Assume for the sake of argument that a number of employees know it; they all know of his incompetency, or they all know of the danger of a certain machine or the imperfection of a certain engine. Such cases have come up. Suppose they all give notice to the employer that those things have to be repaired, or that this employee must be removed. Suppose there is a difference of opinion on the subject between them, and the superior officer or the superintendent, who has charge of hiring and discharging help, hears them and their demands are refused. If they should go out in a body—all those 100 men or 1,000 men—and make that a cause of quitting work in a body, then their action comes under section 673 of the New York Penal Code, which declares that if a number of employees of a railway quit work and thereby endanger valuable property they are criminally liable. On every railway crossing, in every depot, there are millions of dollars' worth of valuable property, and if a thousand men should refuse to handle it that property may certainly depreciate and may be exposed to the action of the elements—an injury may be done to valuable property. So, practically speaking, the remedy which the theory of the law assumes they have is barred by the statute.

Under such conditions, when they have not the choice of quitting, when they can not tell the company, for example, as some of the decisions say, that it should provide them with safer machinery, it should guard all dangerous machinery, or it should have more modern appliances, etc.—the courts hold that they need not have the most modern improvements—I say, that under those conditions it practically means that all liability is done away with, and that the theory of the assumption of risk means the assumption of risk resulting from the employer's carelessness.

So the conclusion to which I have come after a study of employers' liability laws in the State of New York—I think I have gone over pretty nearly every decision there is in the reports of the New York courts—is simply this, that there is no employers' liability under any circumstances under the present laws of the State of New York, as construed by the courts; and I think that there is certainly a need of some law which should protect the employee to-day just as the common law protected him two or three hundred years ago. We have outgrown the conditions of the common law in the first place, but, in the second place, whatever beneficial features there were in the common law have been done away with by the interpretation of the courts.

Q. (By Mr. FARQUHAR.) What say you to the theory that the business itself shall be the responsible party ultimately?—A. I think that is a perfectly reasonable theory, in view of our modern conditions. I made that point about 10 years ago in an article in regard to the liability of railway companies in Russia. I stated at that time that I thought that a certain number of lives are inevitably lost in the course of our modern industry—you can not prevent it. People are to a certain extent careless, and you can not prevent it, and not every one of us is a great civil engineer so as to know all the dangers. Now, I said that that being the case the proposition should be treated in a brutally frank manner, in the same way as it would be treated in the old days of slavery. If a slave was injured, it was so much injury to the owner of the slave. Of course, we are to-day free, but, practically speaking, there is always a certain danger attendant upon industrial employment, and that danger is not of such a nature as to be thrown on the shoulders of the individual. It is the industry of the country at large which consumes these lives and limbs, and consequently the country at large should be made responsible for it. I do not mean that the individual employer, John Smith, should suffer the damage, as, of course, it may be too hard on John Smith, who may not be responsible; but the country at large should make some sort of provision for these cases. A national insurance law, for example, or some provision to that effect, would probably cover the ground.

Q. (By Mr. PHILLIPS.) That could not be done under our Constitution except as to interstate commerce, could it?—A. It might not, except as far as interstate commerce is concerned, but it could be done under State laws in those branches not within the interstate-commerce provision.

Q. (By Mr. FARQUHAR.) In framing an employers' liability law, would you go so far as to make it a provision that employers would be liable for all accidents, even though not caused by negligence or defects?—A. That is, of course, a diffi-

cult question to answer. It would be very largely governed by sentiment. One might say it would be no more than right to do so, and another might say it would be wrong to do so. I think, however, that the question of personal negligence ought to be eliminated altogether. I think if there is a certain defect in the machinery, for example, it is the proper duty of the employer to see that the machinery should be in good repairs; and I further think if there are dangerous processes which have been superseded by more perfect processes, as in the manufacture of matches, it is no more than right that the employer should use the better process. For example, I know there are certain kinds of matches, the so-called Swedish matches, which are said to be perfectly harmless to the health of the employees, while the ordinary matches are harmful. In some countries the law has prohibited the manufacture of these matches. I give this simply as an illustration. If there are two processes, of which one is very elaborate and protects the life of the employee better than the other, which is cruder and consequently cheaper, it should be considered the public duty of the employer of labor to take the safer course.

As a matter of fact, to-day any employer in the larger branches is to a large extent performing a public function. Railways are operated, of course, primarily in the interest of the stockholders and bondholders, but at the same time you and I and everyone in the community has an interest in the way railways are operated; and so with other large branches of industry. That being the case, I say those who manage these industries have also certain duties with regard to the general welfare of the country, and consequently there should be certain obligations imposed upon them by law to provide the best ways and obviate, as far as possible, all dangers incident to production and manufacturing. Of course if anything can not be avoided, then it would be a question as to who should bear the burden. People might argue that the burden should be borne by the employer, or the employee, or by the public at large, according to their views as to which would be the best and most suitable solution.

Q. What would you say about contributory negligence as affecting liability?—

A. Well, I have partly covered that by the "assumption of risk." That assumption is contributory negligence, but of course the question of contributory negligence is broader than the question of assumption of risk.

I think I have partly answered it by saying that there is a certain degree of negligence inherent in every man, regardless of the degree of intelligence. I know I was myself pretty nearly killed by a street car in Chicago a few years ago, and I am generally a pretty careful individual. When people work on railways and have to cross the tracks right along they can not observe the same degree of care as a passenger or a passer-by can or would. They naturally grow so familiar with these dangerous appliances that a certain degree of carelessness becomes natural to them. It is very difficult to draw the line between this carelessness in handling a locomotive, for example, which is a part of the trade, so to say, and the carelessness which consists in not taking the necessary precautions. That question of contributory negligence is one of the pitfalls, I should say, of the law.

The law of the State of Illinois has a better theory—the theory of comparative negligence. That theory of comparative negligence consists in this, that if there was negligence on both sides, it is the province of the court to decide whose negligence was paramount in causing the injury; and if it is found that there was negligence in the case of the employee, but there was still greater negligence on the part of the employer, the defense of contributory negligence will not avail.

I would say this is not by any means a very radical departure from our actual law. If you will take the laws relating to common carriers in handling freight, you will find there the law of contributory negligence reversed. The general proposition, for example, in suing a common carrier for damages, where the action is brought by an employee, is this: The employee must prove he was perfectly guiltless of contributory negligence. When an action is brought by a shipper for the loss of freight, the common carrier must prove that it was perfectly guiltless of any contributory negligence. The burden of proof would be on the company; and if there is any negligence on the part of the company, no matter how negligent the shipper may have been, even if he himself loaded the freight and there was a defect in the loading through which the injury occurred or the damage was sustained, it was the duty of the common carrier to see that it was properly loaded; and if it was improperly loaded by the shipper and the carrier accepted the cargo, then the common carrier is liable.

So there is this provision making the common carrier liable for any damage to freight even sustained through the contributory negligence of the shipper, on the one hand, and on the other absolving him from any damage even resulting from

his own negligence when there was negligence on the part of the employee. This is certainly somewhat contradictory.

Q. (By Mr. LITCHMAN.) How far do the changed conditions that formerly made the common law applicable affect employers' liability now?—A. I think that the changed conditions consist mainly in the divorcement, I would say, of the individual workman from the skill and scientific principles of his trade.

Q. Is it also affected by the fact that employment is no longer personal, but corporate?—A. I think so, most decidedly.

Q. That practically the real employer is now a corporation?—A. Exactly.

Q. He is removed from any personal contact with the employer?—A. Exactly.

Q. By reason of that fact there has grown up an application of law foreign to the intent and humanity of the old common-law practice?—A. I subscribe to that view.

Q. (By Mr. CONGER.) I understood you to say earlier in your testimony that in the case of accidents resulting from the acts of a fellow-servant the corporation has been practically held free from employers' liability, so called?—A. Yes.

Q. Is it not a fact that in some of the States the courts have held the manager of a corporation or the superintendent to be a vice-principal, or, in fact, an employer?—A. Yes; there are some States where legislation has intervened to remedy the defects of the common law as construed by the courts. In other words, there has been a twofold activity in this country in forming the law of employers' liability. The courts have construed the law farther away from the sound principles of the common law; on the other hand, the legislatures of the several States which have taken up that question have endeavored to define the law so as to secure all the advantages of the common law and also to add some new safeguards necessitated by the growth of industry.

Q. Has that been done by legislation in many of the States?—A. My knowledge is chiefly from books, of course, and very largely from what I have seen in the compilations of the Industrial Commission, but it has been done very largely in some of the States.

Q. Do you know if that provision has generally been effective to protect the interests of the employees?—A. I should not judge myself competent to answer that question.

Q. In theory do you consider it a good practice for legislatures to attempt that designation of superintendents and managers as vice-principals or employers?—A. I think if the courts have failed to do so, it is certainly the duty of the legislatures to do so.

Q. (By Mr. PHILLIPS.) Have you anything further to state that you have omitted?—A. Yes; I might say a few words on a question which I understand is a subject of investigation of this commission, namely, the question of the unemployed. I would speak of what I have personally done in years past. Of course I do not think it is proper for me to go into any great details. I may say that in 1893, during that great industrial depression, I was in charge of the chair of statistics in the University of Chicago. I undertook at that time, with the assistance of my class of graduate students, to study the conditions of unemployment. We collected a large mass of material. As a matter of fact, a great deal was done at that time by various institutions in the city of Chicago to ascertain the conditions. There were two police censuses taken. I have the data of those censuses. There were also about 20,000 blanks filled by the Central Relief Association, which was at that time organized—if I am not mistaken, with Mr. Lyman Gage as chairman—by the Civic Federation of Chicago. They went to work in a systematic manner. They would not give indiscriminate aid, but tried to ascertain the facts by investigation in every case. Twenty thousand cases were examined into by them. We tabulated these figures. Of course it is only in rough shape; as I say, that was done by myself and my students. Further, there were data on file in the office of the factory inspector, which we also perused. In addition to that we also made personal investigations. We took typical cases, went out to various districts and branches of the unemployed population, and we have about 800 personal descriptions made by the students and myself, I think. We looked up people who applied for relief and visited them at their houses. We looked up people sheltered by the city. At the city hall very rough provision was made for them at the beginning, before further provisions could be made. We also took up such an aspect of that question as the Coxey army, for example. I went with a party of students to the camp of the Coxey army, and we examined them personally, and I think I have about 250 answers. In fact, every conceivable phase of that question at the time was practically covered. There was a vast amount of material collected, but of course it required a great deal of labor to work it up, and

then it required my time to make a report on it; and I at that time left the scientific field for practical work. I went to New York to practice law, so I had to leave it as it was, in crude shape. But I could say that there was a great deal of very valuable information gathered by us, which could very easily be presented to the public and which is not obtainable in ordinary times.

Of course the question as to the cause of unemployment at that time was plain. It was due to the industrial depression. The answers given by employers of labor to the police of the city of Chicago as to the numbers employed by them at that particular moment and in ordinary times disclosed about 40 per cent of reduction in the working force of the establishments. So that, of course, was an acute outbreak of unemployment. But at the same time, by taking up the information contained in the various blanks, and from all these sources, a certain residue of unemployment was also discovered which would not result from any acute outbreak. There are season trades, for example. In taking up the returns of the factory inspector, we found that there were, periodically, weeks or stretches of unemployed time which could not be by any means ascribed to any acute outbreak of the industrial crisis.

Furthermore, as to the personnel of the people. A great many accepted notions were proved to be somewhat hasty. The general belief in Chicago was that people were flocking to Chicago as to some sort of a central tramp exchange, so to say, by reason of the assistance by the Chicago municipality. Now, the investigation showed that they were nearly all residents of the city of Chicago, and proved that only a very slight percentage of all the applicants for charity had not been residents for a period of years in Chicago. So that was one element disposed of.

There was another very interesting fact which I think was perfectly new to me and probably to a good many others. It was this. Every man has to pay his rent if he wants to live somewhere. The figures as tabulated show that of those who applied for charity, the average out of 20,000 cases were indebted for about 3 months' rent. Now, that meant that the landlords of the city of Chicago tolerated these tenants in their apartments for 3 months, although they had the perfect privilege of throwing them out on the streets. This was an aspect of the relief not advertised in the papers, but at the same time given by the business community of the city of Chicago to the unemployed.

Furthermore, there was another question which was also made clear by the figures which I had. The average time of unemployment—taking all the cases I have—was about 5 months. Now, that did not show that these persons were unemployed only 5 months, but that it took about 5 months before the men went to the charity organization. It showed that for 5 months these people were able to eke out an existence or make both ends meet somehow or other. For 3 months of this time they did not pay rent, but for 2 months of it they did pay rent. By looking up the question of how much property was mortgaged and pledged and pawned, etc., we found there were very few cases of that kind. So the inference was that the rent for those 2 months must have come from some source, and that source was probably savings: there was no other source. That showed there must be in the hands of the workmen usually a certain fund of savings in ordinary times to provide for an emergency of that nature. This is also one of those sources of relief of the unemployed which is not generally taken very much note of. I think it is a most effective force in dealing with unemployment. If those people were able to keep above water for 5 months before applying for help, that means if there is an industrial depression or slack season which lasts less than 5 months they are able to tide over. So that bears on the question of the relief of unemployment.

Q. (By Mr. FARQUHAR.) Did you find that recourse had been had to chattel mortgages before they applied for public relief?—A. No; it had not been done because probably there was not very much to mortgage. There was a question of that kind propounded to every one as to how much was mortgaged. That was in the figures obtained by me. That was in the blank. They were not filled in all cases, but there was some information gathered on that point.

Q. (By Mr. PHILLIPS.) How much of this burden, if any portion of it, did you ascertain was entailed on the grocerymen, merchants, and clothiers? I have had some experience myself and have found that workmen who have been dealing and paying promptly are likely to get credit.—A. Exactly; that question is covered. I have figures bearing on the grocer, milkman, baker, and butcher.

Q. Did you not find a large proportion of the care of the unemployed was entailed on the merchants?—A. I think so. Probably the landlords and the grocers were the ones who really supported the unemployed during the crisis.

Q. It was not, then, so much their savings?—A. At the same time there is a limit to that. People had a certain amount of credit. If my memory does not fail me,

there was about \$20 to \$25 due from some families. In the first place, all could not get credit; and, in the next place, the amount of credit was not sufficient to carry them over 5 months and enable them to pay rent for that portion of the time.

Q. In your investigations have you taken into consideration any means of remedying the evil of unemployment, or to give relief or labor to the unemployed?—A. As a matter of fact at that time I did not concern myself so much with the remedy. I thought, as a doctor, I ought to diagnose the disease. I was studying the facts and I thought I would leave the remedies to legislatures. My investigation was chiefly statistical. I did not think at that time at all of offering any panaceas. I wanted simply to study the conditions.

Now, of course, to-day there is no acute unemployment. We are living in an era of prosperity. At least my present work has shown me that in the last year we had about \$80,000,000 more of gold in circulation than the year before, and that conclusively shows there was more business transacted in this country. But at the same time even now you can not say there is no unemployment at all, because the nature of a good many trades is such that they are season trades. Agriculture is a season trade, and a great number of people have to look for work during the winter months. You find a number of other industries the same. Take the tailoring trades again; they are generally busy a portion of the year and altogether slack the rest of the year. In fact, our industries are now somewhat seasonal in every branch of trade, so there is always some percentage of unemployment.

A comparison, for example, of the data which were collected during that industrial depression and of the data for a prosperous year would eliminate the residue of unemployment due to lack of providence on the one hand and on the other hand to ordinary conditions. It would be very easy, for example, to get at the information of the Relief and Aid Society of Chicago to-day—tabulate it, and compare with the figures which I have. Now, that would show the whole thing during 2 years—say a year of depression and a year of prosperity, and would give a thorough insight into the question of unemployment.

Q. (By Mr. LITCHMAN.) How much value could be attached to this investigation of 1893? How much value would it have without a comparison with the conditions that exist at the present time?—A. Without a comparison, of course, it would give only an idea of the condition of unemployment during a period of extreme depression.

Q. (By Mr. A. L. HARRIS.) How far did intemperance enter into the cause of unemployment?—A. There were figures as to that also. A number of applications were rejected by the examiners for drunkenness; but such cases, I think, amounted to about 1 per cent or less.

Q. (By Mr. FARQUHAR.) I suppose they would then waive that matter of intemperance on the ground of charity and sympathy, of course?—A. I do not think so; because there were express cases where aid was refused on account of drunkenness, for example, and on account of bad habits, etc. They made a point of ascertaining the character of the families which they assisted.

Q. (By Mr. LITCHMAN.) Do you recollect if any of this idleness or nonemployment was peculiar to skilled or unskilled labor?—A. I have figures as to that. I do not think it would be right for me to give you any general statement. I think, however, that it was about evenly divided between skilled and unskilled, but I would not be ready to say to-day.

Q. It affected apparently both classes alike?—A. Yes.

Q. (By Mr. A. L. HARRIS.) Did you note how far organized labor was responsible for unemployment?—A. Organized labor did not come in there at all. In the first place most of the people in Chicago at that time were not organized; and somehow or other there were hardly any cases of organized labor applying for charity. Consider it as you may, there was either less unemployment or they were better paid and could stand it longer, or they may have been aided by their organizations. I would not be willing to make any generalizations without having the facts for it. The fact is, however, that organized labor was not very frequently in evidence.

Q. You investigated along that line?—A. I thought about this myself and I put these questions personally, and I met very few cases of men belonging to labor organizations.

Q. (By Mr. FARQUHAR.) Any strikes prevailing?—A. No; of course no strikes could happen when 50 per cent were laid off.

Q. (By Mr. A. L. HARRIS.) Take the condition of affairs which now exists in Chicago, would organized labor conduce to unemployment or nonemployment?—A. You mean in the nature of strikes?

Q. Yes.—A. Well, I should not be inclined to class this kind of unemployment under the general head of unemployment any more than if, for example, I am looking for a position at \$3,000 a year and would not accept a position for \$1,500.

Q. Is it a fact that many men do seek employment who are not members of trade organizations and are not able to get employment on account of not being a member of the trade organization?—A. Well, I really could not answer that question. I think in the organized branches there may arise such contingencies—where people who do not belong to the trade-union might be barred from employment—if I understand correctly the question. These cases might arise, but the remedy is simply by joining the organization.

(Testimony closed.)

WASHINGTON, D. C., December 8, 1900.

TESTIMONY OF MR. W. F. WILLOUGHBY,

Department of Labor, Washington, D. C.

The commission met at 10.50 a. m., Vice-Chairman Phillips presiding. At that time Mr. W. F. Willoughby appeared as a witness, and, being first duly sworn, testified as follows:

Q. (By Mr. FARQUHAR.) You will please give your full name and address.—A. William Franklin Willoughby, Department of Labor, Washington, D. C.

Q. How long have you been connected with the Department of Labor?—A. Ten years, since 1890.

Q. On what principal lines of investigation have you been engaged?—A. Principally on investigating labor conditions in Europe.

Q. You have just returned from an investigation in Europe—from some investigation in connection with the Paris Exposition?—A. Yes.

Q. What were your principal duties?—A. I was appointed a special agent to assist in the collecting of material to be exhibited by the United States in the section of social economy at the exposition. On the opening of the exposition I went to Paris as a juror in class 105, having to do with the prevention of accidents and schemes for compensating injuries resulting from accidents. I also served as a juror on the group jury treating of all social questions, and the superior jury revising awards for the whole exposition.

Q. You are familiar with the British compensation act, are you?—A. Yes.

Q. And also with the old act of which that was amendatory?—A. Fairly so.

Q. How many visits have you made to Europe?—A. I have made five investigations in Europe.

Q. In what years?—A. Stating it from memory, in 1891, 1892, 1894, 1897, and 1900.

Q. Would you name the special duties that called you there these several times?—A. The first visit was to investigate technical education in Great Britain, and also to assist in collecting information as to the housing of the working classes of Europe. The second investigation was that of industrial communities, somewhat similar to Pullman's in this country. The results of that investigation were published in the bulletin of the Department of Labor. The third visit was to represent the Department at an international congress in relation to accidents to labor and workmen's insurance, which met at Milan, and also to make some special inquiries, which are not of importance, so I will not mention them. The fourth visit was to collect data concerning the cost of production in Great Britain and Belgium, and to represent the Department at the international congress in relation to labor legislation and the international congress in relation to accidents to labor and workmen's insurance at Brussels. That was in 1897. My last visit, in 1900, was as a juror in the section of social economy, as I have described.

Q. You also took up for the Department of Labor the labor laws of the various countries?—A. In the meantime I have made studies for the Department of Labor of labor legislation in all the principal European countries, which have appeared in successive numbers of the bulletin, and it is expected that these will be republished as a special report early in the spring.

Q. Will you please state to the commission the industrial and other features that have led up to these liability acts of Great Britain and elsewhere, and at the same time in your own way explain the laws?—A. The problem of employers' liability is of course a complicated one, and all I can attempt to do will be to state the broad lines of the movement for the reformation of these laws. This movement may be divided into a number of distinct steps.

There was first the condition of what in this country is called the common-law liability of employers. The conditions at that time in Europe under that law were practically identical with those that exist in this country where no special statutes have been passed extending the principles of employers' liability. Under it the employer was responsible only for those accidents resulting directly from his fault or the fault of his agent, whose orders the injured person was in duty bound to follow. I should like to point out the significance of this law. Its application was that only those accidents were indemnified that were due to the employer's fault, and then only when that fault was clearly established by the injured person. On the other hand, the workingman bore the consequences, not only of accidents due to his own personal fault—which is probably just—but of fortuitous accidents, or accidents caused by his fellow-employees, and those whose occurrence, though due to the fault of the employer, could not be legally proven.

We can thus classify accidents according to responsibility in the following five classes: First, those due to the employer's fault, provable; second, to the employer's fault, not provable; third, inherent in the industry—what is known as trade risk; fourth, fellow-employee's fault, and fifth, the injured employee's fault.

It is simply necessary to call attention to the injustice, in my opinion, of this old common-law employers' liability. At the time that custom sanctioned it and gave it the force of law the employee was in intimate relations with the employer. Should an accident occur it was an easy matter to determine the responsibility. But the growth of production on a large scale made these principles largely inapplicable under modern conditions.

The question of responsibility is exceedingly difficult and often impossible to trace. Leaving out of consideration the fact that the employer is better able to stand the financial burdens entailed by accidents, there is to my mind no reason in equity why the employee should bear the consequences of accidents due to fortuitous occurrences, acts of fellow-workmen, etc. It is the industry that causes them, and it is upon the industry—or the employer—that the burden of their consequences should in some way be made to fall. In other words, the risk of accidents inherent in the industry is quite akin to that of the breaking of machinery, failure or loss in any other way, and as such should constitute a normal item in the cost of production.

Now, taking up the different measures and steps of reform, the first and most patent injustice of the old law was that which threw the burden of proof on the employee in any attempt to recover damages. In the movement for reforming the law, therefore, the first demand that was made was for what was called inversion of proof; that is, throwing the responsibility or the burden of proof upon the employer, making him liable unless he could show that the damages resulted from the employee's fault. The employer is certainly in better position to gather proof and to protect himself than the employee. That was certainly a just reformation.

It soon became apparent, however, that even with this point gained, but a slight measure of reform would be accomplished. Statistics which began to be gathered showed that a considerable proportion—in the neighborhood of one-half—of all trade accidents were due to forces practically beyond human control; that is, they were inherent in the industry itself, such as, for example, would be the falling of coal in coal mining, and similar accidents that can be scarcely avoided, no matter what the precautions. These statistics that were gathered with a great deal of care show that each industry had what was called its trade risk; or, as it is usually called, *risque professionnel*.

I will give the following figures, showing the German statistics regarding accidents, classified according to responsibility. Of accidents 19.78 per cent were shown to be due to the fault of the employer; 25.64 per cent were due to the fault of the injured employee; 4.45 per cent were due to the fault of the employer and employee jointly, and 8.28 per cent to the fault of a third party, or a total of 58.15 per cent due to personal fault. On the other hand, 43.40 per cent were shown to be due to trade risk, and in 3.47 per cent the responsibility could not be traced.

The result of this statistical showing was that persons interested in the question asked themselves why the employee should bear the burden of those accidents that were due to the industry rather than the employer. They were accidents the same as the explosion of a boiler, and should constitute an element in the cost of production the same as accidents to a machine.

The next step in the reform, therefore, was the demand that the employer should be responsible not only for all accidents that he could not prove were not due to his own fault, but also all accidents due to trade risk, using that expression in the technical form which is now universally adopted in Europe as indicating those accidents inherent in the industry itself.

The third step in reform was this: Even with these points obtained, the employee could only receive compensation as the result of a lawsuit. The burdens and delay of litigation were intolerable. Efforts were therefore made to devise some system for preventing this kind of litigation. The device was therefore resorted to of fixing in advance the amount of indemnities that should be paid in case of each class of accidents and also of simplifying judicial procedure by providing for boards of arbitration by which the representatives of the employer and employee could determine the amount of the indemnity due in each particular case, an appeal always lying to the regular courts.

As soon as the point of fixing indemnities in advance was reached the provision against these risks by means of insurance naturally suggested itself. What I have wanted to show by this general statement was that the whole problem of workmen's insurance against accident has furnished an exceedingly interesting example of the evolution of a social problem. Starting in with very slight measures of reform, the movement has gone on by a natural process of evolution and elaboration until the principle of insuring against accidents is practically universally adopted in Europe and Great Britain. The British compensation act, while it does not make the insurance compulsory, expects that all employers will insure against that risk, and in point of fact the great majority are doing so.

I will now take up the particular action of the different countries. Germany was the first to take radical action. After reforming its employers' liability laws by various acts, it finally, in 1884, passed its famous compulsory insurance against accidents act, by which it is compulsory upon employers to insure practically all of their employees against accidents. The entire burden of this insurance must be borne by the employers; that is, Germany has gone so far that the compensation of all accidents, except those willfully caused, is borne by the employers, by making it compulsory for them to insure their employees against accidents.

The annual report of the New York bureau of labor for 1899 gives a very thorough study of the organization and practical working of not only the German compulsory insurance act, but the insurance and compensation acts of other countries in Europe.

Austria created a similar law in 1887. It provides for the compulsory compensation of accidents, as does the German law, at the cost of the employer, with the exception that one-tenth of the premiums for insurance may be deducted from the employees' wages. In point of fact this is rarely done. In a great majority of cases the employer pays the whole premium.

Great Britain passed an employers' liability law in 1880, increasing somewhat the liability of employers for accidents. That was, however, far from a radical measure. In 1897 it passed what is known as the workman's compensation act. The important features of this act are that it unequivocally accepted the principle of trade risk and of compulsory compensation that is found in the German and Austrian laws, with the exception of the one class of accidents due to the serious and willful misconduct of the injured person. That is the only exception made. With that slight exception it has adopted the German and Austrian theory that the compensation of all accidents should fall upon the employer. It, however, refused to adopt the German system of compulsory insurance; that is, a distinction is made between compulsory compensation and compulsory insurance. The principle of compulsory compensation it accepts, but it preferred to leave the employers to cover their risk as they see fit; but the act makes special provision by which employers can organize insurance institutions. These institutions must be submitted to the registrar-general of friendly societies for his approval.

France, by a law of April 9, 1898, also passed a compulsory compensation act which follows fairly closely the English system. That is, compensation is compulsory, but the employers can insure themselves or not against this risk. I will say that prior to the passage of this act all of the more important industrial concerns, such as railway, mining companies, and large metallurgical establishments, had voluntarily created funds for the insurance of their employees against accident, and the State itself had established a national State insurance institution covering accidents, the use of which was voluntary. It was an ordinary practice then for employers to insure their employees against accidents in this national insurance institution. In some cases employers in the same industry organized a mutual insurance fund. The best example of that is that organized by the Central Association of Iron and Steel Manufacturers, corresponding to our American Iron and Steel Institute. They organized a fund supported entirely by the employers, to which all the more important manufacturers in that industry joined, for the purpose of insuring their employees. I state these facts merely to show to what extent the question of providing for the compensation of workmen against accidents has gone in Europe, and the fact that it is not only recognized by law

in these countries that the compensation should be made by the employer, but that the employers themselves had, and to a very large extent before the laws were enacted, recognized the justice of this position and voluntarily done that which the law afterwards made obligatory.

Italy passed a compulsory compensation act on March 17, 1898, similar in general lines to the French and English.

Spain did the same by an act of January 30, 1900.

Norway, by an act of July 23, 1894, passed a compulsory compensation and compulsory insurance law, thus accepting the German system. Finland did the same in 1895, and Denmark the same by a law of January 7, 1898.

This statement of the laws, most of which it will be observed have been passed within the last 3 or 4 years, shows that practically all European countries—the only industrial country excepted is that of Belgium—unqualifiedly accept the principle of compulsory compensation, and some of them that of compulsory insurance as well.

Q. (By Mr. PHILLIPS.) How is the amount of the compensation ascertained under these laws in these various countries?—A. As I have said, all of these laws fix in advance the amount of compensation that will be paid according to the extent of the injury, and for this purpose accidents are classified, not according to the particular injury inflicted, but according to the extent of the disability resulting.

The almost invariable system is to divide accidents into the following classes:

First. Those causing death.

Second. Those causing total permanent invalidity.

Third. Those causing partial permanent invalidity.

Fourth. Those causing temporary invalidity, whether partial or total.

All of the laws in regard to class 4 provide a minimum; that is, only accidents causing disability over a certain number of days, or a certain number of weeks. In the German system the minimum is rather high—14 weeks—but this is due to the fact that Germany also has a system of compulsory insurance against sickness, and these minor accidents are taken care of by the sick fund. The same is true of Austria. Where a system of sick insurance does not exist, the minimum is usually a few days.

The scale of benefits is then fixed in about this way: In case of death, either a lump sum or a pension, where an insurance system is also provided for the widow or orphans; and in case of permanent disability, whether partial or total, a pension is paid the injured person. In the case of total invalidity the pension usually amounts to as much as two-thirds of the average wages that the person was earning. In case the disability is partial it is proportionate to the extent of the disability, and it is at this point that the use of the arbitration boards come in. They have to determine whether the disability is total or whether partial, and the extent of the disability.

Q. (By Mr. FARQUHAR.) Are those permanent arbitration boards or merely for a short season?—A. They are usually organized for each particular accident. I say usually; I know in some cases in the German law there is provision for a permanent board, but these boards serve without pay, and are constituted on the basis of having representatives of employers and representatives of employees, and usually one government official, and of course there must be a large number of these local boards. There is a small arbitration commission or board in each locality.

Q. (By Mr. PHILLIPS.) Is their decision final or have they a right to appeal to the court?—A. They have the right to appeal.

Q. In all cases?—A. In practically all cases. In Germany, to the imperial insurance department, which acts as a centralizing institution.

In regard to the indemnities, I should state that they are always proportionate to the wages of the employees. The dues required of the employer are apportioned to the total amount he pays out in wages, and correspondingly the indemnity that is given corresponds to it. In the case of workmen's insurance I think this is a very important provision. It is universally adopted, in order that the compensation may correspond to the scale of living that the workman has been accustomed to. Otherwise what would be an adequate compensation in one case would be thoroughly inadequate in another.

As regards the mechanism of insurance, the German system provides that employers in the same industry shall constitute or organize an insurance institution, which is independent for insurance purposes of the institutions organized for the other industries. This is necessary in order that each industry should bear its own risks, the risk of accident varying widely in different industries. The Austrian system provides for territorial institutions, but takes account of

different risks in different industries by assigning on a basis of statistical results a coefficient of risk to each industry, so that the premiums required will be in proportion to this coefficient of risk. The principle of having each industry bearing its own burden is always adopted, regardless of the particular system by which they attain this result.

Q. Is the agricultural industry embraced in this plan?—A. It is. In England the compulsory compensation act of 1897 did not relate to agricultural labor, but a law passed in 1900 has just extended the system to agricultural labor.

In further answer to that point, most nations in introducing a scheme of compulsory compensation or compulsory insurance have very wisely adopted the system of making it apply first only to particular industries in which the risk of accident is very great. This was owing to the fact that these schemes were necessarily tentative to a certain extent, as they could not determine what would be the exact charges, and the problem of harmonizing conflicting interest was great, and after the system had been well organized for a few trades, then successive laws were passed extending it to other industries, until in most countries now the system is made to apply to practically all productive industries. It is exceptional, though, that it applies to commerce; that is, stores—commercial employees.

Q. (By Mr. A. L. HARRIS.) Is the British workmen's compensation act favorably received by the employer, as a rule?—A. I have just seen recent reports giving the results of the operations of the workmen's compensation act of Great Britain, and they showed that the act has been very well received by both employers and employees. The burden of the insurance is far from as heavy as was anticipated, and, on the other hand, the expenses of litigation and of damage suits have been very materially lessened. It was quite usual in Great Britain for employers to insure against their liability—that is, before the compulsory compensation act—and the premiums that they now have to pay are not so very much heavier than those they formerly paid as insurance against their liability under the act of 1880.

Q. (By Mr. FARQUHAR.) What has been the effect of these latter amendments of the law in Great Britain on the regularly established casualty companies? Are there as many of those in existence there with this act in force as there were before it went into operation?—A. I could not say for certain, but I am very confident that it has resulted in the extension of their business. There are a large number of small employers who do not want to be bothered by the organizing of a scheme of insurance, either by themselves or in conjunction with other employers, and the simplest way for them is simply to insure in the ordinary casualty company, and they do so.

On the other hand, in such industries as railway transportation, coal mining, and iron and steel works, the practice is more and more being followed of organizing special insurance institutions. For instance, the mine owners in a particular district organize an institution which they manage and run at a minimum cost of operation, and under that system they know that they only have to pay that compensation resulting from accidents in their own establishments, and with a minimum cost of administration, and no profits, of course.

Q. This insurance, being compulsory, the money paid for premiums is taken out of the profits of these manufacturers?—A. Yes.

Q. Did you find any reason why Belgian manufacturers did not go into it?—A. I will say in regard to Belgium that the reason action has not been taken is simply a difference over the detail of elaborating a system. Bills have been constantly before the Belgian Parliament, have been indorsed by practically all parties, and have only failed of passage because the two houses could not agree upon the particular details of organization. I would, furthermore, say that a very large number of manufacturers had already voluntarily insured their employees against accidents, and that Belgium has had a national institution for insurance of workmen against accidents which employers had made use of. Also, that the insurance of miners, a very important industry in Belgium, had been compulsory for a great many years, and the railways being State railways, there was also practically compulsory compensation and insurance there, and all of the more dangerous industries were already covered in some way or other by an insurance scheme.

Q. (By Mr. C. J. HARRIS.) Is employers' liability insurance general in this country among manufacturers?—A. I think not; I think it is quite unusual.

Q. Have you investigated it?—A. Yes, I have looked into the question in this country.

Q. (By Mr. A. L. HARRIS.) Is this system of insurance a bar to any action at law on the part of the workmen?—A. In most cases the old employers' liability law remained unrespealed, the object being that in case the employer was grossly

at fault the employee could sue him for damages, and in such a case would secure an amount probably considerably in excess of that allowed under the compensation act. The purpose of leaving these laws unrepealed was to make it an object for the employers to take every possible precaution. Otherwise, the employers might say "Well, I have insured my men, and that covers everything," and would not take the precautions that should be taken, although most of the acts go into the question of the prevention of accidents as well as compensation and provide that precautions shall be taken, and make various provisions regarding that point.

Q. (By Mr. FARQUHAR.) Do you know of any of these acts which, by express provision, shut out the right of civil action?—A. No, I do not. It is possible that some of them do. The right is so rarely made use of that it does not figure to any extent except as a menace over the heads of employers to make them more careful.

Q. (By Mr. A. L. HARRIS.) Does the British workmen's compensation act have a tendency to discourage small capital from employing? You stated a moment ago that the large companies availed themselves of it and the smaller companies had to insure in a round-about way?—A. I do not think the cost would be materially different there, enough to discourage small employers, because in the establishments of small employers as a usual thing the risk of accident is apt to be less. They can exercise a closer supervision. They do not use as much machinery, and consequently the advantage is rather with the small employer.

In conclusion I would say that while these various schemes, of course, present a great many differences, yet the important point is that all recognize that accidents due to an industry should fall upon the industry as an element of the cost of production, the same as material accidents; that the employer should pay this compensation, the only exception being in some cases like that of the British act, where the employer can prove that the employee was seriously and willfully at fault; but even there the burden of proof is on the employer. That is the important point to be learned from European experience, that, as a matter of justice and principle, compulsory compensation by the employers should be adopted.

Q. (By Mr. FARQUHAR.) Has that principle been recognized by public opinion of these countries, and by their legislatures or parliaments?—A. I suppose I have talked with hundreds of people in Europe regarding this point, and, as a matter of principle—I have never talked with any one who opposed it as a principle, the only difference being as to the method, whether there should be State insurance or voluntary insurance, or optional insurance, or compulsory insurance; but as a principle it is uniformly accepted on the Continent to-day. That statement is not true of England wholly. There are in England to-day, of course, a good many manufacturers who are accustomed to the old system, who think that the law has thrown an unjust burden upon them, but those manufacturers now constitute a minority, and the principle is constantly gaining ground there.

Q. (By Mr. A. L. HARRIS.) Do I understand that the burden of proof is now thrown upon the defendant?—A. The burden of proof is now upon the employer.

Q. (By Mr. FARQUHAR.) Has there not been an open complaint in Great Britain, through trade journals and otherwise, that the enforcement of this compulsory compensation and insurance upon them has lessened their power as a competitor against the United States, where it does not exist?—A. I could not speak from the standpoint of having read a great many trade journals since the passage of this act, but the official reports state that the act is being accepted in a good spirit. But it is important in this connection to bear in mind that England is now in a very prosperous condition, and manufacturers who are making large profits would not quarrel over small extra charges. If a period of depression should come it is possible that the employers might object, and so the test of this legislation as well as most social legislation is that of hard times. But the principle is so universally accepted on the Continent, and is gaining ground in public opinion in Great Britain so rapidly, that it is practically inconceivable that any back step will be taken in regard to this matter.

In regard to American conditions, I will say that I have not made anything like the special study that I have of European conditions, but I do know that employers' liability laws in this country have far from reached the position that I have just stated is attained in Europe and Great Britain, and also that the insurance of workmen against accidents is quite exceptional. A number of the railroads have organized so-called railway relief departments, that provide for compensation in case of accident, but these funds are supported in part by deductions made from employees' wages, and there are a number of objections to this system as now organized.

Q. (By Mr. C. J. HARRIS.) Is the practice of insuring general, according to your idea in this country, and is it increasing at all?—A. The employers insure to an

increasing extent against their liability, but that, of course, is a different thing from the workmen being insured in the sense that they would receive a compensation. Employers' liability insurance is increasing quite rapidly in this country.

Q. (By Mr. LITCHMAN.) Through the regular insurance companies?—A. Through the regular insurance companies.

Q. Accident insurance companies?—A. No. There are usually special branches of employers' liability insurance. This is not accident insurance at all. The employer insures himself against any judgment that he may have to pay to an employee on account of an accident.

Q. Will that in a measure offset the quantity of insurance in foreign countries that you describe?—A. Not at all; because that is for the benefit of the employer and not for the employee. The employee never gets anything except it is the result of a law suit, and in case he does get anything the employer is then indemnified by the insurance companies.

Q. With that system of insurance would the employee be less likely to fight for damages in case of injury?—A. I do not know the system. I am not sure but what the insurance companies themselves conduct the defense sometimes, but the provisions of the contract I am not familiar with.

Q. Could you suggest anyone who could give us information along this line?—A. I think any agent of an employers' liability insurance company would be only too glad to do it. There must be agents in this city.

Q. This system is under the patronage of the government in foreign countries?—A. There are different systems. In Germany and Austria, and in one or two other countries, it practically amounts to State insurance or State control of insurance. Other countries have compulsory compensation in distinction from compulsory insurance, and provide that the employers can insure in any way they please, but the insurance must be for an amount equal to the minimum compensation required by the act; and they also provide for government supervision and report on these institutions.

Q. (By Mr. PHILLIPS.) Do you know whether any State in this Union has an employers' liability act such as you have described, or similar to those in Europe?—A. I am quite sure that no State has an act at all comparable to that of the British compensation act.

Q. (By Mr. C. J. HARRIS.) Is not all this a sort of class legislation?—A. No more than is all factory legislation.

Q. Does it apply to all employers, or does it apply simply to one class of employers?—A. As a principle it applies to all. As a matter of practical politics it was found necessary, in organizing a scheme as complicated as an insurance scheme necessarily is, that it should be first made applicable to particular industries, where the risk of accident was especially great; and after it was well organized and in good working order, and experience had been gained, it was gradually extended to other lines of industry until it has been made to cover practically all lines of industry, with the exception of such classes as salesmen and domestics.

Q. Does it include farm hands?—A. The British compensation act of 1900 extended the system to agricultural laborers.

Q. (By Mr. FARQUHAR.) Is not such insurance based on the character and grade of hazard? With the servants and professional men the hazard is not apparent to the lawmaker, is it?—A. Of course certain things a law can not do. They have to start with those cases in which the thing to be remedied is most apparent, and then extend to other cases as rapidly as they can. Now, in the case of domestic servants and salesmen the extent to which the employer is responsible for any accident that the employee may receive is exceedingly slight. In all of these systems of compensation and insurance against accidents the law expressly provides that they relate only to trade accidents. That is, if the workman is injured going to and from his work or at some other time he is not compensated. It is merely provided that the accident caused by an industry shall constitute a charge on that industry.

Q. (By Mr. C. J. HARRIS.) Would not this ultimately have the effect of lowering the wages of employees? In other words, would not the employers, figuring that their insurance liability was so much per year, be obliged to cut down wages that they would otherwise pay to that extent?—A. I think that it would to the same extent and no more than any other item in the cost of production. I think that in case of practically all of those items the charge is ultimately thrown on the consumer; it being an item of the cost of production, it enters into that cost, and prices are fixed in order to cover the cost, and it is ultimately the consumer that pays the burden; but in regard to that burden it is important to note while it makes an additional burden, on the other hand it removes a big burden, that

resulting now from the large amount of litigation which to a very considerable extent is done away with by this compulsory compensation act.

Q. (By Mr. FARQUHAR.) Does it not also remove the local care and State care of the injured?—A. It would undoubtedly have an influence on the burden of poor relief.

Q. (By Mr. C. J. HARRIS.) Would not the careless and the indolent and perhaps certain classes allow themselves to be injured to a slight degree so as to draw this pension while they were lying idle? Do they find any results of that kind in foreign countries?—A. It should be frankly admitted that that point is frequently raised in discussion regarding compensation, but that statistics of the operations of the laws throw very little light on the point whether it has resulted in increasing the carelessness or not, owing to the fact that the laws are constantly receiving extensions, and different interpretations are adopted at one time varying from what they were at another, so it is impossible to give any conclusive answer. The officials who manage these insurance institutions reply in the negative. They say it has not resulted in increasing carelessness, but we have only their personal opinion on the matter, and of course they are apt to look on it as favorably as they can.

Q. (By Mr. FARQUHAR.) In the carrying out of these insurance and compulsory-compensation acts, do the bodies of the employers and the organized workmen treat other matters than simply the insurance arbitration? Does the same body hold two functions as far as the men are concerned, or are they totally separate?—A. Totally separate.

Q. What have they in the way of advisory councils, for arbitration and settlement of general trade matters?—A. Practically all European Governments now have legislation in relation to the arbitration and conciliation of trade disputes. In France and Belgium a clear distinction is made between what are called individual disputes and collective disputes. For the settlement of the first they have had for a great many years, since the beginning of this century almost, the famous council of prud'hommes. They are in the nature of special labor courts for the purpose of settling the thousand and one little points of friction that arise, as, for instance, docking a man, or improperly fining him, or any treatment which the employee thinks is unjust, which in this country frequently gives rise to a strike. The strikes grow out of some little friction in an establishment, and the system of prud'hommes provides an arbitration, which in operation is partly a court and partly an arbitration board. Probably the best device for the settling of these smaller disputes is that of labor councils in Belgium, particularly in connection with the coal mine of Mariemont. Here the employer voluntarily organized a council on which he appoints several of his officials, and the employees in turn appoint several delegates, and that council has regular meetings, and if the employees have anything to complain of they ask their representatives to bring it before this council. This system of having a purely voluntary council in each large industrial establishment, through which the employees can express any grievance or make any complaint, seems to work very well. True, it does not always prevent strikes. When the question of an increase of wages comes up, they may suggest in this council that wages should be increased. The employer refuses and a strike results, but they have prevented the endless amount of friction about small matters that so often takes place in establishments. I have heard that somewhat similar councils have been started in a number of cases in this country, although I am unable to specify any particular cases. I remember that parties have told me from time to time that they knew of such councils here.

Q. In Great Britain has the Registrar General of Friendly Societies any authority over these arbitration boards?—A. I think not. The arbitration act of 1896 provides that the Commissioner of Labor shall assume certain functions.

Q. That is, connected with the British Board of Trade?—A. Yes, in connection with the administration of that act. But most of the legislation in Europe relating to arbitration is on the general lines of arbitration laws in this country; they provide for voluntary arbitration boards. The only compulsory-arbitration act that I know of in the world is that of New Zealand.

Q. Do you know how far recognition in the law is given to the trade unions of Great Britain through their registry under the registrar-general? That is, how much additional power are they given to sue or be sued, and as to their responsibility for the acts of individuals or for the body, etc.?—A. I would not be able to testify regarding that point in any great detail. The privilege resulting from registration is chiefly that of the right to hold property through trustees, I think, and sue in their name, and to hold them to account. Under the old system it frequently happened that a trade union had practically no redress in case of a dishonest treasurer or other official; and one of the advantages of registration is

that it is entitled to that redress. Registration practically amounts to this: The Government says, If you want to enjoy the advantages of being a regularly constituted body, you have got to be a regularly constituted body, and go before the registrar. And the conditions of registry are that they shall make a report or do certain other things, and does not limit their real freedom to any appreciable extent.

Q. In making any of these agreements or contracts that are common in Great Britain, called the trade contracts between employers and employees, as to a permanent scale of wages or a sliding scale lasting 9 months, 12 or 18 months, whatever it may be, do you know whether there is a provision in the English act that they shall be made through organized employees?—A. I do not think there is any such provision. I think all such action is unregulated. They have to settle that matter the best way they can. Of course, as a matter of fact, it is made in almost every case through an organization.

There has developed in Europe quite an elaborate system of labor councils, whose functions are somewhat different from those of arbitration boards. They are to serve the purpose more especially of furnishing an institution by which the employees can make their wishes known and bring their influence to bear upon public opinion in some way. So these councils are created in different districts, and the Government in case any social agitation comes up asks the opinion of these councils in regard to the matter; and these councils, which are constituted partly of employers and partly of employees, discuss the question and report. They furnish a means for the workmen to express their opinions. It probably works fairly well, but the conditions, of course, are peculiar. On the Continent the laborers are not organized to any extent like they are in Great Britain or even in the United States. The newspapers are to a large extent small local sheets and of no great value, and in a great many ways the employee does not have the opportunity of knowing what public opinion is or of expressing his opinion himself; and these institutions furnish a means for doing it. In this country, of course, we have the press, which is very accessible, which often champions the interests of the laboring man, and the labor organizations themselves are in a position to express in a very authoritative way the wishes of the workingman.

Q. While these remedial laws of Europe, as you are explaining them to us here, may have somewhat the character of special legislation, do they not also have many socialistic characteristics—not the socialism that concentrates, but the paternalism or socialistic feeling that regulates through a strong government having control over its people and its manufacturing industries?—A. Every piece of legislation is an exercise by the State of its authority and therefore an extension of authority; and this compulsory insurance is undoubtedly in the case of Germany and Austria, at least, very socialistic in the sense that the State interferes to such a large extent; but it can not be said to the same extent of the British compensation act or the French or Italian, which follow the British model, because they do little more than lay down general principles. The actual exercise of intervention by the State is not contemplated. They simply say that as a matter of law the employer must do a certain thing. Germany and Austria not only say he must do a certain thing, but they go ahead and organize institutions and have State control and take socialistic action in that way.

Q. (By Mr. LITCHMAN.) At the expense of the employer?—A. No; that, as far as the general expenses of administration are concerned, would be at the expense of the whole people, come out of the regular revenues; that is, the support of the imperial insurance department that controls.

Q. To that extent then it is government insurance?—A. To that extent. Germany, in addition to passing this compulsory insurance act against accidents, also provides for compulsory insurance against sickness and compulsory insurance against old age and invalidity; so that a workingman there is completely protected in case he is physically unable to work for any reason, whether he is sick or too old or meets with an accident.

Q. (By Mr. PHILLIPS.) Without regard to time of service in the particular industry?—A. In the particular industry, yes. There are certain conditions in old age, especially. The act provides that he must have belonged to the system a certain number of weeks, which amounts to a number of years.

Q. (By Mr. FARQUHAR.) What care have they taken in any part of Europe, and more especially Germany, with the tramp question?—A. Germany has a very elaborate system of institutions providing for tramps, for persons out of work. They consist partly of a sort of lodgings or shelters from which the tramp is handed on from one to the other. And they also have created about 80 so-called labor colonies, the purpose of which is to provide for the unemployed in a more permanent way. These colonies succeed in reaching only those who are permanently incapable. It is shown, for example, that a large number of

inmates have been convicted of crime. I think considerably over half the persons admitted have been in these colonies before. A great many have been there before repeatedly, and their main function seems to be to segregate that class of hopelessly inefficient which, if they were not taken care of in these colonies, would be taken care of in some other way; and I think they serve a useful purpose to that extent. Instead of herding them in jails or in a poorhouse, they go to these colonies.

Q. (By Mr. PHILLIPS.) Do they make any distinction between the criminal classes in these colonies and others who have not been convicted of crime, or are they all in together?—A. I think not, because they certainly admit large numbers that have been convicted of crime. And the reason for it is probably that persons, when they are discharged from confinement, have difficulty in securing work, and they are practically compelled to go to some such place. The evidence that many of the inmates are permanently reformed is very slight; it is known that but a small proportion of the inmates of labor colonies are ever reformed to such an extent that they can be restored to society and become independent workers again.

Q. (By Mr. FARQUHAR.) Does the state place them at labor then so that they can earn?—A. Those are not state institutions. They were originally started under private auspices. It is possible that the state subsidizes them and contributes to their support; but to a large extent they remain under private auspices.

Q. (By Mr. PHILLIPS.) They are charitable, are they?—A. To a considerable extent.

Q. (By Mr. FARQUHAR.) Are not these somewhat of a local charge, independent of the funds that have been raised for their support?—A. I am quite sure that the local authorities contribute to the support, but to what extent I could not say.

Q. (By Mr. PHILLIPS.) In Holland, in these colonies, do they not permit a man to work and allow a certain wage, and in the end give him a small parcel of land to cultivate?—A. The Dutch colonies are quite different from the German. They are more select, appeal more to the family man than they do to the single man. And the purpose there is permanent reformation. But the system is so very expensive that even if it succeeds it counts very little, because the funds allow them to help only a few families each year. That is the objection to the Dutch system—its great expense. The Australian colonies attempted to organize labor colonies in a number of cases, and considerable success was obtained, but that was chiefly due to the fact that they had large tracts of waste land which required a large amount of manual and ordinary labor; and in the clearing of that ground, and its ditching and fencing they could find employment. But in the more settled communities it is very difficult to find tracts of ground or work requiring a large amount of purely unskilled labor.

Q. (By Mr. FARQUHAR.) In your investigations in Europe you gave considerable attention to industrial communities?—A. Yes.

Q. The Krupps, for instance—would any description you could give of the Krupps to the commission probably cover all others?—A. Yes.

Q. We would be pleased to hear from that, to know what the relationship between employer and employee there is, and all the other features.—A. The conditions of Krupp were these: Krupp, as you know, started as a very small establishment, employing less than 10 employees. It was a very small business; but the industry developed so rapidly that it outstripped the housing facilities and institutions for supplying the needs of the employees; and, as a consequence, actuated partly by this necessity and partly out of a genuine desire to better the condition of the employees, there has developed at Essen, where the works are located, a very remarkable collection of institutions for the benefit of the employees. Krupp has built a number of charming industrial villages in the immediate neighborhood of his works, in which employees are lodged. He has erected public baths; he maintains schools and hospitals. He provided for the insurance of his employees long before it became compulsory for him to do so. He has one large village of cottages detached especially for the old employees that have retired. He has always taken especial care of his old employees. A person enters the works and remains there practically for life, and when unable to work the establishment takes care of him, gives him some light work to do, if possible, or otherwise just supports him absolutely. And it is extremely interesting to go through those different communities in the order in which they were erected. Take the houses that were erected 40 or 50 years ago; they are mere barracks and very bad conditions prevail there; but each successive step taken in the housing of his working people was an advance; and it is as striking an object lesson of the general improvement of conditions under which the same class of workmen live that one could well wish.

The fact, although Krupp has over 30,000 employees, that he has little or no trouble with them shows the very harmonious relations that have existed between the employer and employees there. The example at Pullman, of course, is somewhat similar to Krupp; but in that connection it is important to notice the fundamental distinction between the European laborer and the American. The American doesn't like to have things done for him. He doesn't want to consider that he is under obligations to his employer; but what he wants he wants as a right, while the continental worker does not feel that way, and in consequence there has been a remarkable development all over Europe of what they call employers' institutions. There is scarcely a large establishment there that the employer doesn't provide institutions of one kind or another for the benefit of his employees; and Krupp is probably the best example of that.

Q. You would not expect that those examples would be followed very readily in this country, where there is so much individuality?—A. I would not.

Q. You have no profit sharing nor cooperation or the industrial community?—A. A Belgian manufacturer who maintains institutions of this kind told me that the policy that he was pursuing, and that ought to be pursued, was for the employer to prepare the way for his own abdication as regards these institutions. He thought it was necessary for the employer to take the initiative and create certain institutions, because the employees would not do it, but that as rapidly as possible he should turn over the management and the control and the support of these institutions to the employees, and he is doing it. I think that in this country it would be possible in a good many cases for the employer to encourage and to foster the development of institutions, clubhouses, reading houses, baths, or the organization of cooperative societies for the provision of houses or running a cooperative store; but he should encourage the men to do these things rather than to do them himself. I think the employer can play an important part in the way of encouraging rather than himself doing it. The different feeling of the continental and American workmen, I think, explains why profit sharing has been so much more successful in Europe than in the United States. The conditions are more permanent there. The employee goes into the establishment, and he is to remain there for years and years, and consequently he becomes identified with the interests of the establishment, and it is possible to bring him under some scheme by which that identification is more complete. But in the United States, where a man doesn't know whether he will be working for that establishment six months from now or not, it is manifestly more difficult to establish any such system. And it is a question whether it is desirable to limit the mobility and the independence of the laborer to move around from place to place and seek his advantage wherever he can find it.

Cooperation is on quite a different basis. That is a case of where the men themselves organize associations for their own benefit, and one would think that in the United States such associations could develop more than they do. But the only explanation that I can think of is the lack of stability, the greater lack of stability that exists here by men moving from one place to another and from one establishment to another.

There is, in regard to cooperation, one point that I would like to speak of. In both Great Britain and France a system of cooperative contracts has developed to quite a little extent and is an interesting example of cooperation. Instead of there being a cooperative society properly speaking, a trade union will undertake a contract for doing a certain job of public work—take the contract for erecting a building, or doing the plastering for it; and the government has usually intended to foster that system of doing away with the contractor altogether. And in certain lines of work, in the building trades especially, it seems to work very well, and it is not unusual for an association of workmen, usually a trade union, to bid on a contract and get it. I know in France the law provides that contracts shall be split up into such size so that associations of workmen can bid on them, and also that they shall be exempt from the necessity of giving some bonds or other formalities which they are not in a position to meet. As an example, the building for social economy at the Paris Exposition was built entirely by associations of workmen working on this cooperative contract plan.

Q. Is this cooperative contract plan somewhat like the old form of *collegia* of Rome, where the unions contracted with the state for the furnishing of arms and ordnance and everything else?—A. I am not enough familiar with the old *collegia* to say, but the regulations which I have read regarding this kind of contracts in France provide that the associations of workmen can bid on all kinds of contracts for the performance of work or for the furnishing of supplies, so there will be nothing to prevent associations of tailors, for example, bidding to furnish uniforms for the police or fire departments. And these regulations apply not only

to the central government, but to the departments and the communes. They have the right to bid for the performance of work or for the furnishing of supplies on all public work.

Q. In Europe how far has voluntary arbitration gone, and has there been any movement there to take up compulsory arbitration?—A. Of course, it is discussed in economical publications, and bills have been brought forward, but it can hardly be said that the movement for compulsory arbitration is as strong there as it is in the United States. There is very little likelihood of any adoption of compulsory arbitration. I know in France, where the laws provide for voluntary arbitration boards, in a great many cases the parties, instead of making use of these boards, prefer to organize an arbitration board of their own for the settlement of disputes, the same way as in this country; in New York, for example, Bishop Potter and somebody else might be appealed to as arbitrators instead of resorting to the State board of arbitration.

Q. Did you find in Europe that there was a preference for trade arbitration or the immediate employer and employee in the trade arbitrating among themselves and not calling in the State authorities at all? Do you think that that system is growing in Europe?—A. It would be very difficult to say. The conditions there are really very similar to what they are here. They have systems of voluntary arbitration; they are resorted to to a certain extent, and on the other hand the employers, as I have said, frequently prefer to organize their own.

Q. (By Mr. PHILLIPS.) Have you looked into the French law in regard to conciliation and arbitration, to know whether it is progressing favorably or not?—A. Yes; I looked into the law, and I look over the annual reports of its operations as they come to the office.

Q. More people are availing themselves of that than formerly, are they not?—A. No, I would not say so. The reports for 1 year after the other are very similar, remarkably so. You find about the same number 1 year that you do another.

Q. (By Mr. FARQUHAR.) Has arbitration in these further advanced countries of Europe lessened strikes a good deal?—A. I think it has. It has undoubtedly lessened strikes growing out of small causes; it has contributed to make the general relations between employers and employees more harmonious. Practically none of these laws have contributed much toward preventing such great differences as those relating to wages. It is found there that if it is known that a manufacturer is becoming more prosperous and his profits are greater his employees will demand a share of those profits, and usually they will get something of a concession. I know of a recent case of arbitration, in 1899 or 1900, of a very severe strike of coal miners in the Loire basin. There the miners struck purely on the ground that the price of coal had gone up and the mine owners were reaping greatly increased profits. The mine owners admitted it, but said that they did not reduce wages when the price went down and they ought not to increase them when prices went up. But the miners struck, and after negotiations a voluntary board of arbitration was constituted, and that board granted an increase of wages and laid down the principle that when profits increased that way the employees ought to share in those increased profits to a certain extent, and the mine owners accepted that decision.

Q. (By Mr. PHILLIPS.) Can you briefly state the condition of the labor people in Europe as compared with the labor people in this country?—A. It is a pretty big question. What do you mean—the relative condition?

Q. Yes; the labor of this country compared with that of Europe.—A. I do not think there is any doubt but what generally the conditions of labor here are better than in any European country. There are exceptions to that statement. For instance, I believe the coal miners are better off in Europe than they are in the United States. I think their actual conditions of living there are better. They are probably better housed; they probably eat better, and they are certainly very much better off as regards stability of employment. They know that they have employment almost year in and year out in most cases. But with that exception the workingman here lives better, eats better, earns higher wages, and according to that standard is better off.

Q. In the glass industry and the iron industry, do we not compare very favorably? Are we not better off than they are there?—A. Certainly with continental Europe. Although the British workmen in the steel trade are not earning the wages they do here, they are very well off.

Q. They have more constant work, have they not?—A. They have more constant work; through various relief organizations they are better taken care of, and their requirements are not so great as they are here.

Q. (By Mr. FARQUHAR.) More contented people; practice a more even frugality of living?—A. Yes; it has more stability in every way. And what they do have,

while it may not be as much as the American gets, they are more certain of it. That is the great advantage, I think, of the European workman generally. His conditions of life are more certain. Take the German as an example. Now, whatever his condition may be in comparison to the American, the fact that he knows that if he meets with an accident incapacitating him for work he is going to receive a pension for the remainder of his life; that if he is killed there is going to be a compensation paid to his wife and children; that if he falls sick he is going to receive compensation also; and finally, when he gets unable to work as a result of old age that he will be then entitled to a pension—these are advantages that the American workman does not enjoy. Of course, the American workmen are in a position, on account of their higher wages, to make provision against those conditions, and they do it to a certain extent.

Q. Through building and loan associations, savings banks, insurance associations, etc., and still maintain his individuality?—A. Of course it is only a select few in America that do that; the persons that are most in need, the common laborers, do not do that very much. Savings-bank deposits, friendly societies, and membership in building and loan associations belong to the skilled classes; the common laborer does not do it to any great extent.

Q. (By Mr. PHILLIPS.) A very large per cent of the best paid labor use up all their money in living and do not provide for the future?—A. Yes.

Q. (By Mr. FARQUHAR.) Do you find intemperance prevailing more in Europe than here?—A. I did not notice—this is a matter of personal observation—as much drunkenness there as I do here. But all the evidence in France is that drunkenness is increasing greatly among the workmen on account of their giving up their original wine drinking for the drinking of absinthe and similar liquors.

Q. (By Mr. PHILLIPS.) Have you anything to suggest in the way of remedial legislation along any line on which you have been giving us information?—A. The question in which I am most interested, and to which I have given the most attention, is that of workmen's insurance and compulsory compensation for accidents. I should say that any action looking toward the modification of the employers' liability laws in this country, in the direction of making the employer responsible, not only for those accidents that are due to his own fault, but for those accidents the responsibility for which can not be traced—that are unavoidable—it would be a step in the right direction; and also toward modification of the law so as to throw the burden of proof upon the employer in case of an accident.

Q. Would you be willing to make us a sketch of such a law as you think would be competent to be passed on that question?—A. I do not think I would undertake to do that, on account of constitutional questions with which I would not be sufficiently familiar.

Q. (By Mr. FARQUHAR.) The employers' liability laws would rest entirely with State legislation?—A. I think any of them could enact a compulsory compensation act like that of Great Britain, which covered all the general industries and employments; and I would not hesitate to favor legislation in the States in that direction. But in response to your request as to whether I could sketch such a law I would say that taking the British act as a model would be about the best sketch for a proposed law that one could get. It would seem to me, as regards Federal legislation, that if Congress could pass an act making it compulsory upon all railway companies engaged in interstate traffic to provide accident-preventing appliances, like power brakes and automatic couplers, that it might pass a law especially for railways regarding employers' liability and increasing their liability. The reform of employers' liability laws in foreign countries in a number of cases started by passing laws specially in relation to the railway industry. Of course the railway industry is one in which the matter of accidents is most important. If the Federal Congress could pass a law making the railways responsible for the compensation of all accidents other than those due to the serious and willful misconduct of the injured employee, not the fellow-servant, that would be a very important measure and would furnish an example for the States to follow. That is, if the Federal Government would indorse the principle in such an act, it would be a great argument for the States to follow the same principle.

Q. (By Mr. PHILLIPS.) Have you any suggestions as to legislation in regard to the unemployed? Has it progressed enough in Europe to give any example to this country of anything that can be done with the large number of unemployed of various kinds?—A. I do not believe it is a question that can be reached very much by legislation.

Q. You have observed, I presume, that there has been a great effort made to secure employment for such?—A. I think the evidence is very strong that trade unions succeed in looking after their own members very adequately. The problem of unemployment is almost entirely the problem of the unemployment of

unskilled labor. While it would not be exactly in the line of legislation, I think if cities could so organize their work that requires a large amount of manual labor—such, for instance, as street sweeping or road making—with the idea in view that the service could be expanded as necessity arose for giving employment, that that would be the best way of meeting unemployment with that class, because, unless it is made in advance, the attempt to organize a special relief, in which the whole thing has to be organized from the beginning, is almost always a failure; but if provision could be made and discretion given to the local administrators to increase and decrease their force to in a measure meet the ebb and flow of the demand for employment, why I think it would go a long way toward meeting the relief of unemployment. In doing that they ought to have very careful records of whom they employ in order to know whether they are bona fide residents of the district, because if that protection is not general, why people from other sections will flock in there for the sake of getting that work.

Q. Perhaps the questions have not brought out something that you would like to state to the commission of your own motion, something that has not been covered?—A. No; I think I have covered the ground that I had outlined in my mind. (Testimony closed.)

WASHINGTON, D. C., December 14, 1900.

TESTIMONY OF PROF. WALTER A. WYCKOFF,

Assistant Professor of Political Economy, Princeton University.

The commission met at 10.50 a. m., Vice-Chairman Phillips presiding. At that time Prof. Walter A. Wyckoff, assistant professor of political economy at Princeton University, was introduced as a witness and, being duly sworn, testified as follows:

Q. (By Mr. FARQUHAR.) Please give your name and post-office address.—A. Walter A. Wyckoff; my post-office address is Princeton, N. J.; my profession is that of assistant professor of political economy in Princeton University.

Q. How long is it since you have been professor in Princeton?—A. I became a member of the faculty in 1895; I have had the position of professor since 1898, if my recollection serves me.

Q. How long have you investigated the questions relating to the conditions of the workingmen of the United States?—A. I began a personal investigation in the summer of 1891; and that investigation, which was of the nature of a personal experiment, extended from July, 1891, until February, 1893.

Q. Are the results of that investigation published?—A. They have been published simply in descriptive form; not in any other way. I hope eventually to put them into a shape which will have more direct bearing upon the scientific investigation of the conditions of this country, but so far I have given them, in published form, simply a narrative or descriptive character.

Q. If you will please state your experience and the results of your investigations, we will be pleased to hear them—in your own way; the motives that led you to it and also the results that have come from it.—A. I depend upon being asked questions. I may describe it in this way, that I was but a short time out of college, but had become interested in economic questions, and it had been suggested to me by a friend that a continued investigation of the sort that I was making—which was purely the sort of an investigation which a student would carry on in connection with the academic study of economical questions—was inadequate, and that I could get a foundation of further knowledge of economic matters by turning my investigation for a year or two into a practical trial of certain economic conditions. And his suggestion—I speak of it as his suggestion, because it was not original with me—came from a friend, a man of wide practical acquaintance with affairs in this country, and it took the shape of a proposal that I should become a workingman for a period of months or a year or two. I had no acquaintance with manual labor, no experience of manual labor, and to put myself in the position of a workingman involved my putting myself in the position of an unskilled laborer, accepting the performance of labor which would be available to any man who was without a trade, unskilled in labor. I realized my position from the first, and I also realized that the results of an investigation of that kind would have a value which would be almost entirely personal; it would be of personal value to me, but of no great value apart from the experience which I gained. But I thought that the suggestion was an admirable one, and it fitted in with my personal plans very well. So I started out one July morning from near

Fairfield, Connecticut. I went on the principle that I should not beg, but that I should rely entirely upon my ability to earn a living and to earn it by the work of my hands. So I set out; but it was some days before I hit upon a plan which seemed to me to be one which I could carry through to the end of my investigation. So far as the investigation was concerned, I had only this very indefinite idea, that I would, starting from the Atlantic coast, reach the Pacific coast before ending my experiment; and, as I say, I had not been many days in this investigation before I hit upon the plan which seemed to me to be on the whole the best; and that was to accept more or less permanent jobs instead of looking for a chance job here and there to earn a meal or a night's lodging—to see what I could find in the way of permanent employment, not in order that I might make it permanent employment for myself, but these jobs which I secured would be in the nature of work that if a man did accept them he might make them permanent for himself—giving at least that degree of value to the experiment. I got work first with a gang of laborers at the post at West Point. The Academy building was being destroyed to give place to a new building, and immediately upon my application to the boss I was given work with his men.

Q. (By Mr. PHILLIPS.) How many days had you been out at this time?—A. I had been out just a week then, living by chance jobs—that is, being given work to saw wood or something of that sort and getting in payment a night's lodging, or a meal, or whatever I needed. But as I say, the results of a week's experience of that sort of thing was that I found that it was unsatisfactory and I was not getting any results; therefore I adopted this plan of securing more permanent work. I was surprised at the readiness with which I found employment. I walked to Highland Falls, got a place in a mechanics' boarding house there, and there I stayed for a week working on the ruins of the Old Academic Building. It gave me the opportunity of very intimate association with the other men, gave me a chance to see how they lived, and, in the personal contact with the men to follow their ways of thinking and their ways of looking at labor questions and their general attitude toward life. I may say that I soon found it necessary to stop that sort of work for the time being at least; the strain was very severe and I was new to manual labor. I found that my hands were lacerated and I had to give it up at the end of a week and seek other employment. I went on from there only a day's march and, driven to shelter by the rain at a hotel up in the Highlands, I applied for work and was taken on as a porter; and, seeing the opportunity of investigating something of the condition of life among domestic servants, I stayed on there for a period of about 3 weeks, filling the position of hotel porter. When I had stayed there that length of time I concluded that there was nothing more special that I could gain; so I started out again early one morning and walked as far as Middletown in Orange County. There I began to look for work, and was given it digging a sewer on the grounds of the Homeopathic Insane Asylum near Middletown, Orange County, N. Y. In this way I continued my progress westward, simply looking for work of this kind, accepting any form of work that offered provided it was honest, and living with the other workmen. I next worked with a farmer a little west of Wilkesbarre, Pa., and after a week's stay with him, I found a place in a logging camp in the Allegheny Mountains.

Q. Will you please state about how much money you earned? I would like to know how you progressed from one place to another, and if you saved any money.—A. My wages varied. At the first job where I was engaged, at the Old Academy Building, I received \$1.60 a day. I paid \$5 a week for my board. The savings, of course, applied simply to the week's work, and they were very little, and were entirely taken up in the payment of my week's board; and in payment also for the necessary things which I had to get. I had but one suit of clothes, and I had to get a suit of jeans to cover and protect them, because they were the only garments I had with me, and I meant to live entirely by the work of my hands and to purchase my own clothing as well as my support in every other way.

I will say in regard to the next employment, that of hotel porter, I was paid at the rate of \$3 a month and my keep. There were no expenses, and what I had earned in the course of my stay there was clear gain, excepting that I had worn my boots out and had to have them renewed, so that the little balance I had left was, as I remember, slightly under \$3, and this served to purchase food on the road to Middletown and prevent the necessity of going without either food or shelter at night until I got a job again at Middletown. There I saved my wages, and for something more than a week's stay my savings were sufficient to secure food and lodging until I got another job with a farmer near Wilkesbarre.

I walked along the country road because—though it was perfectly obvious that my savings were such that I could have gone by rail and covered the distance in very much shorter time—this walking gave me opportunities for frequent contact

with the farmers and frequent opportunities of work with farmers. I had a number of conversations with them and always, as far as possible, drew them into conversation in regard to political and social matters in which they as a class might be interested, and I gained much of the most valuable experience to me from contact with these men.

I might say that in no instance did I save a sum of money which represented possible accumulations in the various occupations. As soon as I had saved a little from one occupation, I exhausted that little sum in going on in the country until my funds gave out, and then I was obliged to seek other employment.
